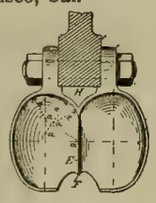
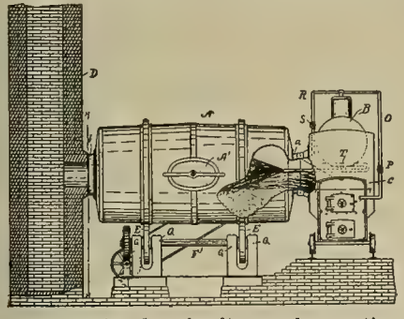
Specially Reported for the MINING AND SCIENTIFIC PRESS.

RIFFLE PLATE FOR ORE STAMP BATTERIES.—No. 632,954; H. Tuttle, Quartz, Cal.



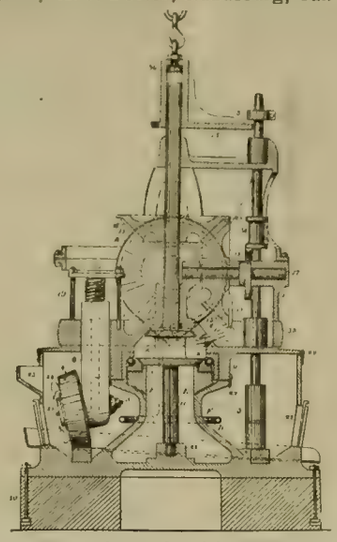
In a stamp battery, the combination with the mortar provided with a pulp outlet opening, of a chuck arranged therein, and of the riffle plate secured to the inner face of the chuck block and extending into the mortar to a point opposite the stamp, plate having its upper face provided with a series of collecting pockets, grooves or channels within which is collected the amalgam; the riffle plate extending from the screen opening downward to a point adjacent to the lower edge of the chuck block, opposite the stamp.

MECHANICAL DRIER.—No. 633,123; F. D. Cummer, Cleveland, Ohio.



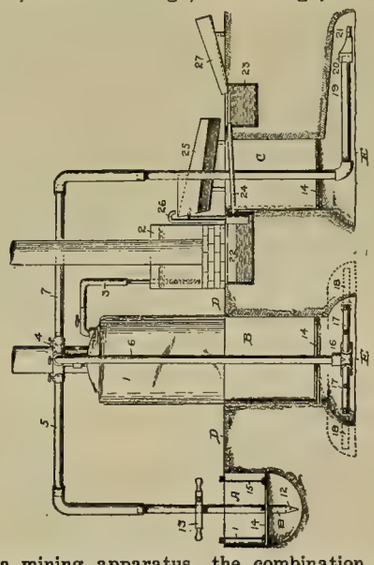
A cylinder having inlet openings between its ends and passages from openings to interior of the cylinder having the shell of the cylinder forming the outer wall thereof and inside coverings substantially parallel to shell, forming the inner walls of passages.

TANGENTIAL WATER WHEEL.—No. 633,184; W. A. Doble, San Francisco, Cal.



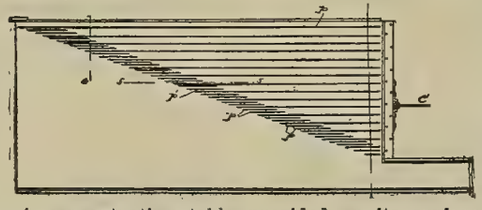
In a tangential water wheel, a series of buckets each consisting of a shell comprising two ellipsoidal cavities in proximity divided by a central wedge-shaped ridge in the plane of the wheel, a clearance passage for the stream at the outer extremity of wedge-shaped ridge, through adjoining margins of the ellipsoidal cavities, whereby the stream is partially surrounded by but not impeded by cavities, the ridge alone encountering the stream and dividing the same, and the cavities serving to deflect the split portions thereof and gradually change the direction of their motion to reversal.

APPARATUS FOR ROASTING REFRACTORY ORES.—No. 633,278; R. A. Stewart, Cerrillos, New Mexico.



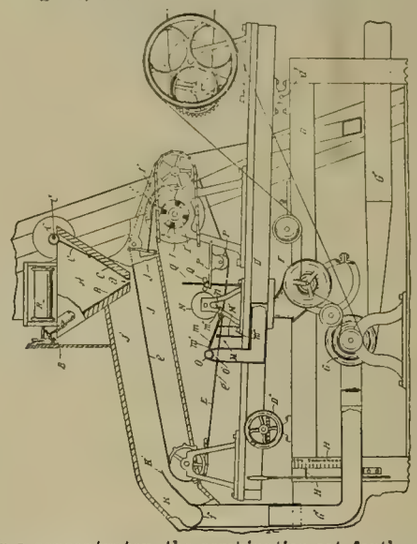
In an apparatus for simultaneously roasting and oxidizing refractory ores, the combination of a rotary ore-retaining cylinder provided with a manhole or holes through which the same is filled and emptied; two pairs of cylinder supporting roller bearings, each pair respectively being located beneath and upon the respective sides of the longitudinal axis of cylinder and connected together by a supporting shaft; a driving gear connected with the shaft of one of pairs of roller bearings; means for communicating motion to driving gear; a draft flue or chimney; a furnace communicating through the interior of cylinder to chimney; a steam generator located above furnace; a steam pipe communicating from the boiler through a steam coil located in the furnace, and from thence into rotary ore cylinder; and a second steam pipe also communicating from boiler to a distributing pipe provided with slots or perforations within the furnace.

STAMP AND BOILER CRUSHER AND PULVERIZER.—No. 633,248; A. J. Petter, Randsburg, Cal.



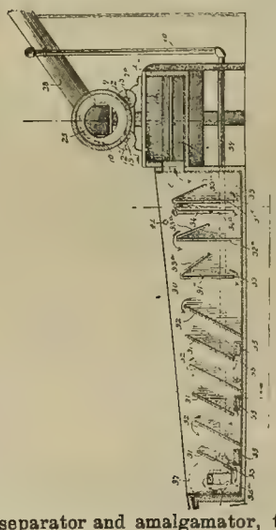
In an apparatus for pulverizing ores, an annular mortar with corresponding die or dies fixed therein, a framework with anti-friction bearings and a vertical central shaft, stamps the stems of which are vertically guided in lines above the die, a mechanism including horizontal shafts and driven gears, and cams on shafts, by which the stems are raised and allowed to drop with an oblique sweeping grinding movement, vertically moving spring-pressed standards carried by the frame intermediate between the stamps, inclined shafts journaled in the lower ends of the standards, and rollers fixed upon shafts, rollers having conical faces converging outwardly, so that the lower faces of rollers travel upon dies and produce a sweeping or grinding action thereon.

APPARATUS FOR MINING PRECIOUS METALS.—No. 633,397; S. R. Stambaugh, Chattanooga, Tenn.



In a mining apparatus, the combination with a steam generator of a shaft sinker, consisting of an open pipe, an excavation closure through which the pipe loosely passes, a flexible pipe connecting the shaft sinker to the steam generator which permits lateral and vertical movement of the shaft sinker when in use, means for manipulating the shaft sinker in relation to the closure, and means for raising and lowering closure independently of the shaft sinker.

CONCENTRATING TABLE.—No. 633,265; U. S. James, Helena, Mont.



A concentrating table provided on its surface with series of parallel, longitudinal riffles extending from the forward end rearward and terminating short of the rear end of the table, on a substantially diagonal line running downward and rearward, and a series of supplemental riffles interposed between the rear extremities of the riffles. A concentrating table having its feed point at its forward upper corner and provided on its face with a series of parallel riffles tapering rearward and extending from the forward end of the table to a line running diagonally across the table from near the feed point rearward and downward, and a series of supplemental riffles interposed between the rear extremities of the aforesaid riffles, cross pieces binding the strips together, grooves or cuts being formed across the table coincidently with cross pieces, a flexible cover fastened to the table and covering grooves or cuts, and riffles carried by cover and made flexible transversely.

DRY CONCENTRATOR.—No. 633,254; F. W. Wood, Los Angeles, Cal.

In a concentrator, the combination set forth of a pervious traveling belt; means for feeding ore upon the belt; means for forcing air through the belt; a shutter movable toward and from the belt; and an exhaust having its intake above the shutter. A closed chamber arranged above the belt; an exhaust passage leading from the closed chamber; a movable shutter arranged to form the lower wall of the mouth of the exhaust passage and adapted to be adjusted toward and from the traveling belt. A base frame; a movable frame pivoted to the base frame and carrying a pervious concentrating belt; a blower for forcing air through the belt; a valve for regulating the air admitted to the blower; a scale arranged upon the blower frame; a pointer secured to the valve and pointing to the scale; a scale arranged upon the base frame; a pointer secured to the movable frame and pointing to the scale upon the base frame; and means for adjusting the movable frame with relation to the base frame.

ORE SEPARATOR AND AMALGAMATOR.—No. 633,445; H. Fuller, Chicago, Ill.

In an ore separator and amalgamator, the combination of a settling chamber provided with a plurality of amalgamated plates arranged to form a tortuous passage within chamber for tranquilizing the flow of ore washings therethrough, an overflow spout *42* at the discharge end of chamber, a return pipe connected to the settling chamber at its discharge end and near the bottom thereof, an outlet pipe *36* over the end of the return water pipe and having its upper end terminating in the settling chamber on a plane between the overflow spout and the open receiving end of the return water pipe, and a pump.

Mining Summary.

ALASKA.

The Alaska-Treadwell M. Co. estimate that they have blocked out and in sight 4,000,000 tons of ore between their 220 level and 440 level; besides, above the 220 level there is at least an equal amount, or 8,000,000 tons in all.

Captain Richardson, of the United States Army, has been succeeded in command of the Yukon soldiery by Colonel Ray. Captain Walker spent several weeks at Cape Nome before his return. He says "the district is one of great richness, but says 1200 or 1500 people must leave before the close of navigation in order to avoid distress. Should all of the present population attempt to pass the winter at Cape Nome, he believes there will be a shortage of both provisions and fuel. The beach wood supply is already running short. The steamship Alliance brings news that 380 Cape Nome beach miners were arrested in August in a body by United States soldiers stationed there on complaint of the Cape Nome M. & Dev. Co., which claimed the beach. The men were marched from their diggings into Anvil City. The United States steamer Bear was in port and her commander after investigating, told the officials that the United States owns the shore line from 16 feet above high-tide land to three miles out to sea, and I am in control. No man can get title to this and none can prevent another from working the beach. The 380 men who had been marched away from their work marched back again and resumed their labor. At an election held at Anvil City the name of Anvil City was changed to Nome. Two thousand miners cast their votes. A mayor and a full set of municipal officers were elected."

ARIZONA.

COCHISE COUNTY.

Tombstone *Citizen*: It is reported that options have been given on the Tough Nut, Grand Central and other properties which made Tombstone in 1883-4. There are ninety-two claims in Tombstone district, which have made a record of $32,000,000 output in a few years. E. B. Gage of Congress, Mr. Dean of Los Angeles and a Mr. Cheney have large interests in the district. The water problem will be solved first, the mines being flooded. It is thought that gold will be an important product.

GILA COUNTY.

Phœnix *Republican*: The Gun creek district, in the upper Tonto country, seventy-five miles from Globe, has come to the front this season as a promising mining region. The discoveries are on a strip seven miles in length, on which some rich copper ore and gold have been found.

Globe *Silver Belt*: The Ray Copper Co., Ltd., has 300 men employed. The railroad surveys are completed, and construction work on the narrow gauge road from the mines to the Gila river, at the mouth of Mineral creek, is to begin. Pending the construction of the railroad a large traction engine will haul machinery and supplies from the Southern Pacific to the Gila river. The reduction plant to be erected on the Gila, it is reported, will have a capacity of 1240 tons.

MOJAVE COUNTY.

The White Hills Co. is operating in the White Hills. The company owns forty-four patented claims and thirty that are unpatented. From some of these very rich silver ore has been produced and shipped. Some of the properties return good values in gold. The company's payroll is $8000 to $10,000 per month. The company also owns water rights, a 20-stamp mill, telegraph and telephone lines, boarding houses and store.

Kingman *Miner*: In cutting into the foot wall of the De la Fontain mine a few days ago, for the purpose of putting in wall plates, the workmen found a streak of lead ore which developed into a 3-foot streak of solid ore.

PIMA COUNTY.

Tucson *Star*: The copper mines of this county are making a daily output of more than twenty tons of metal, where there was not one pound of copper produced in this county ten months ago.

YAVAPAI COUNTY.

Jerome *Reporter*: On the Agua Fria, south of Bowers' ranch, near Big Bug mining district, the Val Verde Copper Co. is working on the new smelter and town site. The company expects to have its plant completed in sixty days.

YUMA COUNTY.

The Fortuna mine, near Yuma, is reported to be turning out an average of $50,000 per month, at a clear profit of more than $40,000. The quartz of this mine is glassy and unpromising to the eye of the average miner, but it has a redeeming feature in containing gold enough to make it pay handsomely.

CALIFORNIA.

Amador.

Jackson *Republican*: The mills at the old Empire dump are idle owing to lack of water. ——The Ivanhoe mine, near Plymouth, has been closed down, due to a scarcity of water. ——The North California mine at Plymouth, near the Pocahontas, is being worked by El Dorado county people, and the Gowanis mine, in the same district, is in charge of Des Moines, Ia., people.——A rich ledge was encountered in the Bay State mine, four miles north of Plymouth, last week, the extent of which is not known. Sinking and development work are in progress.——The grading for a 60-stamp mill has begun at the Oneida. The machinery will be on the ground within three months.

Record: Sinking at the Lincoln mine is progressing. The shaft is down 1130 feet. A crosscut is being run at the 500 level for the west vein channel, in about 100 feet. The north drift is in a mixture of quartz and slate. It is the intention to install power drills.—— The recent strike in the Keystone on the 800 level was made a little east of the old south shaft. The first day, it is reported, $5000 was taken out and $10,000 more was in sight. The gold was brought up in sacks. A nugget measuring 18 inches in length, 8 inches in width and ¾ inch thick was taken out Friday. It was of pure gold. The pocket is in hard ground and had to be blasted out.

Sutter Creek *Record*: The Emerson shaft of the Wildman has closed down owing to shortage of water.——At the Bunker Hill mine work is to be started.——Ground is being cleared for the foundation of a 60-stamp mill at the Oneida mine.——At the South Eureka the shaft is down 1790 feet. After the 1800 level is reached and a sump sunk, drifts will be run.——The Hepburn G. M. Co., owner of the Bellwether mine, near Jackson, has resumed work. Supt. W. A. Knapp is repairing the shaft, preparatory to sinking.

Calaveras.

Work has been resumed on the Ford mine at San Andreas.

The Republic mine near Kentucky House, south of San Andreas, is to resume work, having been provided with a new pump.

The copper mines at Copperopolis are being unwatered. John Gorham has been appointed foreman.

M. E. Muldoon and J. Plant, of Jackson, have men at work on the Acme and Tiger mines, north of the Gwin.

The St. Lawrence mine, south of Angels, which started up a few months ago, is looking well. The shaft is down 400 feet and levels are being run north. The rock shows a good prospect and it is reported if it continues a 60-stamp mill will be erected. The present operators have a bond on the property from the Brunner estate.

Mokelumne Hill *Chronicle*: Operations on the Kramer mine on Golden Gate mountain are being carried on under the superintendency of J. M. Carpenter. Air pipe has been put in and the old tunnel is open 600 feet. It is expected to strike pay gravel at 1500 feet.

Del Norte.

The citizens of Crescent City are taking preliminary steps looking to the establishment of a copper smelter at that place. They claim a large amount of ore in sight, which will not bear shipment and charges, which it would pay to smelt near the mines.

Kern.

Randsburg *Miner*: This week J. A. Gowan of Long Beach paid Hanson & O'Leary $10,000 for their two-thirds interest in the Defender, Single Standard and Little Bonanza claims, 10% down. A shaft will be sunk to 500 feet.

Kings.

This county has a deposit of terracotta clay, also gypsum, sulphur, fuller's earth and other minerals of economic value, besides an oil belt of promise.

Madera.

The mines of the California Copper Co., at Daulton, are controlled by the owners of the Mother Lode mine, at Greenwood, B. C.

Mariposa.

Jos. F. Josephs of Sonora is reopening the Ferguson mine on the north fork of the Merced river. The mine is reached by way of Big Oak Flat and Bower's cave. There is no road within several miles of the mine, and never has been. Over rough mountain trails in the early days heavy machinery was "packed" to the mine, including a 10-stamp mill, of which the mortars each weighed 4500 pounds. The mine was worked to the water line. There is a small amount of ore still available above the adit level. A shaft will be sunk and a mill built from the material on the site, most of which is in good condition. The Ferguson is a short distance from the Hite mine and presumed to be on the same fissure system.

Mariposa *Gazette*: Not for over a quarter of a century past has the Mariposa Grant had such a promising outlook as at present. At Bear valley, Princeton, and Mariposa, every day teams loaded with lumber, machinery and other implements of mining industry are coming from various quarters.—— Work has commenced on the Mariposa mine by the company. Wm. Dodge is foreman and Thomas Dale night boss. Men are grading and cleaning out the old roads to the mine and grading for a shop and other buildings. The lower tunnel is to be cleaned out, retimbered, and a track put in. The opening of the old Mariposa mine is now under way. During the week a night shift was put on.——Princeton has made the greatest improvement. Miners are working in the old shaft and are down over 100 feet. Joseph Thomas, formerly of Nevada City, Cal., is in charge at Princeton. Back of Princeton the company has completed a warehouse and several large buildings are going up. Headquarters of the company is to be at Princeton and residences for the manager and different officers of the company will be erected there. ——The Pine Tree and Josephine mines are two miles north of Bear valley. Twenty men are employed in these mines, under A. H. Pearce. A number of buildings to accommodate the workmen are being built. The lower tunnel on the Pine Tree has been cleaned out to a distance of 575 feet, and the work will continue to the old shaft, which is in 750 feet. This shaft was sunk 250 feet below the tunnel level. The intention is to continue the shaft to connect with the Benton mill tunnel, which will be driven ahead. At the Josephine two lateral drifts will be run — one south from crosscut No. 2 and one north from crosscut No. 1.——Last week the remnant of the old dam at the Benton mills was burned to clear away the debris.

Mariposa *Gazette*: It is reported that the Mt. Gaines mine, west of Hornitos, will adopt a new scale of wages on Oct. 1st, paying miners $3 a day and muckers $2.50; board 75c a day. With these wages the Mt. Gaines expects to get good men.

Nevada.

The 5-stamp mill at the Orleans mine has been started. Recently a new ledge was struck in the mine, 2 feet wide, but no mill test has been made.

Nevada City *Herald*: J. L. Postlethwaite has struck the ledge in the McKinley mine, Willow Valley district. It is 1 foot thick and looks well. The McKinley is owned by a Tacoma, Wash., syndicate headed by Bowen and St. John, who will erect a 10-stamp mill on it this fall and put in an air compressor.

Placer.

Placer county, during a period of eighteen years, from 1880 to 1898, inclusive, produced $21,598,576, and it is estimated that prior to that not less than $43,000,000 came from the mines of this county, the greater part, over 90%, coming from hydraulic, drift and placer mines.

Auburn *Herald*: I. Meyer has sold his interest in the copper mine at Whisky Hill. The ore carried from $3.75 to $6 in gold and $25 per ton in copper. Mr. Meyer has formed a company for working tailings in Auburn ravine by the hydraulic elevator process. The company has bought the Wall and Sickles farms and is negotiating for the Symmes farm at Gold Hill. Work will be begun near the upper end of the Fagg farm. The water will be taken from Chili hill; 11,000 feet of iron pipe will be required.——Supt. J. E. Walsh expects to start work at the Gold Blossom, near Ophir, October 1st.——The shaft at the Bullion, an extension of the Bellevue, in Ophir district, is nearly pumped out. The company will begin sinking as soon as the ground is drained. A wheel 36 feet in diameter will furnish power for hoisting.—— In the three shafts sunk at the Three Star mine quartz has been struck in each and levels have been run. The company is doing prospect work before putting up reduction works.——C. A. Reed brought from the mountains fine copper ore from the Oro Fino mine at Meadow Lake. But few prospectors are here this summer.——It is reported the pay chute at the Pioneer, near Damascus, has been struck again.

Plumas.

It is reported a rich gold strike has been made in the Beckwith pass.

San Bernardino.

Mrs. Clara Foltz of San Francisco is reported to have taken up 640 acres in Holcomb valley, and proposes to prospect it for gold. The placer mines of both lower and upper Holcomb valley have been worked by various parties, the largest operations being conducted by the Holcomb Valley Co., Ltd., of London, under the direction of J. R. Thame. A steam shovel was employed in this work and a large amount of ground sluiced. A shortage of water and lack of grade limited the operations to the conditions found, and although gold was found the mines did not pay.

A large force is to be put on the Gold Mountain mines, four miles east of Holcomb Valley. The property has recently been bought by J. R. De Lamar from E. J. Baldwin of San Francisco. The ore (quartzite) all contains gold, but little of it is free. Tests have shown that the cyanide process will successfully treat it. It is a blanket vein which was worked years ago by Mr. Baldwin, by the open cut system. A 40-stamp mill was constructed at the foot of the hill, near the mines, but proved a failure as the ore did not contain sufficient gold that would amalgamate, to make it pay. The little village near the mill was known as Blairstown. The mill was burned several years ago, since which time nothing has been done with the Gold Mountain mine, though Hayward & Lane of the Utica mine at Angels, Cal., did some prospecting on other locations in the neighborhood in 1896, put in a test mill and abandoned the enterprise, presumably for the same reason that Baldwin abandoned it.

San Diego.

The first discovery of gold in the Julian district was made on Coleman creek by a woman in 1869, in the bed of the creek.

There are gold prospects southeast of Dulzura, near the Sheckler ranch, that have never been developed, though promising.

Shasta.

(Special Correspondence).—E. P. Conners is developing six claims and putting the old works in repair. There are 100 tons of ore on the dump which will be put through the 5-stamp mill when rains have furnished power. The stamps weigh 850 pounds each.

Ten miles west of Redding, on Clear creek, E. P. Conners is opening claims on which are said to be twenty ledges, 1 to 20 feet in width. The ore is suited to the smelting process. A test made by cyanide averaged $46 a ton. There is no cyanide plant in operation in this county.

Boswell & Johnson, at Harrison gulch, have reached 600 feet in a 6x6 tunnel. According to surveys, they expect to cut the ledge found on the surface in another 100 feet, at which point they will have a vertical depth of 700 feet.

Shasta, Sept. 25th, '99.

The Mountain Copper Co. are making an average output of 2200 tons of ore daily. The ore during 1898 returned about 8⅛% copper. The company buys 1800 tons of ore for fluxing from the neighboring mines, paying therefor 90% of the gold on ore containing over $20 per ton. On ores running under $20 in gold they pay 70% of the assay value. The charges on all grades of fluxing ores are $3.50 per ton. Last year they bought 175,000 tons of ore of this character.

The ore bodies of Copper City occur in feldspar porphyry, which has intruded the slates in large bodies. So broad are these masses that they would not be recognized as dykes. The ore bodies are zones of infiltration, occurring where the porphyry has been fractured and crushed. They could not be called veins. The veins of the district are defined quartz ledges, but are barren. The ore is gray copper, containing gold, silver, antimony and copper. Zincblende and galena are also often found. The ores at and near the surface are oxidized and porous, of dull red color, and the gold mostly free, the other minerals occurring as carbonates and oxides. No quartz is found in the gangue, but in its stead a large amount of heavy spar and calcite, derived from the alteration of the porphyry. At Bully Hill, two miles north of Copper City, the geological conditions are similar to those at the latter place. The red croppings are visible for a long distance. The oxidized surface ores have been mined and milled, and they have also supplied a large amount of gold to the neighboring gulches, which have been worked extensively. The ore bodies have mostly been worked down to unoxidized ore. At the Iron Mountain mines the ore bodies are found in fine-grained quartz porphyry.

Siskiyou.

Yreka *Journal*: Angle & Brown found a rich pocket of quartz on Mount Sterling, fourteen miles west of Cole's, in the Siskiyou foothills, last week. They brought down forty-six pounds of the quartz, full of gold—one solid nugget of gold weighing thirty ounces. At the foot of the mountain there are placer claims, but water is scarce at present to do much development work. These mines are between the head of Main Beaver and the West Fork of Beaver, north of Hungry creek.

Yreka *Journal*: Wetzel, Harmon & Ridenhour, who bought the Greenhorn Blue Gravel mine recently, sold out for $10,000 to Lezsinsky, Page & Heard, who paid $3000 down and the balance in 60 and 120 days. The new owners have commenced operations and will sink another shaft.——Martin & Perkins have sold their ledge on Sucker creek, in Humbug district, for $2500, to M. A. Mitchell of Ashland, Or. The new owner intends, after prospecting, to put up a mill.——The mill of the Commodore mine at Barkhouse, Klamath river, is to be increased in capacity to ten stamps. This is one of the best paying mines in the county, the monthly yield being several thousand dollars per month from an 18-inch vein.

Trinity.

Weaverville *Journal*: J. B. Graves, who is now sole owner of the Blue Jay on Morrison gulch, recently took out a pocket of $2000. It was struck 80 feet from the location of the former large pocket, 140 feet from the mouth of the tunnel and 150 feet below the surface of the ground.

Tuolumne.

A fire recently burned out all the timber in the Beckwith mine at Sonora, from the 100 level to the surface, and also destroyed some buildings and machinery.

From the most authentic sources it is learned that the reports of a rich strike in the Longfellow were not in the least exaggerated. The property lies in a district transfixed by both the east belt and the mother lode, neither the wealth-yielding quartz nor stability of which can be questioned. Nevertheless it was said that the Longfellow and all the other mines in that section, despite proof positive to the contrary, were nothing but pocket formations, the value of which could only be estimated by the amount of ore in sight. In the Longfellow, at Big Oak Flat, rich ore was struck at 130 feet, but after following the pay streak for a considerable distance it apparently gave out. When sinking was resumed the main shaft was driven down to 300 feet, when a station was cut and drifting begun. In this drift the shoot was again found, and it has been exposed for a considerable distance with no sign of an end. The 10-stamp mill is crushing night and day. Sinking in the shaft continues.

COLORADO.

CHAFFEE COUNTY.

M. Leonardy has received from the Arkansas Valley smelter $450 for a seven-ton lot of ore shipped from a recent copper discovery. The discovery is on the Big Chief mine, one mile from Riverside.

EL PASO COUNTY.

A strike is reported on a claim owned by Davis & Goodrich, six miles south of Woodland Park, where a 2-foot vein of ore rich in gold and tellurium has been found. It is on the north side of Pike's Peak.

GILPIN COUNTY.

Central City *Register-Call*: A larger plant of machinery is to be installed by the Colorado Springs parties operating the Modoc mine on Quartz hill.——Mgr. Vivian of the Notaway G. & C. M. Co., operating in Russell mining district, reports the shaft down 200 feet and a contract will be let to sink an additional 100 feet. There is 3 feet of ore in sight. The company is buying additional claims.——Two loads of ore were hauled from the Mechanics lode on Gunnell hill Tuesday to the mills for a test. The property is being being worked by Henry Bolthoff of Hendrie & Bolthoff of Denver.

GUNNISON COUNTY.

Crystal *Lance*: The water has been taken out of the Graham, and before mining work can begin some method of ventilation will have to be put in. The prospect is a good one. ——A number of properties about Gothic and Elko are making arrangements to work through the winter steadily.——H. G. Ingersoll is taking out ore for a test shipment from the Harper property on Galena mountain.—— It is reported the Carbonate is to be equipped with machinery, as it would require a long tunnel to cut the property, and it is deemed wise to explore to a greater depth before driving a tunnel.——Oliver Thomas is hauling 100 tons of ore from Crystal basin for shipment to the valley smelters—the largest single shipment made by any one prospect this season.——The fourth car of ore from the Caledon and Atlantis in Silver Basin has been shipped to Pueblo. The ore is silver-lead. ——Last week J. Magee sold his interest in the Steve Day lease to the Attix company, who have been his partners and have been

carrying forward the work in the properties. The company is calculating to erect a mill for the concentration of their low-grade product. They are also arranging to have ample storage room for ore and concentrates taken out during the winter, when shipments cannot be made.

HINSDALE COUNTY.

Pierce & Kilvert of the Golden Fleece mine have a bond and lease on the Silver Bell group on Henson creek, near Lake City, and have started a tunnel to tap the vein 300 feet from the surface. The ore streak, which is lead and gray copper, is 2 to 4 feet in width.

The Hidden Treasure Co. is putting out thirty tons per day of concentrates. The Ute is putting out ten tons of concentrates per day. The Lillie mine is shipping eight cars per month of crude ore.

The Vermont tunnel is in about 500 feet and in 1700 feet, according to survey, will tap the Vermont vein. This is backed by A. E. Reynolds.

The Czar mine at Capitol City is being operated by a Denver company, and from recent reports a large body of solid lead ore has been found.

LAKE COUNTY.

Leadville *Miner*: The Wolftone shaft is to go down 1500 feet and $150,000 is being expended in enlarging the shaft, unwatering and making the improvements. A battery of seven 100 H. P. boilers of 150 pounds pressure is to be installed. The double hoisting engine will be 125 H. P. Large station pumps are also to be put in, which will raise 1200 gallons 1200 feet per minute. The A. M. W. combination tonnage will be large and large reserves of milling ore are exposed.——The Midas shaft is now down 440 feet and the contractors are making good headway. At 520 feet it will reach the ore chute proven by drifts from the Penrose. The ore is 18-ounce iron and lead carbonate. Within the combination's ground are the Maid of Erin, Wolftone and Adams, which have yielded $13,000,000. The Adams has large bodies of copper sulphides at depth.

MINERAL COUNTY.

Creede *Candle*: The vein has been struck in the Commodore tunnel No. 5 and the ore has been opened up a width of 6½ feet and its limits not reached. The ore averages over 300 ounces in silver and a high per cent in lead. The output from the Commodore since the resumption of work has been about 200 tons per day.

SAN JUAN COUNTY.

In Arrastra basin, the Iowa mine employs 110 men, the Tiger 40, and the Silver Lake 220.

Silverton *Miner*: C. F. Holley of Aztec, who has been prospecting in the Needle mountains for several months, has found ore which assays: gold, 5 12-100 ounces; silver, 1090 ounces. The ore was broken from the face of a 500-foot tunnel on an old property heretofore considered low grade, although at one time a shipper. The mineral is petzite and was taken from a 2-inch streak lying alongside a 4-foot body of mixed quartz and lead. The Ætna, in Needles district, is being operated by J. H. Swarthout of Stanford, Connecticut. The Needle Notch M. Co. have bought six claims in Vallecito basin, among them the Swan and Blum for $25,000. The company contemplates the erection of a power house at Needleton to operate a mill in the basin, a distance of seven miles.

Silverton *Miner*: The Boston & Silverton Exploitation Co., operating the Uncle Sam group, is building a mill of seventy tons capacity, which will probably be running by Oct. 1st. It is said that a 7500-foot tram line, connecting the present workings of the Uncle Sam with the mill, is to be put in. The crosscut tunnel to intersect the Uncle Sam group is 300 feet in, with 3000 feet farther to run. When the mill power is established, power drills will be utilized in the tunnel.——At the Gold King the new addition to the mill building is completed, and the machinery, consisting of crusher, ten stamps, tables, etc., is being put in. The mill has been closed down for a few days. It will now consist of forty stamps. The mining force will be increased by forty men. Average amount of ore going over the tram line daily exceeds 100 tons, which amount will be doubled upon the starting up of the mill.

SUMMIT COUNTY.

Leadville *Chronicle*: The Iron Mask is running full blast. The new bins are full of ore. New machinery was recently put in. It is expected this mine will ship fifty or seventy-five tons a day.——The Col. Sellers is still the largest producer, 100 tons a day being shipped. In a few weeks the output will be larger.——J. C. Gilroy and others have a lease on the Nettie B and are shipping sulphide ore which carries a large percentage of lead. Steady shipments are being made.——The Snow Bank, another property showing large bodies of sulphide ore, will be added to the list of shippers. G. T. McDonald is Supt.——At the Mountain Lion W. C. Tracy has opened up copper sulphide ore which shows good gold and copper values.

TELLER COUNTY.

(Special Correspondence). — The Teutonic Con. G. M. Co. have property on Bull hill, Raven hill and Copper mountain. M. E. O'Bryan is president and Chas. N. Miller secretary and treasurer. Their Bull hill holdings are being worked under lease by the Rex Investment Co. The lessees are sinking a shaft and preparing to put in machinery for further work.

The Specimen lease on Bull hill was sold by the Rex Investment Co. for $5000. The lease runs to 1901.

The Modoc has opened a new vein, heretofore undiscovered, running parallel to the old vein. The new vein has been opened on the fifth, seventh and ninth levels. On the fifth the values run $20 to $80 per ton; on the seventh the vein is about 4½ feet wide and runs from $40 to $70 per ton, rich streaks going as high as 10 to 200 ounces gold; on the ninth the vein is 15 feet wide and contains seams of very high value. A well-known mining engineer claims there are $300,000 in sight in the Modoc.

The six acres of the Gold Sovereign, on Bull hill, is very rich ground, on which there are six sets of lessees, all of whom are shipping ore. The Snyder lease ships thirty tons per day from a vein 18 feet wide, the values from which run $20 to $30 per ton. A new station is being cut 150 feet below the tunnel level. All the lessees are doing well.

The Gold Sovereign Co. has purchased the Rattler, an adjoining property, paying $50,000 in Gold Sovereign stock therefor.

The John A. Logan, whose shaft is 1000 feet deep, has cut several rich leads at this depth, which are supposed to be the same as the Gold Sovereign have opened nearer the surface.

The Copper mountain section of the district is attracting much attention. A number of properties are being developed there, with good results.

On Tenderfoot hill a new hoist is being put up on the property, which has the continuation of the Hoosier vein.

On Lincoln hill the King of Diamonds will soon resume work.

At Rhyolite hill there appears to be a junction of two zones — one from the direction of Copper mountain and the other from Tenderfoot and Carbonate hills. Here is the undeveloped region of the district, where there appears to be a great amount of new work of an exploration nature. A new company has been organized with large working capital, whose base of operations will be in the vicinity of Rhyolite.

During the smelter strike there was a considerable falling off in the production of the district, but since Sept. 1st most of the mines have resumed their normal output, some having increased it, and the district generally is very active. The stock market is active and prices firm.

The Pinnacle mine, on Bull hill, under lease to Whipp & Glenn, recently shipped twelve cars of ore to the smelter which averaged $100 per ton. It is claimed they are producing sixty tons per day.

A careful estimate of production for the month of September of the Cripple Creek district shows that the cyanide and chlorination mills have handled 24,000 tons and the smelters 15,000 tons — 39,000 tons for the month. The mill ores, it is estimated, were distributed about as follows: Colorado-Philadelphia Reduction Co., 8000 tons; Metallic Extraction Co., 9000 tons; El Paso Reduction Works, 3000 tons; National Extraction Co., 2000 tons; Colorado Ore Reduction Co., 2000 tons. A further interesting fact is that the smelting ore now being shipped from the district has an average value of about $100 per ton, and that being milled averages $30 per ton. Just at present the smelters and mills have all they can do on high-grade ores, and as a consequence there is a glut of low-grade ores in the district which were formerly sought with some eagerness. The completion of the Economic Extraction Co.'s cyanide and chlorination plant, soon to be accomplished, will doubtless relieve congested ore channels, as that plant is expected to handle the ores from all the properties in which the Woods Investment Co. are interested, the Gold Coin being the principal one.

The smelters no longer pay the sampler charges, as formerly, hence this expense has to be borne by the producers.

The La Bella Mill, Water & Power Co., at Goldfield, recently made a contract with the Cripple Creek District Railway Co. to furnish electric power for the latter's car lines. The same company is putting in a 300 H. P. motor at the Granite mine, on Battle mountain, for hoisting and other work. Similar motor force will be installed at the Victor, Legal Tender and other mines. This company's compressor plant is furnishing compressed air to operate at least sixty drills in the district. The general management of this company is the same as that of the Florence & Cripple Creek Railroad.

The plant of the Detroit Reduction Co. is about completed, and initiatory tests are being made. The plant cost about $27,000. The method employed is a modification of the panamalgamation process, there being crushers, rolls, cylindrical dryers, pans and settlers, the pulverization reaching from 60 to 200 mesh. They do no roasting. It is said a chemical is to be used to assist amalgamation. F. A. Ryder and O. F. Barnes are actively in charge.

The Moose mine, under the superintendence of Peter Busch, is now operating, but not shipping. Present workings are 800 feet deep and the shaft is being sunk deeper.

At the Elkton a new level is being run at 600 feet depth. This mine is shipping about sixty tons per day. Sol Camp is now Supt., former Supt. W. A. Wilson having gone to Rossland, B. C., to take a similar position on the Le Roi group.

It is claimed the extraordinary flow of water struck in the Standard tunnel, on Beacon hill, has to a large degree drained the mines of Beacon and Raven hills, including several levels on the Elkton.

The Red Umbrella mine, on Raven, under lease to T. Collins & Co., is reported as having made a strike of ore that puts the property in better condition. WASCOTT.

Cripple Creek, Sept. 25th, '99.

(Special Correspondence). — The Economic Extraction works, near Victor, are being built in two sections, one of which is equipped for chlorination and will doubtless be ready to operate within a month. This section will have 300 tons daily capacity. The machinery therein is to be run by nine electric motors; there are seven roasters, with automatic cooling devices; several chlorine barrels, each 17 feet long and 7 feet in diameter; and large tank and settling facilities. Sulphuretted hydrogen will be used in the precipitation process. Refining furnaces are being built to separate the metals from the sulphide materials. Everything will work automatically. The second section, which is to be equipped with cyanide apparatus, probably will not be completed this year.

Victor, Sept. 25th, '99. WASCOTT.

W. A. Otis and C. A. Farnsworth have purchased the entire capitalization and property of the Brigadier G. M. Co., also the property of the Twin Sisters G. M. Co. The latter will be conveyed to the Brigadier. The capitalization will be $1,500,000. The Twin Sisters property is under lease to Vincent & Fitchew, who have opened up good ore at a depth of 45 feet. Returns from the first shipment sent out netted $50 to the ton. In sinking the shaft the lessees are saving ore. The property consists of nine acres east of the Red Umbrella.

The Mitchell claim of the Pinnacle Co. has the continuation of the shoot that has made the Lansing claim of the company famous. The vein encountered in the Mitchell claim was cut at a depth of 20 feet.

The Moon-Anchor mine has struck a flow of 1700 gallons of water a minute in the bottom. The pumps of the mine were equal to 1500 gallons per minute, but, one of the pumps being broken, the water gained. It will not go above the sixth level and the new pumps on the ground will soon lower the water.

The Waldron lease on the St. Thomas on Beacon hill has at 160 feet struck a good streak of ore that will run five ounces of gold to the ton.

Sellars & Co., leasing block 1 of the Mountain Beauty, sent out a 60-ton shipment last week that will run four ounces to the ton.

Cripple Creek August dividends were as follows:

Portland	$80,000
Creston Leasing	12,000
Gold Coin	10,000
Golden Cycle	10,000
Lillie	11,250
Modoc	5,000
Raven	9,750
Strong	25,000
Total	$143,000

IDAHO.

IDAHO COUNTY.

The country about Chamberlain and Thunder mountain is attracting attention. It is reported that there are large heavily mineralized veins in that section and some good assays have been obtained. The ores contain copper, lead, gold and silver.

The Sixteen to One, near Wallace, is employing the largest force of any mine in the Cœur d'Alenes not a shipper. The right of way for the two tramways is cleared. One will be a bucket line carried on wire from the lower tunnel, where the air compressor is being built, to the Custer mill. The other will be a car line from the upper tunnel to the mouth of the lower, for temporary use until connections are made between the tunnels. By the time the tramway is completed the mine will be in shape for a large force, and the property will be one of the heaviest shippers in the district.

J. A. Wilson of Butte, Montana, reports the discovery of rich placers in the Bitter Root mountains, in Eastern Idaho, above Elk City. Mr. Wilson is one of a party of five who made the discovery. Three of the men came out and brought with them $1155. That amount was shoveled into a sluice box in four days by four men. The largest nugget in the cleanup weighed $6.20.

Cuprum *Standard*: A strike was made a few days ago in the Buffalo No. 3 mine. At the depth of 30 feet ore was taken out that will run 60% copper. There were no indications of any importance found until the depth of 15 feet was reached, below which it improved. The Buffalo No. 3 is within a mile of Cuprum.

KOOTENAI COUNTY.

Harrison is a center of mining excitement. There have been 500 locations made in that district during the past two weeks. One hundred men are prospecting the vicinity of Carlin bay. A number of rich strikes are reported near Blue lake, five miles from Harrison. The Hand in Hand, Non-Permit, and Striker, the three claims recently discovered by Wells and Bond, have been formed into a corporation at Wallace, under the name of the Bay View G. & S. M. Co.

OWYHEE COUNTY.

The Black Jack mine at Silver City is reported sold to the Trade Dollar Con. Co.

The Black Jack has been a dividend-payer for years, but was closed some time since on account of a flow of water being met that was too heavy for its plant to handle.

The Trade Dollar company is so situated that it can work the property without going to any outlay for machinery. When the old Trade Dollar and Florida Mountain properties were consolidated, the Black Jack was left between the two groups of claims of the consolidation. The consolidated property is being developed by a long tunnel that will pass under the Black Jack, 300 feet below its deepest workings. This will drain the property and give a large area of stoping ground over the tunnel level. This purchase gives the Trade Dollar 8000 feet on the vein.

SHOSHONE COUNTY.

The Golden Gate Co., eight miles from Pierce, is putting in a sawmill, stamp mill and concentrating plant and hoisting machinery. The Crescent mine, near by, will soon start up. They will have a 5-stamp mill in place. Their ore averages by mill test $38 per ton in free gold. There are other smaller quartz mills working.

The White Elephant claim was discovered this summer in the town of Pierce. A shaft is being sunk. The lead is 30 feet wide between walls and carries sulphide ore.

Spokesman-Review: The output of the Cœur d'Alenes the past week will exceed that of any previous week in the history of mining in the region. The Bunker Hill & Sullivan, Empire State-Idaho, Standard, Mammoth, Helena-Frisco and Hecla are all running with full crews, and, with possibly one exception, taking out more ore than at any previous time. The Morning is producing its average amount of ore, there being 255 men employed in the mine, as many as were ever worked at one time. The Tiger-Poorman is working over 100 men, two-thirds of its full force, and is the only mine working in the camp producing less than the normal amount of ore. The Hecla claims to be turning out more ore to the number of men employed than any other, twenty men sending down four carloads of ore to the Standard mill every other day.

MICHIGAN.

HOUGHTON COUNTY.

Marquette *Mining Journal*: It is stated on authority that the Calumet & Hecla Smelting Works at South Lake Linden are turning out 150,000 pounds of copper daily.

MISSOURI.

JASPER COUNTY.

The Commonwealth Zinc Co. is the latest zinc company to be placed upon the Boston market. The company is capitalized for $500,000. Its properties consist of sixty-eight acres of land in the Joplin Galena district, part of which property has been known as the Rauch & Co. mines. J. C. Houston is president of the company.

MONTANA.

DEER LODGE COUNTY.

It is reported that a new mining region has been discovered at the head of Blackfoot river. The ore carries copper and gold. The claims located are sixteen miles from Cooper lake. The nearest postoffice is Helmville.

SILVER BOW COUNTY.

At the Never Sweat mine men are tearing down the old frame buildings to make room for a new steel gallows frame. An iron frame building is to be erected, to lessen the danger of fire. This building will be occupied by a new 100-drill compressor.

There is a rumor from Anaconda that the Washoe smelter is to be built at once. At Missoula the Washoe Copper Co. has filed articles of incorporation; principal place of business, Butte; capital stock, $5,000,000.

NEVADA.

LINCOLN COUNTY.

The Horse Shoe Co., at Deer Lodge, have made a strike in one of their mines.

STOREY COUNTY.

The unwatering of the Comstock mines through the C. C. shaft proceeds slowly. The latest official telegram is as follows:

VIRGINIA, NEV., Sept. 28, 1899.

TO AUG. WATERMAN, Secretary Comstock Pumping Association, San Francisco: — Stopped No. 2 elevator yesterday morning. Permitted water to raise until 4:30 P. M., when it was 19 feet below the 1950-foot level station. Then started No. 1 elevator and ran it until 7:15 P. M. The water was then 35 feet below the station. Let the water rise again. Ran No. 1 elevator at intervals during the night four hours. Water is now 23 feet 6 inches below the 1950-foot level station. Will commence taking out No. 2 elevator and columns for examination.

JOS. R. RYAN.

NEW MEXICO.

SANTA FE COUNTY.

J. B. Mayo is the managing director of the Old Reliance M. Co., that holds a lease on the Grand Central Nos. 1 and 2, the Broad Gauge Nos. 1 and 2 and the Narrow Gauge Nos. 1 and 2, in the southern part of the Ortiz grant. During the past year Mr. Mayo has profitably treated the low-grade gold ores of these claims at the Graves mill, at Golden, and the company has concluded to put up a 100-stamp mill at the mines. The six claims mentioned are large masses of low-grade ore. One vein is 300 feet wide and 175 feet high.

OREGON.

BAKER COUNTY.

Sumpter *Miner*: The Intermountain mine, twenty-eight miles from Sumpter, has been bought by E. C. Finch of Rossland, B. C., and W. C. Calder of Sumpter, from Schnarr & Hahn. The Intermountain has ore of such high grade as to justify shipments under unfavorable conditions. Finch & Calder will build roads and put in machinery this fall. There is a large quantity of ore on the dump.

Baker City *Republican*: A. J. Harting, F. Teubroeck, E. Gardner, Dr. J. C. Hendryx and C. H. Stuller have made a number of locations on a discovery of copper, gold and silver ore, twenty-five miles from Baker City, on North Powder, and across the divide from the E. & E., Columbia, Golconda, Ibex, Ohio and Cable Cove districts. In the center of the group is an outcrop 300 feet in diameter, and the ore stands 100 feet above the surface. The croppings assay $2.40 in gold, silver $1.60, copper 8⅔%. The ledge has been traced and located for two miles across North Powder river.

Baker City *Republican*: Elmer Cleaver reports that prospectors and miners are at work on nearly every hill and in every gulch in the district beyond Granite. —— Manager Ralph E. Blewett of the Last Loaf mine, owned by the Van Anda Mining Co., says they intend to put in a 20-stamp mill.——In the tunnel on the lower level of the Last Loaf claim, 200 feet in the hill, they are in ore 10 feet and not yet through it.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Deadwood *Independent*: Two men on the Otto Grantz property, on the divide between Gold Run and Poormans gulch, took out $10,000 in one day last week.

UTAH.

BEAVER COUNTY.

A report from the Homestake mine, in the Mount Baldy mining district, near Marysvale, says that a vein of ore has been found, at a depth of 60 feet, that carries $40 gold and sixty ounces silver per ton.

GRAND COUNTY.

J. B. Skewes, of the Big Indian group, says

work is being concentrated on the shaft which is to go a depth of 500 feet, or greater. It is now down 60 feet, with six men employed. A steam plant will be put in as soon as depth requires.

JUAB COUNTY.

Salt Lake *Tribune*: M. Kopp, manager for the International M. Co., in West Tintic, reports the mines improving. It is reported that in the Silver Summit a strike has been made and shipments will commence.——J. Hupper, Supt. Blue Bird at Diamond, reports that ore has been encountered, cutting the station on the 325-foot level, that was identical with the high-grade ores in the Joe Bowers and Showers Con., adjoining the Blue Bird.

SALT LAKE COUNTY.

W. Hatfield has acquired control of the Sunrise group of a dozen claims in Carr Fork, Bingham district, for $46,000. Associated with him are J. Dederich and J. R. Middlemiss. Shafts have been sunk and tunnels driven in prospecting the ground. Recently the owners uncovered a body of ore that carries high-grade copper.

The Highland Boy smelter has shipped 300,000 pounds of gold and silver bullion to the Perth Amboy, N. J., refinery.

SUMMIT COUNTY.

Park *Record*: At the Massachusetts during the week a vein of ore has been uncovered in the winze being sunk from the 300 level.—— The Crescent Co. is shipping 1000 tons of sulphides from their concentrator. There are 4000 tons altogether.——Work is progressing on the pipe line between the Alliance and Silver King; by Oct. 1st there will be abundance of water at the Silver King, and the mill will be running regular shifts and turning out 200 tons of concentrates daily.

TOOELE COUNTY.

It is reported at Stockton that the Galena King will put in a steam jigging plant for the purpose of concentrating low-grade galena. At present the mine is shipping high-grade ore.

The consolidation of the Annapolis and Golden Seals companies at Mercur has just been made, and in future will be under the control of the Annapolis Con. Co. This gives the Consolidated sixty acres of ground on the gold-bearing zone, and a new shaft on Annapolis territory will begin under the direction of F. J. Leonard.

WASHINGTON.

FERRY COUNTY.

In the Surprise, of the Lone Pine Con. Co., they have opened a 4-foot body of ore which sampled $500 per ton. For the past ten days the values on this drift have run from $30 to $150 per ton. The ledge is widening. In No. 2 tunnel of the same mine another ledge has been struck, the width and values of which have not been determined. This is 300 ft. south of the point where the rich ore was encountered.——On the Hill Side claim, at Republic, the ledge has been stripped 40 to 60 feet in width. Manager H. L. Percy believes that when opened it will be the largest body of ore in the camp. It is low grade as far as opened. A shaft is to be started.——In the Insurgent there is said to be 8 feet of ore in the crosscut. The Lone Pine Co. is extending its drift from the Insurgent shaft into the Last Chance ground.

Spokesman-Review: At the Jim Blaine, in Republic camp, the drift on the third level of the Republic mine is being extended into it, which will open the property at a depth of 380 feet. Arrangements have been made for working the mine through the Republic workings.——There are 85 men on the payroll of the Mountain Lion; this number will be increased to 100. The winze from the drift at the 320 level is down 50 feet, and values are higher in the bottom than in the drift, according to Supt. Wyatt. The shaft is being sunk 5 feet a day. Machinery for the mill is at Northport and at Grand Forks.

OKANOGAN COUNTY.

The Roanoke, twelve miles north of Loomis, has made a strike in a tunnel on the vein, the tunnel now being 500 feet in.

WYOMING.

CARBON COUNTY.

A. McKinnie of Rawlins reports that he has sold to California capitalists the Seminole gold mines, thirty miles north of Rawlins, for $82,500. They were formerly owned in New York. The property includes five patented claims and they have been opened by 2500 feet of tunneling.

LARAMIE COUNTY.

Laramie *Boomerang*: E. Hofman of Cheyenne has found on his ranch on the Sybille, thirty miles west of Wheatland, rich samples of copper ore. This prospect was opened twenty years ago. Hofman brothers will reopen the workings, which have caved, and put in machinery.

FOREIGN.

AUSTRALIA.

Wood & Co. at Maryborough have opened up the first reef intersected by the tunnel and thirty tons raised, from which they picked out thirty-two ounces of specimens, and the nine tons eighteen hundredweight treated yielded an additional one and one-half ounces to the ton.

The Kalgoorlie mines in Western Australia produced in July 60,032 ounces gold.

BRITISH COLUMBIA.

The Le Roi mine at Rossland is to work ninety machine drills, having ordered another 40-drill compressor.

C. P. R. graders have cut another large ore body on the Oro Donoro, in Summit camp, 250 feet north of where they had previously opened up a large body of shipping ore. R. Thompson, vice-president of the company, has a large force quarrying out the ore where the railway first cut it. The property will soon be in a position to ship 100 tons of ore daily. The main shaft is down 185 feet.

Men set to work to strip the Kitty W., on Pathfinder mountain, struck clean ore at a depth of 2 feet. The cropping is reported 350 feet wide.

L. H. Webber, Mgr. of the B. C. Bullion Extracting Works, the custom cyaniding mill at Rossland, says that if his company can get the tonnage they will increase the capacity of the plant to 200 tons.

Personal.

A. C. MIZNER has returned to San Francisco from the Klondike.

A. W. KINNEY, of Los Angeles, Cal., is located at Cripple Creek, Colo.

JOSEPH PORTER is Supt. of the Altoona quicksilver mine, at Cinnabar, Cal.

A. B. W. HODGES is superintendent of the Granby smelter, Grand Forks, B. C.

C. L. LANG, late of Sonora, Cal., is Asst. Supt. Gold Belt M. Co., Doniphan, Idaho.

C. C. DERBY, superintendent of the New Almaden, Cal., mine, is visiting San Francisco.

C. N. CROWDER is now superintendent of the Doctor mine, Cripple Creek district, Colo.

W. E. JOHNSON recently returned to Denver, Colo., from an extensive trip through the East.

D. JUTTON of San Francisco is in Nevada county, Cal., examining mines for San Francisco parties.

T. CLARK left Placerville, Cal., this week for Colombia, S. A., to superintend the Playa De Oro mine.

H. A. COHEN has gone from Salt Lake City to Inyo Co., Cal., to examine property for J. R. De Lamar.

J. W. NEILL, of Salt Lake City, Utah, is in Boston, in connection with Bingham, Utah, developments.

J. F. COLEMAN, developing the Mammoth copper mines at Kennett, Cal., left for New York City this week.

H. A. CLAPP, of Rex Investment Co., Cripple Creek, Colo., is in Sonora, Mexico, engaged in some mine development.

W. H. LEFFINGWELL, M. E., of Cripple Creek, Colo., has been sojourning the past few months in California.

A. EKMAN, in charge of the mining department, California Paris Exposition, made an official visit this week to Shasta county, Cal.

W. J. O'DONNELL, of Shasta, Cal., is field deputy of the Cal. Paris Exposition Commission for collection of ores of Shasta, Siskiyou and Humboldt counties.

S. F. EMMONS, department of economics, U. S. Geological Survey, has returned to Washington, D. C., from an extended observation through Montana, Utah and Colorado.

H. H. HUNTER, who negotiated the transfer of the Afterthought copper mine, near Redding, Cal., is in San Francisco, to complete the sale of the property. Salt Lake and Butte capitalists are the purchasers.

R. E. BROWN, the American mining engineer, who obtained judgment for $5,000,000 against the Transvaal Republic, fears that the present imbroglio with England may interfere with the ultimate collection of his claim.

J. A. FERSON, of Madera, is Supt. of the mines of the California Copper Co. at Dalton, Madera Co., Cal. H. B. Nicholls of the Selby Smelting works will be Supt. at the smelter. F. F. Sharpless is general manager, with office headquarters at Madera, Cal.

J. H. MEANS, who has been a field assistant to the State Mineralogist of California for several years and who is a graduate of the University of Indiana, has accepted a position in the interior of China, with Moring & Co. of London, large mining operators, at a salary of $4000 and expenses. Mr. Means joins H. C. Hoover, also formerly of San Francisco, who has been in China for some time past. He left Friday on the steamer Coptic for the Orient.

PROF. L. L. DYCHE of the University of Kansas is in San Francisco, Cal. He has been making a study of the large living mammals of the Pacific coast and has recently given particular attention to the seals and sea lions. During the week he has delivered two lectures under the auspices of the Academy of Sciences, one on Monday evening on "Danish Greenland," and on Wednesday night on "The Arctic Highlands and the Problem of the Pole."

Recently Declared Mining Dividends.

Montana Copper Co., 18%; Sept. 25.
Mercur, Utah, $50,000; payable Oct. 20.
Boston-Duenweg Zinc Co., 1%; Sept. 25.
New York Zinc Co., 1%; payable Oct. 2.
Boston-Providence Zinc Co., one-half of 1%; payable Oct. 2.
Gold Coin Mining & Leasing Co., Victor, Colo., $10,000; Sept. 25.
Raven G. M. Co., Cripple Creek, Colo., $10,000; payable Oct. 20.
Cloverdale Zinc M. Co., Joplin, Mo., quarterly 2%; payable Oct. 10.
Pennsylvania M. Co., Grass Valley, Cal., 23rd, 20 cents per share; Sept. 25.
Anaconda M. Co., Butte, Mont., $1.25 per share and 75 cents per share extra; payable now.
Amalgamated Copper Co., first dividend $1.50 per share, 50 cents per share extra; payable Oct. 16.
Mountain Copper Co., Shasta Co., Cal., $540,000; Sept. 30.
Giant Con. Powder Co., 50c per share; payable Oct. 10.
Boston & Colorado Smelting Co., quarterly dividend of 1¼%; payable Oct. 2.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPTEMBER 19, 1899.

633,409.—BICYCLE DRIVING GEAR—W. H. Abercrombie, Tacoma, Wash.
633,227.—HAT HOOK—W. S. Bractie, Oakland, Cal.
633,420.—SAW GAUGE—J. Brown, Rockwood, Ogn.
633,984.—WATER WHEEL—W. A. Doble, S. F.
633,285.—CAR AND TURN TABLE—G. A. and R. F. Dunn, Dinuba, Cal.
633,440.—DRAFT APPLIANCE—G. N. Farnsworth, Grimes, Cal.
633,548.—SCORING TOOL—O. C. Fenlason, Hoquium, Cal.
633,441.—OIL CAN—W. E. Forest, Los Angeles, Cal.
633,263.—SURVEYOR'S INSTRUMENT—D. Grant, Petaluma, Cal.
633,264.—INVALID'S BED—G. Huntington, Santa Ana, Cal.
633,267.—CULTIVATOR—Jensen & Rowe, Watsonville, Cal.
633,382.—EYE GLASS FRAME—H. L. King, Spokane, Wash.
633,461.—DOOR SECURER—O. Kure, Chehalis, Wash.
633,247.—LEMON SQUEEZER—E. D. Middlekauff, S. F.
633,530.—HOP BIN—L. M. Meyers, Newberg, Ogn.
633,290.—SLIDING DOOR—A. Newell, Pasadena, Cal.
633,291.—SLIDING DOOR—A. Newell, Pasadena, Cal.
633,292.—TOBACCO PIPE—I. Nicholson, Vallejo, Cal.
633,474.—ROTARY PUMP—R. J. Northam, Los Angeles, Cal.
633,475.—ROTARY PUMP—R. J. Northam, Los Angeles, Cal.
633,476.—ROTARY PUMP—R. J. Northam, Los Angeles, Cal.
633,477.—ROTARY PUMP—R. J. Northam, Los Angeles, Cal.
633,478.—ELECTRIC MOTOR—Northam & Nolan, Los Angeles, Cal.
633,248.—ROLLER CRUSHER—A. J. Petter, Randsburg, Cal.
633,153.—MATCHER HEAD—W. W. Philbrick, Seattle, Wash.
633,154.—MATCHER HEAD—W. W. Philbrick, Seattle, Wash.
633,489.—SHARPENING FILES—J. F. Revalt, S. F.
633,493.—REIN HOLDER—J. G. Ryckman, Knappa, Ogn.
633,537.—LEAK STOPPER—S. M. Stewart, Escondido, Cal.
633,254.—CONCENTRATOR—F. W. Wood, Los Angeles, Cal.
31,515.—DESIGN, BADGE—W. S. Tarrant, Seattle, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STAMP AND ROLLER CRUSHER AND PULVERIZER.—A. J. Petter, Randsburg, Cal. No. 633,248. Dated Sept. 19, 1899. This invention relates to an apparatus for crushing and pulverizing ores. It consists of a circular mortar having an annular die fixed therein, stamps, the stems of which are guided in a frame which is rotatable about a central shaft. Rollers are journaled upon the revoluble frame between the stamps having faces adapted to travel upon the dies. A mechanism is carried upon the revolving frame including horizontal shafts and gears and cams on the shafts so that the stamps are raised and allowed to fall while the apparatus is revolving, the rollers following the stamps and adding their crushing effect. Suitable screens are arranged around the periphery of the mortar for the discharge of the pulp when it has been sufficiently reduced and the rollers are carried upon the lower ends of spring-pressed standards by which any pressure upon the rolling faces may be produced.

CAR AND PORTABLE TURNTABLE.—George A. Dunn and R. F. Dunn, Dinuba, Cal. No. 633,235. Dated Sept. 19, 1899. This invention is designed for use in handling fruit or other goods which are to be moved from place to place, and comprises a car having two frames, the lower one mounted upon bearing wheels which travel upon a track, and the upper portion has a mechanism by which it may be raised or depressed, and a turntable attached thereto and carried thereby, with mechanism by which it may be raised from the surface when the upper portion of the car is raised, the car then traveling in any desired direction upon its rollers. When it arrives at a point where it is to be turned to travel at right angles, or in some other direction, the turntable is pressed down at the center of the meeting tracks, and the whole of the lower part of the frame and wheels are lifted from the surface and can then be swiveled around upon this portable turntable until the car stands in line with the new direction in which it is to travel. The wheeled frame is then lowered upon the tracks and the turntable being lifted clear of the surface, the car is ready to travel in its new direction.

Books Received.

"*Architect's Hand-Book on Cements*," A. H. Clarke; 12 mo., 96 pages. Devoted to a classification of cements used in building, with directions for mixing and using them. Useful to builders. Published by W. M. Clarke & Son, Baltimore, Md.; $1.

"California Mines and Minerals; published by the California Miners' Association under the direction of Edward H. Benjamin, secretary, for the California meeting of the American Institute of Mining Engineers, San Francisco, Cal., 1899," is the title of an unusually handsome quarto of 500 pages, a souvenir compilation commemorative of the first meeting west of the Sierras of the American Institute of Mining Engineers. Where merit is so manifest praise is superfluous. In style and execution the work is worthy of the event that called it forth, and is of unusual value. It is a good advertisement of a State that doesn't get advertising enough; it gives facts and figures; it has able articles by practical men; it is finely put together, treats technically of all kinds of gold mining in all parts of the State, discourses on the development of other forms of mineral wealth, discusses new and improved appliances and furnishes considerable up-to-date information. The names of the contributors are a guarantee of merit in the various articles, and the typographical excellence of the work adds to its general value. No man can read this book without an increase of knowledge concerning the mineral resources of California, and an increased respect for the State which has contributed so largely to the permanent wealth of the world.

Industrial Notes.

—A further advance is reported in iron and steel.

—Salt Lake City, Utah, has a daily smelter output of 800 tons.

—There are 100 artesian wells in the town of Roswell, New Mexico.

—Interest charges, even in the South, are being reduced to 3% per annum.

—Northwestern counties are refunding their bonded indebtedness at 4% and 5%.

—News from Johannesburg, South Africa, reports a partial cessation of the Rand mining industry.

—The Southern Pacific is going to build a cut-off from Wells, Nevada, to Salt Lake City, Utah, 180 miles in length.

—The San Francisco boiler makers are quarrelling over good wages and have concluded to strike. Rival ports do not object.

—It is now expected that the "Valley road," giving San Francisco a second transcontinental line, will be finished and in operation by Februrary 1st, 1900.

—Santa Rosalia, Lower California, reports a scarcity of men at the mines and smelters of the Boleo Co. About 250 went to the fabled placer fields near San Roque.

—The Burlington railroad is erecting a tie-preserving plant at Edgemont, S. D., to cost about $40,000 and to be completed about Oct. 1st: 3000 ties a day will be treated.

—The Philippine troubles have created an immense emergency business at San Francisco, resulting in an increase in prices of all manner of supplies throughout California.

—The Southern Pacific Co. has again abrogated class tariffs and put into effect its former freight schedule, which is a raise of about 30%. The new rule begins October 10th.

Commercial Paragraphs.

TRUAX ORE CARS have recently been shipped from the Denver, Colo., shops to Honolulu, Hawaii, and Joplin, Mo.

THE Sullivan Machinery Co. have started a diamond drill at work in Breckenridge, Colo., district for prospecting purposes.

MCFARLANE & Co. of Denver, Colo., shipped a car of crushing machinery on the 20th inst. to Pueblo for the Philadelphia Smelting & Refining Co.

M. E. HOPKINS and associates have opened a machine shop at Cripple Creek, Colo., under the corporate name of Cripple Creek District Machine Works Co.

MR. ROY D. HUNTER, Western Mgr. Sullivan Machinery Co., Denver, Colo., reports the installation of fifteen 3-inch Sullivan drills at Capt. DeLamar's mine at Mercur, Utah.

THE Silver King mill, Utah, is arranging to use Frue vanners for the finer slimes, five 6-foot Frue vanners having been ordered from Fraser & Chalmers after a satisfactory test of the 6-foot Frue.

THE pneumatic cyanide process has been adopted at a new cyanide mill, recently put in on the Colorado group, in Royal mining district, Mineral county, Colo. The property belongs to R. Darling and H. E. Lang.

FOR the convenience of their customers, Fraser & Chalmers have established sales offices at 1426 to 1429 Marquette Building, Adams and Dearborn Sts., Chicago. Their main offices will be located at their new works, Twelfth St. and Washtenaw Ave. All letters and communications for them should be addressed Fraser & Chalmers, Twelfth St. and Washtenaw Ave., Chicago.

THE new third edition of the catalogue of the Electrical Engineer Institute of Correspondence Instruction of New York shows the interest which all classes of workers are taking in this new educational departure. A strong feature of the Institute's work lies in the fact that all its instruction papers have been prepared by eminent specialists and authorities in their respective fields. In the new catalogue is a complete synopsis in detail of every topic in every course which the Institute teaches. In the new edition are many letters from students of the Institute, both at home and abroad, who express great satisfaction at the benefits that the studies have conferred upon them. The Institute is reported to be meeting with remarkable success, due to the high standard which it has taken in the preparation of its instruction papers and the conscientious manner in which it deals with its students. Mr. Joseph Wetzler, M. E., E. E., is the president of the Institute and Mr. T. C. Martin, editor of the *Electrical World and Engineer*, is vice-president. Both these gentlemen are well and favorably known in the electrical engineering profession. The Institute's catalogue will be sent free to any one on application by addressing the main office, 120-122 Liberty St., New York.

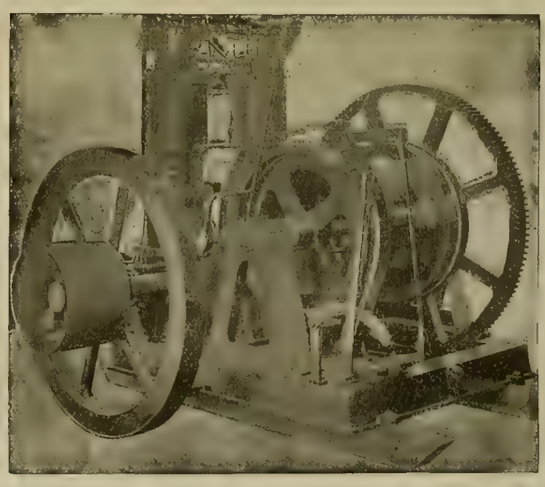
WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.



Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MACHINERY—ALL KINDS

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.
If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can dlace any other instrument. Send for descriptive catalogue B to

No. 044 BUTTON BALANCE. Sensibitity 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

WM. AINSWORTH & SONS,
(Successors to WM. AINSWORTH.)
DENVER, COLO., U. S. A.

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

32 FIRST STREET, SAN FRANCISCO, CAL.

NO MORE PACKING DIRT TO WATER.

—THE—

PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

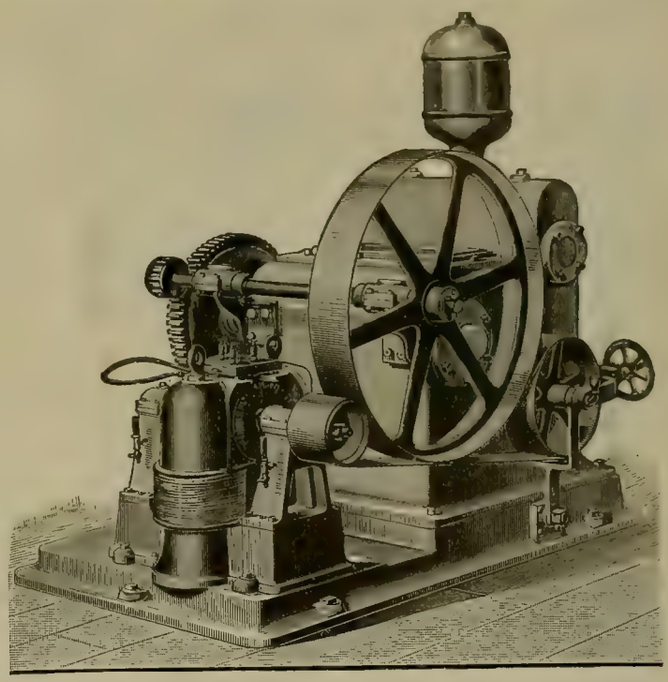
THE



"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

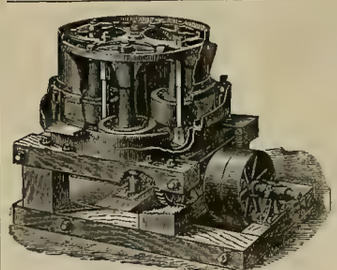
DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.



"The Proof of the Pudding is in the Eating."

Something over a year ago, two of these Richards' Patent Triple Plunger Pumps, with motors as shown, were supplied to a mine in Mexico, for the purpose of raising water to an elevation of 650 feet. The owners were so well pleased, that they ordered another of the same a few months later. These pumps were arranged with outside packed plungers, for pumping muddy water — designed for that purpose, they did it satisfactorily.

For all purposes where a uniform resistance to the driving motor is a consideration, these pumps are admirably adapted. Triple Plungers and crank shafts run in a bath of oil if desired. Made with large valve areas, and by actual test develop a very high efficiency. Furnished with or without motors, or for use with gas or steam engine.

This is only one of over fifty different kinds of pumps we make.
Our 1899 Catalogue tells all about them; sent on application.

Market Reports.

SAN FRANCISCO, Sept. 28, 1899.

SILVER.—London, 27d; New York, 58⅛; San Francisco, 58⅛@58⅝; Mexican Dollars, 47¾@48⅜; New York exchange, sight, 12½; telegraphic, 15 cents premium.

Director of the Mint Roberts is quoted as saying that there is no bullion out of which to make fractional silver except some uncurrent coins, which are being recoined. There is less than $1,000,000 of these coins in the treasury, and $2,000,000 have been used up in the last two weeks.

LEAD.—New York reports quiet, $4.62½ bid, $4.67½ asked; brokers' price, $4.40. Local, pipe, 7¼@7¼c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6¼c.

COPPER.—New York reports Lake very quiet at $18.50; brokers' price, $18.37½@18.50. Local—Mill copper plates, 23½c.

Copper this week is showing a faint sign of weakness in the brokers' price, which is $18.37½@18.50, where heretofore it has firmly remained at $18.50. Some large dealers predict for the year 1900 steady market at 15 cents per pound.

IRON.—American, soft, $23.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

The production of pig iron in the United States for the year ending June 30, 1880, was 3,835,191 tons; in 1885 it was 4,044,526; in 1890 it reached 9,202,703, and in 1895, 9,446,308. It is estimated that in 1899 it will reach 14,000,000 tons. The following is Mr. Jeans' estimate of the pig iron production of the principal iron-making countries of the world for 1899:

	1899. Tons.
United States	14,000,000
Germany	8,250,000
United Kingdom	9,500,000
France	2,700,000
Belgium	1,200,000
Sweden	550,000
Austria	950,000
Total	37,150,000

STEEL.—11¼@20c per pound.

TIN.—Weak, $31.75 bid, $32.15 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $46; export, $40.50@41; carload lots, special rates.

The local market is firm, but no change in price during the week.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15¼c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c ₱ lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5½@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2¼c; California refined, 1¼@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

CANDLES.—Electric Light Candles—6s, 16 oz., 8½c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5¾c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7¼c; 6s, 10 oz., 6¾c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.20; less than 200 gals., $1.25; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 56c; cs., 66c; raw, bbl., 54c; cs., 59c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 19c; Astral, 19c; Star, 19c; Eocene, 21c; Extra Star, 23c; Elaine, 24c; Water White, bulk, in tanks, 13c; Mineral Seal, iron bbls., 21c; wooden bbls., 23¼c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of September, 1899, an assessment (No. 20) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of October, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES ROVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.— Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1899, an assessment (No. 1) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of October, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of September, 1899, an assessment (No. 14) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of October, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 8) levied on the 9th day of August, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.

J. H. Pein	200	500	50 00

And in accordance with law, and an order from the Board of Directors, made on the 9th day of August, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 773 Mission St., San Francisco, California, on WEDNESDAY, the 11th day of October, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California. Office hours from 1 to 3 P. M.

DELINQUENT SALE NOTICE.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill Divide, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 20) levied on the 10th day of August, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

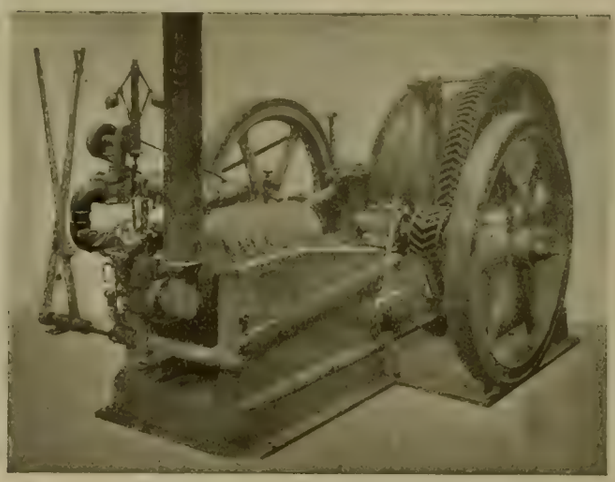
Name.	No. Cert.	No. Shares.	Amt.
Guy C. Earl	73	800	$4 00
Guy C. Earl	161	320	1 60
D. M. Kent, Trustee	273	1,867	9 33½
Mrs. Elizabeth Weaver	315	500	2 50

And in accordance with law, and an order from the Board of Directors, made on the 12th day of September, 1899, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, No. 1209 Claus Spreckels building, San Francisco, California, on SATURDAY, the 7th day of October 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. J. CRAWFORD, Secretary.

Office—1209 Claus Spreckels building, San Francisco, California.

STOCKHOLDERS' MEETING.



Notice of Stockholders' Meeting of the Oneida Gold Mining & Milling Company.

In accordance with a resolution passed by the Board of Directors of the Oneida Gold Mining & Milling Company, a meeting of the Stockholders of this company will be held at 2 o'clock in the afternoon on TUESDAY, the 24th day of October, 1899, at its principal office, Room 24, No. 320 Sansome St., San Francisco, California, to consider and vote upon a proposition to increase the capital stock of this company to Two Million Dollars in Four Hundred Thousand Shares at the par value of Five Dollars each. JOSEPH H. MOOSER, Secretary.

Dated San Francisco, Cal., Sept. 8, 1899.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogues Nos. 15 and 16.

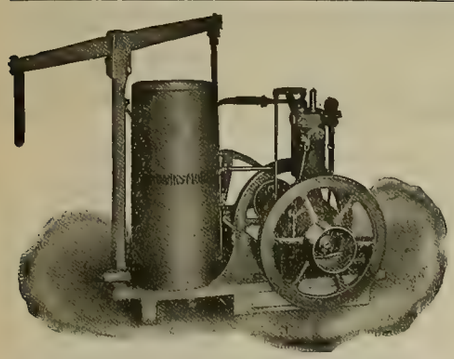
—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY



For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages.
SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

Cableways, Incline Planes,
Double Rope Tramways, Logging Machinery,
Wire Rope Transmissions, Suspension Bridges,

DESIGNED, FURNISHED, ERECTED. Write for Estimates.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

"JACK OF ALL TRADES" is provided with Walking Beam (with 5, 8 or 10-inch stroke), Belt Pulley, Torch Igniter, Electric Igniter, Battery and Cooling Tank. Can be lifted by four men.

FAIRBANKS-MORSE

"JACK OF ALL TRADES."

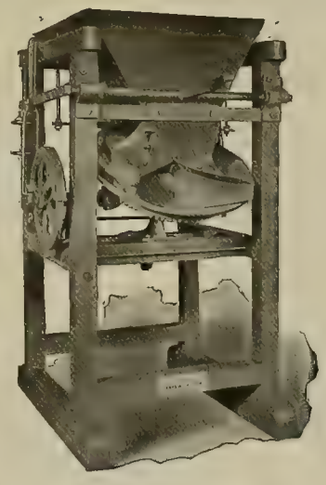
A complete Engine of 1½ Horse Power, which will give excellent results with either gasoline or distillate. Powerful, compact and easily handled. Can be useful on every mine.

SEND FOR SPECIAL CATALOGUE.

FAIRBANKS-MORSE GASOLINE ENGINES.
ALL SIZES UP TO AND INCLUDING 54 HORSE POWER.

FAIRBANKS, MORSE & CO.,

310 Market Street, SAN FRANCISCO, CAL.
201 N. Los Angeles St., LOS ANGELES, CAL.



CORRESPONDENCE SOLICITED.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Licensee for the Manufacture and Sale, **PARKE & LACY CO.,** 21 & 23 FREMONT STREET, San Francisco, Cal.

AGENT FOR

KNOWLES PUMPS and PULSOMETER PUMPS,
INGERSOLL-SERGEANT ROCK DRILLS and AIR COMPRESSORS.

Scenes in Lower California.

Until comparatively recent years Lower California has been a terra incognita, but within the past decade the country has been more thoroughly explored than ever before and it is now known to possess many and valuable undeveloped resources. Among these the most prominent or, at any rate, the most quickly and easily available, are its mineral deposits. One of the most important mining concerns operating in Lower California is the Ybarra Gold M. Co. of Calmalli, and San Francisco, Cal., which owns and operates some of the richest mines on the peninsula. Their mines are at Calmalli near the gulf coast. There are numerous claims, of which that having the greatest development is the Otilia. This has two shafts—one vertical, the other inclined—the former 400 feet deep, the latter 600 feet. They are 500 feet apart. The underground workings have a lateral extent of about two miles. The property is equipped with a 20-stamp mill and concentrators. Steam power is employed. The veins occur in slate. The mineral belt is from one and a half to two miles wide and has a length of about fifteen miles. From 200 to 300 men are employed. On this page are views of the shafts and mill of the Ybarra Company. These well appointed works form a striking contrast with the old Mexican arrastra. Near the head of what is known as the Hardy-Colorado river in the Copaca region not far below the international boundary, are some remarkable mud geysers. There are about sixty of these vents to the subterranean forces, covering several acres of land. They are of spasmodic action—remaining quiet for a time, when a series of explosions signal an approaching eruption, and mud, water and steam are ejected several feet into the air. The illustration of the mud volcanoes gives a very good idea of their appearance. The crater of the Sierra Prieta is that of an extinct volcano in the northern portion of Lower California. Near the crater and geysers are lakes of inky water. The color is due to fine sediment in suspension. The illustrations are from J. R. Southworth's "Baja California Illustrado."

Patents for Pacific Coast Inventors; Notices of Recent Patents; Catalogues Received; Obituary; Recently Declared California Dividends; Rock Drilling Contest, 411-412.

THE Minister of Mines for New South Wales, Australia, has had a law passed that no inexperienced person shall be allowed to work in the face of a coal or other mine unless accompanied by some person who has had at least two years' experience as a miner. This appears like a sensible law, for, even though an inexperienced man may escape injury himself, his timber work may be defective and subsequently result in the death or injury of others. All miners have to learn their business, and new men and boys must be employed in mines; but it is not proper to place these inexperienced men and boys in positions of responsibility, where others may suffer from their lack of knowledge.

A MINING BUREAU has been opened in Jerome, Ariz., in which has been placed a fine collection of ores and relics found in the ruins and mines of prehistoric Arizona. Besides these the bureau is prepared to furnish information relative to the resources of Yavapai county and of the Territory. This is an excellent thing and is in line with a suggestion made by the MINING AND SCIENTIFIC PRESS some months ago. The county officials of each county should take up this matter and provide a suitable apartment for a display of the county's minerals and other resources, accessible at all times to the public. With such a collection at the county seat, in event of an exposition at some important point the county would be prepared to send for exhibition the best that its mineral resources would afford, at little expense and without delay. Such a step could not fail to benefit the section making the display. Jerome's example is worthy of emulation.

WITHIN the past six months the price of iron and steel has doubled. Such a condition never before confronted the industrial world and the question everyone interested is asking is, How much longer will it continue and to what price will iron go? The mining industry is particularly affected, as the machinery employed in and about mines, reduction works and mills is all ponderous and heavy, consuming a large amount of raw material. Under the impetus of a rising market the great iron mines of the Lakes region, and those in the Southern States and elsewhere, have been urged to extraordinary effort and their output has been very large, but not sufficient to meet the demand. In a few weeks more the Lakes will be closed and transportation will stop, but the demand for machinery and structural iron is not likely to cease at the same time. To add to the uncertainty of the future of the iron business there is no surplus of any considerable amount on hand. In 1897 there were stocks on hand amounting to 1,000,000 tons of pig iron. In the past month this had decreased until but 160,000 tons remained. This shortage of iron and inability of manufacturers and founders to promptly fill orders is affecting the mining industry more than the high price of iron, for there are comparatively few orders withheld on account of the latter condition.

Timbering at the Utica Mine, Cal.

During the recent session of the American Institute of Mining Engineers in San Francisco, Cal., a paper was presented entitled "Deep Mining at the Utica, Angels, Cal.," by J. H. Collier, a student of the University of California. It is reproduced on pages 404, 405 and 406 verbatim. Mr. Collier had the advantage of two years' practical experience in the Utica mine and describes in detail some of the practice of that mine.

The paper is well written and is a credit to its author's observation and industry. There are, however, several points which deserve comment. Passing those paragraphs descriptive of the geology of the mine, as expressing the opinions of an individual, with which others may or may not agree, the practical working of the mine is reached, and the methods of stoping and timbering are described.

The method of placing shaft timbers with the narrow face upward offers no advantage, as the compressive strains coming from the sides would be better resisted by placing the plates with the wider side upward. Moreover, the manner of framing offers no resistance to the crowding in of posts by pressure from the surrounding rock masses. The ends of the posts rest flush on the end pieces, top and bottom, according to the description and drawing. This method saves time in framing and also in putting the posts in their places in the mine, but for the reason stated the practice does not appear advisable.

In the stopes when a level is started the posts of the first floor sets are stood up on the solid rock, with 6 inch spreaders and 12-inch round sprags between the posts at the bottom. Over the spreaders a floor is laid.

In dispensing with sills the stoping up and connecting of levels can only be accomplished with difficulty. The author of the paper says: "Sills are not, as is generally supposed, an advantage in working up under an old stope."

The illustrations accompanying the articles indicate sills beneath the first floor sets, but they are only the length of a single set. Sills of such length are wholly unsuited to the purpose for which they are intended. All sills should be at least two sets in length and those having the length of three sets are much more satisfactory. Sills of the latter dimensions will afford abundant support to the filling of the stope above, if covered with a floor of lagging, and would prove in every respect superior to a floor of planks laid upon spreaders. Moreover, long sills do not subside from beneath the foot of the posts as described in the paper, though short sills may do so.

In the sets a 2-inch space (and sometimes a larger one) is left between the ends of the caps, the idea evidently being that there should be a certain amount of flexibility or "give" to the timber sets. It is the practice or the intention to insert a 2-inch block or another of suitable size between the ends of the caps to fill this space, but it is not always done. In a stope 100 feet wide sustained by twelve sets, each 8 feet, a subsidence of 2 inches on each set, making no allowance for the crushing of the timbers, would admit of a movement of fully 2 feet on the hanging wall side. To this add the compression of the timbers by the weight of the ground and the result may be surmised, and that is what occurs; large rents and gaps are found on the hanging wall side of the mine, being always an element of extreme danger.

The principles of mine timbering are to render the entire structure as rigid as possible and permit no subsidence to occur, for, as a rule, when the superincumbent weight has started no timber can hold it. Filling is now extensively practiced in the Utica with beneficial effect. In its early history it was neglected and disaster resulted.

The caps are only framed on one side, making it necessary for the men to cut and fit timbers underground by the light of the sickly glow of small oil lamps attached to each man's hat. That this is less expensive than framing on the surface with gang saws, there is reason to doubt. Men cannot work in the dark stopes of a mine with ax and saw as cheaply as the same work can be done on the surface, even if the same tools are employed; nor is the element of time required to put the timbers in place to be overlooked. In any modification of the square-set system, the previous framing of all timbers on the surface, so that each individual member shall be interchangeable for another of its kind, affords the best results. The timbers used at the Utica are all round, except in the shaft, and of course these timbers are not uniform in length (though nearly so, and might easily be made so), nor are they of uniform thickness. This is given as a reason why so rude a system is employed. In the Wildman mine, at Sutter Creek, in Amador Co., Cal., round timbers are also employed with the same disadvantages as to inequalities in size as those at the Utica; but a system of framing is in use which dispenses, to a great extent, with the necessity of framing underground.

At the Wildman the posts are framed with tenons 6x12 inches, which on top of the post are 8½ inches long, and on the bottom 3½ inches long. The posts rest upon each other (after the Nevada system designed for top pressure), the caps being framed with a tenon 12x12 inches, which is 4 inches long. These tenons rest upon the shoulders of the posts. Double sprags are also employed, so placed as to abut against both upper and lower post at their intersection. The right-hand sprag binds the cap on the right and the left-hand sprag that on the left.

Mr. Collier says: "The system seems to have all the merits of the square-set system used on the Comstock, at the same time being cheaper and more flexible. It is cheaper because the cheaper round timber is used and the framing is much more simple. Much of the framing is done in the mine, while waiting for the partially framed timber to come from the surface."

The logic of the above argument is not apparent, for the reasons already stated, and if the delay caused by the failure to promptly deliver timber is the only excuse for its use it would seem that it is a difficulty which might easily be overcome.

On the whole, the system of timbering at the Utica mine appears to be unnecessarily cumbersome, rudely built and placed in position under greater disadvantage and at the expense of more time than should be necessary.

"Theory" and "Theorists."

The time has gone by when the term "theorist," or a sneer as to "theory," conveys much influence. Theory is now recognized as a necessity, a force, a vital influence. Fanciful beliefs, false assumptions, idle notions, fads and chimeras have no part in real theory, for a theory is as susceptible of being real as any tangible result. There is nothing done of merit or value that did not begin as a "theory." Without "theory" there would be no practice. Certain definite views of the way in which a thing is to be done, the "how" of it, is the theory; following out this "how" is the practice; theory is the foundation, practice the structure. Before one does anything worth doing he must have a definite plan; the theory is the generalization from known facts, the application of knowledge, observation and experience. A man knows something; he theorizes thereon or therefrom. If such theory be sound, success attends its practical application. The successful demonstration of a theory makes it a known truth. Those who are too ready to ridicule "theories" forget that nearly everything we know was once only a "theory;" when the "theory" was demonstrated it became a fact. Theory is the force that directs and precedes all action. Time was when it was a "theory" that the earth was round; there were "theorists" who thought that air was resolvable into elements; other "theorists" believed that electricity could be generated and the current interrupted, producing light and power; "theory" predicated the locomotive, the telescope, the battleship, the automobile. There are theories and theories; demonstrable theories mean ultimate success, the other kind failures. But theories are necessary. Like the twin impulses of love and hunger, they rule the world, and are the most potent present force on earth or off it.

Concentrates.

"AUROCYANIDES" are resultant values from zinc precipitation in the cyanide process.

IT is reported that tin ore has been discovered near Salida, Chaffee county, Colorado.

OXYLIGNIT is the newest coined word and signifies the cartridge of liquid air used for blasting.

ALL the Comstock mine companies interested have signed the contract with the Truckee General Electric Co.

CYANIDE OF POTASSIUM is probably the best solvent for iodide of silver; hyposulphite of soda is also a good solvent therefor.

CARBORUNDUM is a competitor of emery in all the uses of that abrasive, and is produced in large quantities at Niagara Falls, N. Y.

UNITED STATES railroads are increasing the length of rails from 30 to 45 and even 60 feet, the advantages outweighing the objections.

THE De Beers diamond mine in South Africa is considered to be the largest mining dividend payer in the world; it paid last year $7,687,300.

ONE of the richest mines in the Aspen district, the Emma, has been in litigation almost constantly since a short time after its discovery in 1880.

THE stock of a New Jersey corporation can not be assessed; that of a Colorado corporation may be; in California (under certain conditions) it must be.

THERE is little commercial demand for asbestos in San Francisco; if of long fiber and superior quality, there might be a limited sale, delivered, at, approximately, $30 per ton

THE development and prosperity of the works of the Mountain Copper Co., at Keswick, Cal., is a good example, happily illustrative of the combination of English enterprise and American opportunity.

A PROMINENT Denver mine operator writes: "It took lots of 'nerve' to write and publish that article 'Not Thoroughly Understood,' in the paper dated Sept. 23rd, but it is worth $10,000 to you; shake!"

SUPERHEATED steam is that which is further raised by the application of additional heat to a temperature above that which belongs to its equilibrium of temperature and pressure when in contact with its liquid.

MACHINE DRILLS do not work to advantage in soft ground. The bits cut rapidly but quickly churn the soft material into a thick paste that is pounded into the bottom of the hole, retarding the operation of the drill.

BLANKETS were at one time much in use for the purpose of concentrating sulphides from tailings but they have in recent years been replaced by cheap brussels carpet or still more commonly by canvas of various grades.

JANUARY and October of the same year begin with the same day of the week. So do April and July, also September and December. February (except in leap year), March and November also begin with the same day.

WHEN required assessment work on an unpatented mining claim has been actually done, and can be definitely proved by responsible witnesses, no one can legally "jump" that claim. It is, however, safer to record the work.

SEA water is successfully employed in extracting gold by means of the cyanide process, in Chile. The fine gold found in some beach sands could probably be extracted in the same manner. It is a material well suited to leaching.

In some of the Central American countries the native miners strike single handed, using a 10-pound hammer having a handle 18 inches in length. The blows fall slowly, but in time they put a hole down. They consider a 3½-pound hammer a toy.

THE first railroad grant in the United States was made to the Illinois Central Railroad Company in 1850; the last was made to the Southern Pacific Company in 1871. During the twenty-one years was thus given to the railroads 44,261 square miles.

MAGNETITE is magnetic iron ore, usually occurring in octahedrons, also in dodecahedrons, often granular; sometimes found in dentritic form between sheets of mica, forming peculiar and interesting figures, but destroying the mica for commercial uses.

WOLFRAMITE is the technical term for tungstate of iron. Hubnerite is the term for tungstate of manganese, both of which are found in the vicinity of Gladstone, Colo. Stolzite, tungstate of lead is believed to exist in the Red Mountain, Colo., ores.

IN many of the gold-bearing veins of southern California, Arizona and southern Nevada molybdate of lead occurs in small quantity and is often mistaken for gold by inexperienced prospectors, when panning the crushed ore. It will be completely decomposed by hydrochloric acid.

AMERICAN mining machinery is securing worldwide recognition on its merits. In South America, South Africa, Australia, Russia, Japan, etc, the most advanced mine managers, regardless of nationality, stipulate that mining machinery of American manufacture shall be used.

IN a high-grade compound engine an engine horse power should be developed with from 16 to 20 lbs. of water; in non-condensing single engine from 22 to 24 lbs.; good large non-condensing, 28; average size condensing, 30; small, 30 to 45; pumps, elevators and non-expansive engines, 50 and upwards.

THE rise of the Colorado river this year has been high and prolonged to an unusually late season. The stream is sending a portion of its water through the old channel known as New river into the Salton basin. This has not occurred since 1892, and not so late in the season in recent years.

A VENDOR who brings principals together is in general considered to be entitled to commission, whether business is done direct, or through him. Such matters are, however, determined largely by special agreement, which, in case of any consequence, should be in writing, so worded that the intent cannot be misunderstood.

HUBNERITE is worth $50 per ton and upwards according to its purity. It is found in Mammoth, Nevada; Ouray and Silverton, Colorado; Lead, S. D. A small amount is used in the manufacture of steel. The Bethlehem Steel Works, Bethlehem, Pa., can give the further information desired.

THE longest electric power transmission line in the world is in southern California, the pressure being 40,000 volts; the line now building from Allegan to Jackson, Mich., is expected to be completed in 1900, ninety miles, when that will be the longest power transmission line; the pressure on the latter is 25,000 volts.

ALL the California County Miners' Associations are entitled to representation at the convention of the State Mining Association on the 23rd inst., in proportion to the number of members, and each delegate has equal voice and vote in all questions brought before the convention. Nevada county is entitled to 100 delegates, San Francisco county to 10.

IN many of the old river channels of California the trees which grew along the banks of those ancient streams were enveloped in the flow of volcanic mud and became petrified, and are found by the miners, standing where they grew but turned to stone in most cases. In others only a hollow is left to mark the tree, the wood having acted as a mould and later decaying.

SECRETARY TELLER has ruled that lands containing mineral springs, not of a saline character, are subject to sale under the agricultural land laws. By saline is meant those springs containing a large amount of chloride of sodium, for which mineral they are chiefly valuable. Deposits of rock salt and salt beds fall within the designation of the term "salines." Sulphur springs are not regarded as salines.

THE tin oxide found in the mines of the San Jacinto Estate, near Corona, Riverside Co., Cal., occurs in a black, heavy rock, composed almost wholly of fine needle-like fibers of tourmaline, some of it being massive. The cassiterite is scattered about this rock and occasionally is found in bunches forming very rich ore. The tourmaline veins are large in places but the best tin ore is found where the vein is small.

FIFTY-EIGHT questions sent to this office in the last eleven days are answered on this page. To publish the questions themselves would more than take up the page, while the condensed answers are of value not only to the questioners themselves but to the mining world in general. During the year nearly 3000 different queries on mining and scientific matters are thus attempted to be correctly answered.

UP to last week's rock drilling contest at Denver, Colo., the best record was that made by Hupps and Lindgren, at Ouray, Colo., July 4, 1898—37⅞ inches. The Victor victors last week won a $900 prize and trophy, as stated in detail on page 412. At Ouray, one year ago, Richard Conly of Cripple Creek, Colo., single handed, drilled 20¾ inches in fifteen minutes, in Gunnison granite, with a ⅞-inch drill, holding the championship to date.

A FLAME is a body or current of gas carrying in it solid particles at such a temperature as to glow or give out heat and light. These solid particles are usually carbon in a finely divided state, and the heat of the flame is roughly measured by the degree of the incandescence or glowing of these particles. Flame is produced when the supply of oxygen at the place where ignition occurs is not quite sufficient to form at once a gaseous product of the combustion.

POWER losses on an electric transmission plant are calculated as follows: Steam engine friction, 10%; loss in belting between engine and generator, 3%; loss in generator, 10%; (loss in the conductor depends on its length, thickness, care in placing, etc., but may be from 10% to 20%); loss in motors may vary from 10% to 18%. The total efficiency may thus be figured at 55%, but may be increased to 65% if the distance is short and the installation made with care.

CONGLOMERATE is a mass of gravel, sand and cobbles, all more or less rounded by attrition on a lake or sea shore or in a river bed and cemented by some material, such as lime, iron oxide, silica, etc. Breccia is a mass of material similarly cemented, but the fragments are all angular. It may be the result of a volcanic eruption or may be rock in situ which has been fractured by dynamic forces and subsequently cemented. Either may contain ores and valuable metals.

AT one time in the history of the Grand canyon of the Colorado river in Arizona volcanic eruptions occurred on the plateau in the neighborhood of the canyon and the black basaltic lava poured out over the surface and flowed to the edge of the canyon, over which it plunged in cascades, filling the canyon bottom to a considerable height. Subsequently the river has cut its way down through this hard, tough rock and through the underlying rocks, indicating that the fresh appearing lava flows, which appear that they might have been outpoured recently, are really very old.

THE first important discoveries of mines in Utah were made by soldiers under Gen. Connor, who established the military post at Fort Douglas, east of Salt Lake City, in '63. His men were the discoverers of Bingham, Stockton, Little Cottonwood and other camps in Utah, and they also found mines at Pioche, Nev. The most important mining districts of the Wasatch are at those places, where the mountains are highest and most massive—where the granite has uplifted the quartzites and limestones and in the later porphyries have intruded the sedimentary rocks.

THERE are two fixed points of temperature which are used in graduating thermometers: the point at which ice melts and the point at which water boils under a pressure of one atmosphere. The latter is given by Regnault's determinations, of 14.7 pounds per square inch above vacuum, or 2116.2 pounds per square foot. The Fahrenheit scale calls melting-ice temperature, that denoted by 32° on its scale, and boiling water temperature is 212°. Its zero point is thus 32° lower than melting ice. The Centigrade scale divides the 180° F. between melting ice and boiling water into 100 parts, and places its zero at the melting ice point. The Reaumer scale divides the 100 degrees of the Centigrade scale into eighty parts. The first named—the Fahrenheit—is in most general use.

PLACER ground containing clay can be worked successfully in a rocker but it should first be well puddled. If the clay is tough and sticky it had better be picked out by hand and allowed to lie in the weather until it disintegrates or becomes hard, for otherwise the small balls of clay produced by the rocking motion will attach all the gold with which it comes in contact and pass out of the rocker robbing the miner of his gold. Where the clay contains gold it should be burned and pulverized. This will usually free it. The quantity of ground handled by the rocker depends on the size of the rocker, character of the earth and somewhat on the quantity of water available.

MONAZITE is a phosphate of cerium mineral and usually contains also thorium. Cerium and thorium are employed in the manufacture of the white mantles used on the so called incandescent gas burners. These substances must be combined in a definite proportion in order that they shall give the maximum of light. Pure thorium or pure cerium, made into a mantle, give about one-seventh as much light as a mantle containing 99% of thorium and 1% of cerium. The remarkable thing is that so slight a quantity of cerium added to the thorium should so greatly increase the illumination, especially in view of the fact that a combination of equal quantities of thorium and cerium give practically no light.

IN the manufacture of artificial ice two methods are usually employed: in the can method the cooled brine surrounds thin metal cans within which is enclosed the distilled water to be frozen in one system: in the plate method the cooled brine or ammonia itself in coils circulates between hollow plates, say 10x14 feet in area, on the outside of which the ice forms in the water tank. In the can system blocks weighing 300 lbs. will be frozen in from fifty to sixty hours: in the plate system the ice forms 14 inches thick over their area in from nine to fourteen days. The can system is more usual for ice venders, since the supply of ice blocks is continuous, but the product of the plate system costs less although the plant costs more. The Vulcan Iron Works, 505 Mission St., San Francisco, can furnish all necessary appliances relative thereto, or a complete ice-making plant of any required capacity.

THERE is somewhat of a difference between the rights of the locator of a tunnel site and the locator of a mining claim who may desire to run a tunnel to develop his location, the mouth of the tunnel being outside the lines of the claim. If A has located a tunnel site, under the mining laws, subsequent mining locations on the line thereof are prohibited so long as work is being prosecuted with reasonable diligence in the tunnel; consequently, if B locates a mining claim subsequent to A's tunnel location, the latter is senior in point of time, and A may drive his tunnel through B's claim without his consent. If, however, A and B are each simply locators of mining claims which may be near or join each other, A. has no right to pass through B's claim, although B may be junior in point of time to A. In other words, the location of a mining claim does not carry with it the right to pass through other claims subsequently located. The consent of the junior locator is essential. In these controversies at law there is often much which does not require the services of a lawyer to determine what is right. The laws are framed with a view of justice to all; as the law guarantees to the bona fide locator of a claim the absolute possession of all within its boundary planes, it is unreasonable to presume that one may enter upon another's property for any purpose without his consent.

CONCENTRIC decomposition of rocks is a process which many massive rocks undergo when subjected to atmospheric or other decomposing agencies. By it the outer portions of an angular block or mass undergo decay, the decomposition advancing from the surface inwardly, the process seeming to develop in the rock a series of concentric layers or shells, one within another, enveloping the nucleus, which is but little or not at all altered. Undoubtedly the structure of the rock in these cases is normally concentric, a condition which it probably assumes upon cooling from the molten magma, but which would not be observable were it not for the subsequent decay of the mass. In regions where this condition obtains in massive rocks, such as granite, diorite and many other porphyritic rocks, the surface is often seen strewn with large boulders of hard rock when the main mass is soft, and may be shoveled without trouble. Where this occurs it is usually the result of the concentric decomposition, which has removed the decayed outer portion of angular masses, leaving only the nucleus. Not infrequently on the under side of these boulders the evidence of this process of decomposition may be found in the form of shell-like layers of the rock, showing it to be in situ, though having the appearance of an erratic boulder. Concentric decomposition of rocks is not uncommon in the vicinity of mineral veins. The peculiar, boulder-like formation of the masses of ore found in the Bassik mine of Colorado is due to this process.

THE separation of zinc and gold, resulting from precipitation of gold from cyanide solutions, is effected in iron vessels by digesting the material with dilute sulphuric acid. At first a quantity of acid (determined by the amount of slimes to be treated) is poured upon the wet slimes. A violent effervescence results from the first contact of acid and zinc, and dense fumes are evolved. The slimes should be stirred with a wooden hoe or paddle until the chemical action becomes less violent when additional quantities of acid may be added from time to time, and with it equal quantities of hot water, stirring occasionally. Effervescence will continue at the end gently until all the zinc has been dissolved. After being allowed to stand for a couple of hours, a little more acid may be added, when, if no further effervescence takes place, the zinc may be presumed to have been wholly dissolved. Hot water is then run into the vessel, slowly stirring the while. this is done to dissolve the zinc sulphate resulting from the action of the acid upon the zinc. It is then allowed to stand several hours, when, having become clear, it may be syphoned off, care being taken not to disturb the precipitate remaining at the bottom. A second wash of hot water is applied and when clear is syphoned off, as before. Several times this is repeated until the zinc sulphate is wholly removed. When this process is complete the precipitate may be removed to the filter box. When filtered, the precipitate is dried in an iron vessel over a fire, by low heat, several hours being required to accomplish this. There is no standard flux for mixing with cyanide precipitates. It is a matter for experiment. At Bodie, Cal., F. L. Bosqui employs on a zinc precipitate containing 36% silver and 11¼% gold, with every 100 ounces of precipitate a mixture of fifty ounces of flux containing four parts borax, two parts soda and one part sand; with a precipitate containing 36% silver and 9⅛% gold, with every 100 ounces he uses seventy-five ounces of the same mixture as above. In some works powdered glass is employed.

Deep Mining at the Utica, Angels, Calaveras County, California.*

By J. H. COLLIER JR.

The mother lode, or mineralized belt, at Angels, in Calaveras county, California, is three miles wide. At least a region of that width has been, and is being, prospected which has shown considerable mineralization. The lode proper divides into three lodes, or groups of veins, at this point. On all of these branches mines have been operated with more or less success.

On the most easterly of these three groups, and therefore known locally as the East lode, is situated the Utica-Stickle mine, in the town of Angels. This lode was in an early day worked as open cut. The cut is still open for some distance, showing the strike of the vein very clearly. The cut would also give the impression that the mine was a simple fissure deposit. Underground development, however, has shown it to be a much more complicated deposit, at least to mine.

It might more properly be called a gold-bearing, mineralized zone rather than a simple vein. The zone consists of a large mass of crushed diabase which, under pressure, has developed a slaty cleavage. The crushed mass has been more or less altered into a schist containing considerable mariposite and white mica. In this mass the ore occurs as large bodies of massive quartz of a brownish-gray color; as masses of quartz veins from 1 to 3 inches wide, interspersed with micaceous schists in a distinctly banded structure; as masses of more or less altered diabase, containing filtrated silica often in reticulated veinlets; and as impregnations in massive diabase, all containing free gold and auriferous pyrites.

In working upward on the ore bodies they sometimes change from massive quartzite to a schistose character, and thin out toward the hanging wall. Crosscuts run into the foot wall, then show the ore-making next the foot wall, and soon widening out to the original width on its upward course, thus showing that the ledge was cut off by a large horse of diabase, split from the hanging wall and fallen to the foot wall. In this way the ore body is made up of several parallel lenses or masses, at different points dipping at a high angle to the eastward with a greater southerly pitch, ranging in all from 10 to over 100 feet in width.

With this outline of the general nature of the deposit the difficulties of mining, more particularly stoping, such a deposit will be better understood. Not only must the stopes be properly supported and economically worked, but the ground must be thoroughly prospected as the work proceeds.

The prospecting must be thorough to ensure the most economical use of the long levels through which the ore is removed. These levels are often driven in extremely hard diabase, and are not only costly in driving and fitting with tracks and compressed air pipes, but are often very expensive and difficult to keep open, on account of the settling and crushing of the rock.

The prospecting, on account of the varying character of the ore, offered many difficulties, but the supporting of the stopes offered much more serious difficulties by the extreme width and chrushed character of the ore body. After many difficulties and a serious cave, simple timbering was abandoned in the stopes. At the present time timbering and stowing are used together. The timber is put in place as fast as there is room, and no opening more than 16 feet vertically is made without stowing. By this means Mr. William Miller, the foreman, has succeeded in carrying the stoping and prospecting along together, the waste from the prospect crosscuts in the wall rock being used for stowing.

Shaft Sinking.—Before giving a detailed explanation of the excavation of the ore it will, perhaps, be more logical to speak of the shafts. In all there have been four shafts sunk on this property. The North Utica, 700 feet deep, sunk a short distance back in the foot wall, is still a good shaft. The South Utica, about 900 feet deep, was sunk on the ledge, and, after being kept open to hoist ore through only, at a large expense, had to be abandoned, and now gives some difficulty in stoping around it. The Stickle shaft, 1000 feet deep, was sunk on the ledge and has been almost entirely retimbered twice, at considerable expense, at one time necessitating the shutdown of the Stickle mine and mill for about a month.

Profiting by the experience with the other shafts, the new Cross shaft, which it is intended to sink to a depth of 1500 feet, on the Stickle mine, has been sunk at a safe distance in the foot wall from the stopes. As this is the newest shaft, and represents the best practice, I will give a detailed account of it.

After the removal of the surface soil churn drills were used to put in holes 2 inches in diameter at the collar, tapering to 1¼ inches at a depth of 6 or 7 feet. The holes were charged with five or six sticks of No. 2 Judson dynamite, 1⅛ inches in diameter and 8 inches long. The powder was exploded by means of safety fuse and percussion caps.

After reaching solid rock Ingersoll Eclipse machine drill were used. Four drills were run together, two in each end hung on bars extending horizontally across the short way of the shaft, about 3 feet from the bottom. When the drillin was completed one machine was removed from each bar an fastened by means of a rope to the bottom of the bucket an hoisted to the surface. The remaining machines were the turned parallel to their respective bars and clamped. Eac bar, with its machine, is then hoisted to the surface also. setting up the machines the reverse operation is performe In this way the time and labor required to handle the m chines are reduced to a minimum. The holes are drilled sy tematically in eight rows, of three holes each, across th short way of the shaft, with a V cut in the middle, consistir of six holes. The best results were obtained by drilling th holes from 6 to 7 feet deep. The cut, with the next row

each side, was shot first and, if it broke well, the others were charged and fired as soon as sufficient rock had been removed to reach them. Each hole was charged with from six to nine sticks of the No. 2 Judson dynamite. At first safety fuse and percussion caps were used to explode the charges, but later the charges were fired by electricity.

Near the surface, where the ground is loose, the shaft is built up of 12x12-inch timber, the ends of the wall plates and end pieces being halved together. After reaching solid rock the shaft is timbered in sets 5 feet apart, which are 5 feet wide and 14 feet long in the clear. By means of the center braces the shaft is divided into three compartments, each 4 feet 4 inches by 5 feet.

The system of timbering used is what is called the horn set (Plate I). The wall plates and end pieces are framed from 10x12-inch Oregon pine. The end pieces are framed at either end with a 10-inch horn, 9 inches wide and 6 inches thick, leaving a shoulder 1 inch wide, which engages the inner side of either wall plate (Plate I, Fig. 1). The wall plates are framed with 9-inch horns at each end, 10 inches wide and 6 inches thick (Fig. 2). The center braces are of 6x12-inch timber, and are dovetailed into the wall plates at either end (Fig. 3). The wall plates have a total length of 15 feet 6 inches, and the end pieces 6 feet 8 inches. Exactly 1 foot from each end of the wall plate is a saw cut, square across the 12-inch face, for convenience in plumbing when placing the timbers in position. Near each end of the wall plates are two auger holes, 1½ inches in diameter and 6 inches apart, through which are passed hanging bolts, one passing upward to the set above, the other downward to support the set being put in place. These hangers are made of 1-inch iron, about 4 feet long. On one end is a hook, on the other a thread is cut for about 1 foot from the end.

The new wall plate is let down the shaft lengthwise by means of a chain on the bottom of the skip, which is fastened just above the middle of the timber. The timber thus hangs vertically in the shaft, and, when it has passed the timbers in place, is easily turned into a horizontal position, as the weight is nearly balanced on the chain. A hanger is then inserted in each end, with the hook upward, which engages the hook hanging downward from the corresponding end of the plate above. The other wall plate is similarly placed, and the two are then drawn to their approximate positions by means of the nuts below the plate on the hanger. The end plates are now dropped into place and the corner posts, which are 8 inches square and 5 feet long, are successively stood in place and held by drawing the wall plate and end piece up against it by means of the hanging bolts. The center braces are then put in place and the set lined by means of a plumb line over the saw cuts in the set above and the new set. The set is then blocked and wedged securely into place by blocks placed behind the wall plates opposite center braces and end pieces, and behind end pieces opposite wall plates. By this precaution only compressive strains are brought on the different members of the set. Plate II shows the horn set in place.

The hangers are left in place until two or three sets are put in below, and then removed to be used again. Skip guides of 6x6-inch Oregon pine are fastened to the end pieces and center braces by means of lag screws, with the heads sunk into the guide, so as to prevent the shoe on the skip catching on them. The shaft is lined with 2-inch plank, in 12 foot lengths, behind the wall plates and end pieces.

A cheaper form of timbering used in the inclined winze in the Stickle mine is shown in Plate III. The framing is simpler and no center braces are used. It answered very well for the purpose, but would not be satisfactory in a working shaft, especially in heavy ground.

In sinking the Cross shaft the following men were employed: Six machine men and six helpers, divided equally on three eight-hour shifts; two engineers on twelve-hour shifts; two machine men with helpers and three timber men, who worked only when the machines were running and were allowed full time each month. It was found that the timber men could work to the best advantage while the miners were drilling. All hands received $3 per day. At the end of seven months the shaft was sunk and timbered to a depth of 825 feet.

The special method used in sinking the Stickle shaft has many strong points. The only serious defect was the problem of ventilation, aggravated by the large amount of "powder gas" caused by the blasting. This defect detracted very seriously from what otherwise would have been an extremely successful method in regard to both time and economy. The shaft was down some 500 feet when the Utica Company purchased the mine. They immediately started to sink this shaft and, as the Utica was deeper than this shaft, a level was run over and a raise started. The sinking was carried on practically as already described, except that ground was encountered which gave difficulty in drilling down holes, while the up holes in the raise gave no trouble at all.

The raising was cheaper on account of the economical handling of the rock, which is brought about as follows: As soon as the raise had progressed far enough a chute door was put in at the bottom. A line of stulls was put in near one side of raise across the short way, on which was fastened, on the side toward the larger compartment of the raise, a lining of 6-inch lagging. The larger compartment was arranged for a chute, the smaller for a manway, the ladders being nailed to the lagging.

After drilling a round of holes after the same system as used for a shaft of the same size, the drills and tools were stowed in the manway. The top of the manway was covered with heavy timber, leaving a small opening for the miners to pass through. The end of the compressed air hose was adjusted so as to throw the air into the head of the raise and be safe from the blast. The fuse was fired and the last man pulled a piece of timber over the remaining opening as he descended. The broken rock then fell into the large compartment, called by the miners the "bull pen." After two or three hours the air would clear enough so that the miners could return to their work. The miners meantime had removed twenty or thirty cars of rock, so that sufficient working space remained at the head of the raise.

This method made it possible to remove the rock at the smallest possible cost, as no shoveling was necessary. After connecting with shaft above timbering was commenced, the rock being withdrawn below as the timbering advanced.

Development Work.—In exploiting the mine crosscuts were driven into the ledge every 100 feet. After encountering ledge matter drifts were run, taking out the rock from wall to wall. In this manner the full extent of the ore body was determined, as well as its average value.

These drifts and crosscuts are never timbered, unless absolutely necessary, until it is determined whether or not they are to be used in the excavation of the ore. Permanent drifts are timbered up substantially with round timber, from 16 to 18 inches in diameter. The ordinary tunnel sets are used with 7-foot legs, 6 feet apart at the bottom, leaning in at the top to support a 5-foot cap.

The excavating in the levels is done entirely with machines. From nine to twenty holes are drilled in a round, depending on the nature of the ground. The V cut is commonly used, generally with twelve holes and with the cut vertical. In this system three horizontal rows of four holes are drilled. The middle two holes of each row are inclined toward each other and come near together, or, in very hard ground unite. These two holes of each row are thus made to explode together. The outer holes of each row are inclined slightly into the wall, in order to prevent the narrowing of the drift.

The upper row always, and sometimes the middle rows, is given an upward pitch. The holes will then keep clear in most ground if drilled dry, but when water, under pressure, can be obtained, it is an advantage to keep the holes clear by this means, using a hose and a small nozzle which can be inserted beside the drill in the hole. The bottom row always, and sometimes the middle row, is given a downward pitch sufficient to make the holes hold water well. The water mixes with the drillings and is thrown out as mud by the drill, from time to time, thus keeping the hole clear. The water may be thrown into these holes with a cup or by means of a hose, as before. The water under pressure is best, as it keeps the holes washed almost perfectly free from drillings, thus greatly reducing the time required to drill the holes.

From this last statement must be excepted the case of extremely soft rocks, such as talc and micaceous schists. In these rocks the drill cuts so fast that the dust does not have time to become mixed with the water, and so packs very tight around the shank of the drill. This stops the progress of the drill, and no further headway can be made until the hole is cleaned and water again admitted to the bottom of it. As an example of an extreme case of this difficulty might be mentioned a piece of ground in which a top hole of proper pitch could be drilled to a depth of 7 feet in a half hour, while a hole of same depth with a downward pitch, drilled wet, required fully two hours to drill. In a case of this kind only the bottom holes are drilled wet.

Some ground is found to break better with the cut horizontal. This is done by drilling four horizontal rows of three holes each, with the holes of the second row from the top pitching downward, to meet the corresponding holes of the third row, which pitch upward.

In ground which is difficult to break it is found necessary to increase the number of cut holes from six to eight. In still more difficult ground the back holes also have to be increased, so that as many as twenty-four holes are found necessary. It is also found necessary, sometimes, to increase the width of the drift, in order to give the cut holes a greater cut. Whatever system is used, the holes are given as nearly as possible the same load. The most central are arranged to be shot first, followed by the other cut holes in pairs. The middle holes of the adjoining rows, on either side of the cut, come next, followed by the remaining holes in each row.

If the ground is extremely schistose, or if there is a slip or gouge seam following along one wall, nine holes may be sufficient for the first breaking to the slip or the side of the drift. If there is no gouge seam or slip, the drift may be kept straight by breaking alternately to one side and the other.

The easiest and most difficult ground to break have only a slight difference in structure. They are both schistose, and have an extremely gnarled structure. But the difficult ground has been infiltrated with silica, which has so hardened it that it has to be literally burned out with powder.

Occasionally soft and running ground is encountered, which gives some trouble. The difficulties offered by this sort of ground are overcome by an ingenious system of poling, which will be described in connection with stoping.

Stoping.—In the excavating operations an enormous amount of timber is used. This timber is all round and comes in 16-foot lengths, from 12 to 26 inches in diameter. Poles are from 6 to 12 inches in diameter, and come in 20-foot lengths, which are cut in two for use in the mine. The posts for the sets in the stopes are generally made from the timber of the largest diameter. The logs are cut in two, in the middle, for stope timbers. Posts are framed to 14 inches on two opposite corresponding sides of each end, to a distance of 3 inches from each end. The caps are framed on one side at each end, leaving 7 feet between the joggles and about 6-inch horns.

A stope is started by breasting out the ore to the full width of the deposit. Crosscuts are run into both walls, to be sure that all the ore has been removed. The opening is then timbered with 8-foot stope sets. If the ground is solid, no timbering is done until the whole mass of the rock covering the area of the stope has been removed. The posts are then set in the solid rock, with 6-inch spreaders and 12-inch round brace sprags between the posts at the bottom. A floor is then laid over the spreaders.

If the rock is loose or soft, one set is put in at a time as fast as room is made for them. In the soft ground heavy sills are laid, as shown in Plate IV, to give a solid foundation for the posts. Sills are not, as is generally supposed, an advantage in working up under an old stope. Good floors laid across the spreaders, even though they have been in place so long as to be badly decayed, are found to be more serviceable than sills. The sills are seldom in place when reached, and have to be caught up securely, or they are liable, by their own movement, to start a serious run in the waste above them. After the sill floor is opened and timbered (as shown in Plate IV, which represents a stope 36 feet wide) a raise following the foot wall is run up to the level above.

This raise is necessary for the proper ventilation of the stope, as well as the economical introduction of timber and waste into the stope, the timber and waste being thrown down the raise into the stope. The raise is located in the most convenient part of the stope and, if possible, where there is a seam of gouge on the foot wall, which greatly lessens the cost of the work by lessening the difficulty of breaking the ground. If the rock is hard and solid, machines are used and the raise is timbered with full-sized stope sets, if timbering is necessary, so that, as the stope is carried up, the timber of the stope is joined on to that of the raise. If the ground is loose, the work is all done by hand and the raise is built up solid with round timber, halved together at the ends, making the raise 4 feet square in the clear.

The second floor above the level is now started from the raise, the ore falling to the sill floors, where it is shoveled into cars. After this floor is excavated a set for the full length of the stope is lagged on tops and sides with half-round slabs, made by cutting 12-inch logs, 8 feet long, in two lengthwise. This set is then kept open for the gangway, along the line of which the chutes and manways, leading up into the stope, are started. All the remaining space to the top of the sill floor set is now filled with waste. This waste is obtained from three sources within the mine: first, from the vein rock, by hand sorting in the mine; second, from crosscuts run in the wall rock from the different floors of the stope, for the double purpose of prospecting the ground and supplying the waste; and, third, from the dead work in different parts of the mine, which is brought through the raise from the level above.

From this time the chutes and manways are carried up by means of cribbing (shown in Plate V) to within one set of the back of the stope. When the ground is heavy similar cribbing is used to help support the ground. In wide and heavy stopes a row of such cribbing is generally put in extending the full length of the middle the stope, and is stowed with waste as rapidly as possible.

The different floors are started successively from the raise. As soon as a floor has been advanced far enough from the raise to prevent the mixing of the quartz and waste, filling is commenced by throwing waste down the raise. When the floor is completed, the lower floor—remote from the raise—is stowed with waste from the crosscuts. In order to supply sufficient material for this purpose, the crosscuts, which start out with small dimensions, are widened out into large chambers. In this way no opening in the stope is kept open to a greater vertical height than 16 feet.

When a level is being worked, a large mass of rock is left in place in the ledge, opposite the shaft, until the last thing before the level is abandoned. This precaution protects the shaft, which is already weakened by the cutting of the station.

When the vein matter is badly crushed and broken up, an ingenious system of lagging, called poling, is used. Poles are run out over a cap or sprag, depending on the direction of the work, whether with or across the vein, which supports the ground until the timber is in place (Plate VI). In some cases the poles are a necessity to prevent the ground from running, in others they are put in more for a protection to the miners working beneath them. In the latter case the trouble is caused by detached pieces which continually slack away, due to the presence of water and slight settling.

In running ground, the poling has to be performed with great care. The ends of the poles are sharpened and worked in over the cap all together by working the rock loose around the points with a bar and driving the poles ahead with a hammer. As the poles are advanced over the cap, the broken rock is raked back from the points of the poles and left standing on the natural slope to prevent its running. Side poles are also put in, if necessary, beginning next the roof and working them in as the rock is removed, and the face breast boarded to prevent the loose rock running around the points of the poles. Proceeding in this way, room is made for one set at a time.

The details of this work are shown in two sets of drawings (Plates VI and VII). When the set of timbers is put in beneath the poles, a bridge-piece is put in supporting them, so that they can not come down on the cap before the next poles are started. After the poles for the next set are run out over the cap, wedges are inserted between the poles and the bridge-piece and driven until the weight is taken off the short blocks supporting the bridge-piece. The blocks are then replaced by poles. Where the ground will permit, pieces of 2-inch plank are inserted crosswise behind the poles, this adding greatly to the efficiency of the poles.

The system seems to have all the merits of the square set system used on the Comstock, at the same time being cheaper and more flexible. It is cheaper because the cheaper round timber is used and the framing is much more simple. Much of the framing is done in the mine while waiting for the partially framed timber to come from the surface, which always causes more or less delay when several crews are to be supplied through the same shaft.

It will be remembered that the caps were only framed on one side before being sent into the mine. There are several reasons for this. As the logs are not always exactly 16 feet long nor cut square on the end, it is found necessary to leave a space between the ends of the caps of about 2 inches to allow for this irregularity. This is brought about by framing the ends of the posts to 14 inches and the caps so that they measure 7 feet between joggles, which, if the log was exactly 16 feet, wou'd leave 6-inch horns. If the side pressure was great enough, this space might be reduced the full 2 inches, thus reducing the hitch formed by the two adjacent caps (if they had been framed) to 12 inches instead of 14 inches. Again, the ends of the posts not being exactly square, they would raise one of the caps higher than the other. The caps, being made from the logs, have the natural taper of the tree and so the ends are not of equal dimensions, the difference in diameter being often as much as 6 inches. As the posts in the stope do not settle equally, use is made of this irregularity to keep the line of the caps horizontal. The end of the cap of the largest diameter is placed on the lowest post. When the next set above is put in, the joggle over the higher post is cut deeper than the one over the lower post of the under set. It is, therefore, evident that the size, to which the end of the cap is framed, depends on the circumstances in the stope, and therefore can only be done to advantage in the stope.

The general dip of the ore body is nearly vertical, but in places where it bulges the wall rock sometimes has a pitch of 45°. The timbering is adapted to this case by first leaving a horn on the cap extending over the post nearest the foot wall. When this horn must be so long as to greatly increase the weight of the cap, a short butt cap is used instead. This butt cap is framed the same as an ordinary cap on one end; on the other it is beveled to fit the wall rock. The length of the butt cap is increased as the wall recedes, until the distance between the post and the wall rock becomes great enough for a full set. A hitch is then cut in the foot wall for another post. While the caps on the footwall side have been lengthened, those on the hanging wall side have been correspondingly shortened. Full sets are also dropped on the hanging wall side as they are taken up on the footwall side. By these means the system may be applied to a ledge which has a comparatively small angle of dip, as well as considerable width.

The method, as a whole, has as much rigidity as the extreme width and the constant settling of the ledge will permit, combined with a sufficiently low cost, to allow of its being applied in the excavation of large bodies of comparatively low-grade ores.

Hoisting and Tramming.—Each shaft is supplied with a double acting water-power hoist. Two Dodd water wheels, 9 feet in diameter, are placed on the pinion shaft in reversed position, so that power may be applied to run the hoist in either direction. The water is applied through three nozzles, so that the power can be readily proportioned to the load. The nozzles are served by a 10-inch wrought-iron pipe, which delivers the water under a head of 420 feet, giving a standing pressure of 180 pounds, which falls to 130 when the hoist is in operation.

Wire ropes, 1 inch in diameter, are used on 5-foot drums. The ropes, which last from three to eight months, are inspected daily, and at the least sign of failure are condemned and removed. The rope passes from the drum over a 7-foot sheave wheel at the top of a gallows frame, 80 feet high.

Two skips are used, each covered by a sheet-iron bonnet and supplied with an automatic safety clutch. When the skip descends faster than a certain rate of speed, which can be regulated, a parachute under the bonnet raises and releases the clutches which grip the guides, and so arrest the descent of the skip.

The rock skip is constructed of sheet iron, with a capacity of two tons. It is loaded from the chutes in the shaft at the different levels. At the surface it is dumped automatically by means of a curved switch, which turns the sheet-iron box containing the ore out of the line of the guides over a chute leading to the rock breaker. The frame remains on the guides, and, as it ascends, it turns the box bottom up on the axis at the bottom of the frame. The skip frame is then lowered, which turns the box back again into position, where it is locked automatically.

The water skip is also made of sheet iron, 3 feet square and 8 feet long, holding about 500 gallons of water. The tank is filled through a butterfly valve in the bottom of the tank. When it reaches the surface, one wing of the valve is opened automatically by a system of levers, which are actuated by a bumper on the gallows frame, and the water is discharged into a tank at the side of the shaft.

On the levels ton cars are used to transport the ore from the stopes to the shaft. The cars are constructed of sheet iron and run on light T iron rails laid on 3-inch ties. The tracks are laid along the line of the chutes leading up into the stopes. The cars are loaded from these chutes and run out to the shaft, where they are dumped into a chute, which has a capacity of fifty or sixty tons. This chute has a door opening into the shaft through which the skip is loaded.

Pumps.—The drainage of the mine is further provided for by a pumping plant consisting of two 7-inch bucket and one

8-inch plunger pumps. This plant is run by a 6-foot Dodd wheel, geared to a long reciprocating rod in the shaft, which supplies the power to the pumps at the several stations in the shaft. The capacity of this plant is about seventy-five gallons per minute, from a depth of 900 feet. Most of the water is handled, however, by the water skip.

To supply a 60-stamp mill with about 300 tons per day requires two shifts of forty-five men each, consisting of miners, helpers and shovelers, working on ten-hour shifts. The two shifts alternate on night and day shifts, changing every two weeks. Each shift consists approximately of twelve miners, each with a helper, about fifteen shovelers, and six men running the cars on the level. This division of the working force is not constant, as it depends on the conditions in the mine, which are constantly changing. When the broken rock is plenty and easy to get at some of the miners may be put to shoveling pay rock, and some of the shovelers put to work on the stowing. On the other hand, if rock is short some of the shovelers may be added to the force of miners. The miners are paid $3 per day; the helpers, shovelers and car men are paid $2 50 per day. In addition to these two shifts, a crew of ten timber men is also necessary, receiving $3 per day.

I would have been glad to add data as to the cost of the excavation of the ore, but as I was not in possession of any official data I thought it would not be best to give an estimate without the company's permission. For the opportunity to collect the information which this paper contains I am indebted to the kindness of Mr. William Miller, under whom I have worked for about two years, as well as during the vacation periods of my junior and senior years at the University of California. I am also indebted to Mr. C. D. Lane and Mr. Alvinza Hayward, through whose courtesy not only I, but several others in the College of Mines, have been able to gain considerable valuable experience in the mines at Angels.

FIG. 1.—COMPLETED ROCK CUT, CHICAGO DRAINAGE CANAL.

An Historical Automobile.

An illustration appeared in the *Mechanics' Magazine* for January, 1834, and is thus described in the accompanying text: "The carriage represented in the drawing is built to carry fifty passengers. The wheels are about 6 inches broad in the tires and 8 feet in diameter. The crankshaft worked by the cylinders is connected by an endless chain with the axles of the hind wheels of the carriage, and each wheel has a separate axle. The spokes of the wheels are so constructed as to operate like springs to the whole machine—that is, to give and take, according to the inequalities of the road. The boiler consists of a series of double tubes, one within the other, placed in a vertical position around a circular fireplace and communicating with it; the heated air passes through these tubes, which are everywhere surrounded with water. The tubes are in the form of siphons, to counteract the effect of unequal expansion. The draught is produced by a fanner worked by the engine, and the furnace is made to consume its own smoke. Birmingham, Oct. 3rd, 1833."

ON the electric railway now building between Kansas City, Mo., and Leavenworth, Kan., are being used seventy-six miles of 350,000 circular mils aluminum cable.

A Great Engineering Project.

In sixty days Chicago expects to turn the water of Lake Michigan into the drainage canal which has been in progress of construction since September, 1892. This canal, which is thirty-five miles long, was originally intended to be the means of purifying the water supply of Chicago. This it will do, but as the preliminary work went on larger scope developed, and the idea now is to also employ this great artificial waterway for the purposes of navigation between Chicago and Lake Michigan, via the Des Plaines and Illinois rivers, to the Mississippi and thus to the sea.

The accompanying illustrations give some idea of the work. It is one of the great engineering enterprises of the century, and will doubtless be an active success by the close of the year. The excavation proper involved the removal of 26,000,000 cubic yards glacial drift and 14,000,000 cubic yards of solid rock. Beside this was surface excavation; rivers and their overflow had to be taken care of, and in some instances the tools and appliances had to be invented or specially built. The cost of the canal is over $30,000,000. It will be 22 feet in depth. The span shown in Fig. 1 is 700 feet; the head tower on the right is 93 feet high: that on the left 73 feet. How the side walls are built is shown in Fig. 2. These retaining walls are 30 inches thick and average 18 feet in height. The great progressive city will, doubtless, have due celebration of the opening next December of the big waterway that gives it ocean access.

FIG. 2.—BUILDING RETAINING WALLS, CHICAGO DRAINAGE CANAL.

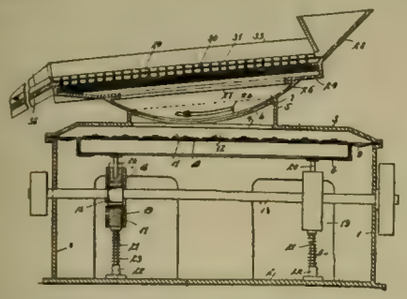
Deep Mining in Nevada Co., Cal.

TO THE EDITOR:—Being personally interested in the gold mining industry of Nevada Co., Cal., and its future, I address this letter to you in reference to what impressed me as most worthy of consideration in the speeches made at the banquet to the American Institute of Mining Engineers in Grass Valley, Cal., which may perhaps interest some of your readers. President Douglas suggested that the mines of Nevada county, in his judgment, needed the services of educated mining engineers; that modern mining elsewhere had proven that there should be no hesitation in sinking to deeper levels there; that in sinking, above all things, to crosscut, as parallel veins he had seen in the Empire mine had proven its advisability.

Mr. Ferry, a Canadian mining engineer, described a mine in Washington, where the veins greatly resemble those of Grass Valley, which mine barely held its own whilst sinking and drifting on a vein, from which vein later a 2-foot crosscut uncovered a parallel vein of fabulous richness, on which drifts are now being run alongside of the former. In Grass Valley heretofore the educated mining engineer has not been consulted as freely as in other parts of the world. This is partly due to the fact that most local mine owners have looked to the practical miner instead, who, as stated in an article on the first page of your issue of Sept. 30th, "gives most of his thought and attention to the conditions he finds from day to day in his shaft or in the face of his drift, giving little thought to the broader questions involving the origin of his vein and its relation to its surroundings."

Whilst in Grass Valley, recently, I was much interested in small machine drills (which can be readily handled by one man) for stoping in small veins, and would suggest their consideration to mine owners. Mr. Foote of the North Star mine, following in the footsteps of Mr. Stow of the Gold Bank mine of Butte county, Cal., is obtaining economical results with them.

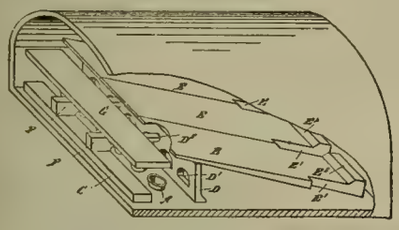
J. R. K. NUTTALL.



IT is not always possible in mine examinations to measure "ore in sight" as though it were a bin, particularly in an old mine, where the ore is irregular.

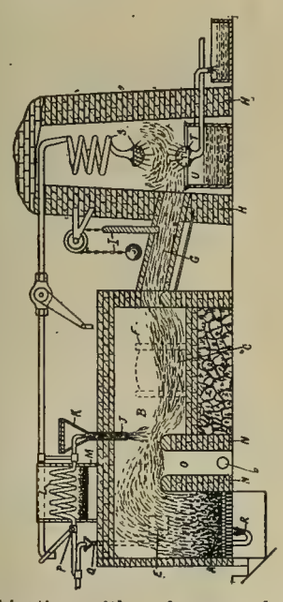
Latest Mining and Metallurgical Patents.

Patents Issued Sept. 26, 1899.



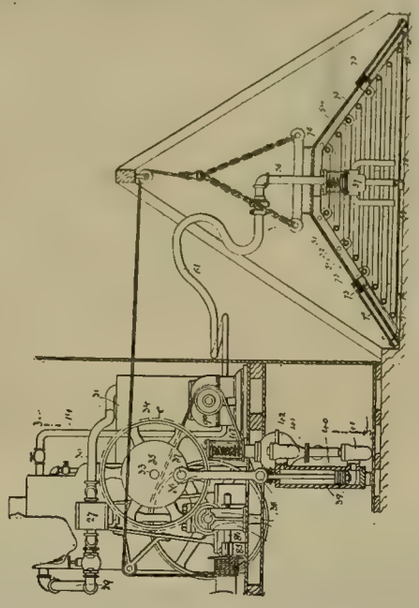
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ORE SEPARATOR.—No 633,456; W. Hooper, Ticonderoga, N. Y.



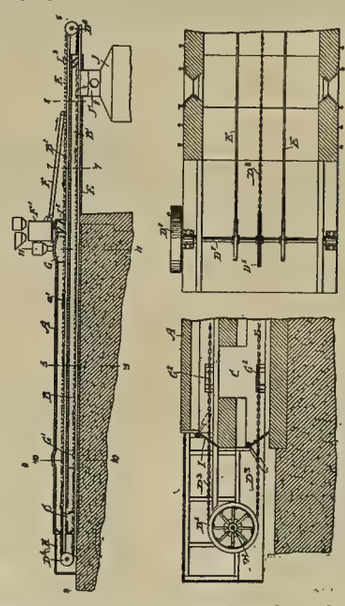
A separator comprising a frame or casing, a bed of flexible material secured in frame or casing and inclined from its longitudinal center to each side of the casing, strips of metal or the like on the upper side of the bed, the strips being extended from the center of the bed laterally at an acute angle, plates extending longitudinally of the bed near the upper part of the inclined surface thereof and at each side of its longitudinal center, forming a central conduit; separator strips on the first-mentioned strips and arranged at a reverse angle thereto, the strips extending from the outer side of each longitudinally extending plate to the frame or casing, and a dam extending across the frame or casing at its outlet end, the dam being connected to the lower series of the first-named strips and of equal height therewith, means for adjusting the longitudinal incline of the separator, and means for agitating the flexible bed.

CUPEL COOLER FOR ASSAY FURNACES.—No. 633,462; W. D. Longwood, Deadwood, S. D.



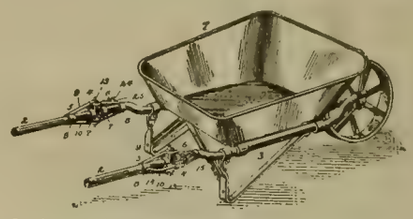
A cupel cooler for assay furnaces, comprising a flat tile bar, a tile having two sets of openings therein and arranged to be set on edge to form a vertical partition, a shield or cover formed of a plurality of tiles adapted to rest at one end on the partition and having their edges at the other end cut out to form openings and each provided on one side with a projection at end, bars adapted to rest upon the first-named bar and to engage one set of the openings in the partition, and a tile plate adapted to rest upon the bars, the whole being adapted to be arranged in a muffle.

APPARATUS FOR PURIFYING AND RECOVERING METALS, ETC.—No. 633,568; W. J. Clapp, Birmingham, England.



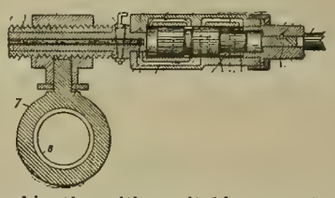
The combination, with a furnace, of a vessel for holding a purifying agent such as powdered lime, a steam pipe for blowing the agent into the heating chamber of the furnace, means for superheating the steam in the pipe, a stack receiving the gases from the heating chamber, a water bosh in the base of the stack, a spray pipe for water projecting upwardly into the stack, and a spray pipe for steam projecting downwardly in the stack, the gases from the furnace being admitted to the stack between the two spray pipes.

THAWING APPARATUS.—No. 633,627; C. Taylor and C. E. Robertson, Montreal, Canada.



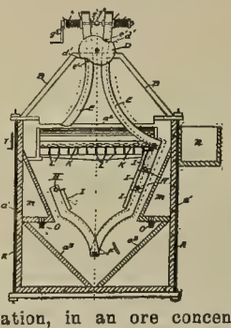
A thawing apparatus comprising a length of pipe coiled in conical form, a reflecting conical shield adapted to extend over conical coil, an air heater, an air supply to heater, a conductor for the heated air connecting air heater to coil and an outlet from coil adapted to spray the heated air upon the substance to be thawed, conductor consisting of a pair of tubes located one within the other, the outer tube being constructed with a reflecting interior surface and covered with insulating material, the inner tube being of sufficiently smaller diameter than the outer tube to provide a space between tubes, and a series of spiders located at intervals along inner tube and adapted to maintain the space between tubes. A combined steam generator and air heater; an engine; a communicating pipe connecting steam generator to engine; an air compressor, an operative connection between engine and compressor, a communicating pipe connecting air compressor to air heater; an adjustable yielding check valve adapted to control the passage through pipe; a heat distributing device; a flexible conductor connecting the air heater to distributing device; distributing device comprising a coil of pipe having its discharge end controlled by an adjustable yielding check valve.

CALCINING FURNACE.—No. 633,777; C. M. Allen, Basin, Mont.



A calcining furnace provided with a plurality of hearths located one above the other, the uppermost hearth being shorter than the hearth beneath it, leaving one end of the roof of the lower hearth exposed to form a drying floor leading to the entrance end of the upper hearth, the other end of the upper hearth being connected with the unexposed end of the lower hearth which is provided with a discharge at or near the end of its exposed portion, the material to be treated traveling over drying floor and through the upper hearth in one direction, to then travel in the reverse direction in the lower hearth, floor being capable of freely taking up the high heat emanating from the outwardly moving material in the exposed portion of the lower hearth, floor being also capable of imparting such heat to the material passing into the upper hearth, feed devices for discharging the material to be calcined on the outer end of the drying floor, whereby the material is heated in the open air, to be dried for the purpose described, plowing or agitating devices, means for moving devices through the hearth from one to the other, a receptacle at the discharge end of the lower hearth, to receive the calcined material and the gases from the lower hearth, inlets for the products of combustion to the hearths at or near the entrance ends thereof and an outlet for the products of combustion at the discharge end of the lowermost hearth.

ATTACHMENT FOR WHEELBARROWS.—No. 633,648; C. W. Kauffman, Deadwood, S. D.



A device of the class described comprising a hinge designed to connect a folding handle with the body portion of a wheelbarrow and a locking device composed of longitudinal bars provided at their adjacent ends with lugs, one of the bars having a lip extending beneath the other bar, a lever fulcrumed on the bar having the lip and having its engaging end opposite the same and a spring holding the lever in engagement with the lugs, the spring being substantially V-shaped and composed of two sides detachably interlocked with the lever and with the adjacent bar.

AIR DRILL.—No. 633,661; A. P. Schmucker, Denver, Colo.

The combination with a suitable support, of a hollow feed screw mounted thereon, an air tube passing through the feed screw, a cylinder attached to its forward extremity and provided with ducts communicating with the air hole and arranged to deliver the air to the front and rear of the piston, a piston located in the cylinder chamber and adapted to be reciprocated by the action of the air, the piston being fashioned to allow the air to cross the chamber from one duct to another, a drill supported to be actuated by the reciprocating piston, and suitable means for rotating the air tube, the cylinder and their attachments, comprising a rotary motor attached to the screw shaft, a gear wheel fast on the air tube, a pinion operated by the motor and meshing with the gear, and a suitable means for conducting the air to the motor, comprising a tube or conduit communicating with the hollow air shaft at one extremity and with the motor chamber at the opposite extremity.

ORE CONCENTRATOR.—No. 633,686; G. T. Cooley, Joplin, Mo.

The combination, in an ore concentrator, of a water tank; a gate, or sieve, mounted in the upper portion thereof; a pair of wing arms carrying swinging valves or gates and adapted to be reciprocated under the sieve or grate; springs tending to press the pair of wing arms together; a cam adapted to contact with the rollers carried by the wing arms, forcing them slowly apart and permitting them to be suddenly thrown together; water supply compartments, containing water under pressure and spring-pressed valves in the supply compartments communicating with the space back of the wing arms.

Cyaniding at Gilt Edge, Montana.

Written for the MINING AND SCIENTIFIC PRESS by MATT. W. ALDERSON.

The western end of Montana is mountainous, while the eastern end is a rolling plain. From the main mountain range on the west a few ranges branch out called the Tobacco Root, Big Belt and Little Belt ranges, respectively. East of these are several small, comparatively isolated, ranges, known as The Crazy, the Snowy, the Little Rocky, the Highwood and the Judith. In the latter, a range about eighteen miles in length by five or six miles in width, and almost in the geographical center of the State, are gold mines which have attained considerable prominence, notably the Spotted Horse, the Maginnis and the Gilt Edge. The country to the east, north and south is practically unbroken for hundreds of miles. To the southwest is the Snowy and to the northwest the Highwood mountains, while to the west is the broad Judith basin, a rich agricultural and stock raising basin fifty miles in diameter.

The Judith mountains rise above the level of the surrounding country some 2500 feet, and the highest summit is 6880 feet above sea level. As one approaches these mountains he is impressed with the beautiful crags of grey lime of the Carboniferous age, which is the prevailing country rock. At their feet he passes over the upturned edges of the coal-bearing sandstones, and the camp presents the beautiful spectacle, at the New Year group, of a gold mine worked on top of a ridge, with a mill at the foot, the power for which is furnished by fuel mined practically at the door of the furnace room.

The district is greatly handicapped by its remoteness from railroads—over 100 miles in any direction—though five stage lines furnish connection with the outside world. The mines of the Maginnis group are idle. Some work is being done on the Spotted Horse mine, which in the past has produced over $500,000, but otherwise none of the properties worked as free milling years ago are in operation. The Spotted Horse, discovered in 1880, was the first mine opened in the district, and it and the properties of the Maginnis group were worked on an extensive scale for years. No efforts were made to save the tailings from the Spotted Horse and they flowed down the gulch. To-day there are four cyanide plants treating these tailings and making money by so doing, though the method of handling them could be very materially improved upon. At two of the plants an extraction of $5 to $6 has been obtained, and at one of these the tailings are now being treated over again and a further saving of about $3.50 a ton is secured. The material is finely ground, but not sufciently slimy to prevent percolation, though the slimes sometimes retain a considerable proportion of the values; otherwise there seems to be no difficulty in treating the tailings. Most of the plants are owned and operated by persons having little technical knowledge of the cyanide process, and checks on the work by assaying are considered unnecessary.

The first attempt to work the ores at Gilt Edge was in 1892, with a Huntington mill, but the venture was a failure because of lack of free gold in the material. A Mr. Sherard, who had obtained a little knowledge of the then new cyanide process while employed at the Revenue mill, became interested with the then owners, Messrs. Collins & Armington, and a cyanide plant was put in in 1893.

The crushing part of this old mill was a rock breaker and a Chilian mill, where the wheels revolved on stationary axles, the bed traveling under the wheels, the crushed ore being scraped back and forth over a slotted cast iron portion of the bed about 1 foot wide outside of the solid portion, over which the large crushing wheels revolved. This crusher is said to have handled satisfactorily thousands of tons of ore a year, and would easily crush 100 tons a day to such size as was deemed necessary for successful leaching.

Some difficulty in precipitation was found when the mill first started, but this was finally overcome and the plant has been in operation almost continuously since, though it has had a very checkered career, principally because of bad management. Some years ago the property fell into the hands of a New York speculator, who soon wrecked the entire proposition. It then fell into a receiver's hands. This gentleman—Mr. Woodbury—had a business head on him and he operated the property, making a financial success of his trust. E. W. King, who had put in the water works and the first electric light plant at Great Falls, with L. G. Phelps, a banker of that city, purchased the property and ran it for some time. In August, 1898, they parted with two-thirds interest to the Great Northern Mining & Development Co., Mr. King being retained as manager. A new mill was constructed at the mine and the accompanying illustration gives a very clear idea of it and the nature of the surrounding country. It is the largest, finest mill in the State treating ores by cyanide direct. In the illustration the machinery and engine rooms are first on the left, the crushing room and ore bins in the center, and the tank room on the right, with precipitating room in the lean-to in front. The machinery and engine room is 56x84 feet, the tank floor 32x180 feet, solution room 16x30 feet, and the room occupied by the extractors and for cutting down the product by sulphuric acid 32x44 feet.

The ore enters the mill in cars direct from the mine, the main ore bin, back of the mill, as shown, being 19x33 feet, 26 feet high. From here it falls onto an endless belt which conveys it to a No. 5 Gates crusher. It passes thence to a revolving dryer of the usual type. The fuel used is coal, obtained from a mine three miles distant, but the company expects soon to open a mine of its own within 1½ miles. The coal costs $5.00 a ton and 850 pounds are required to dry 100 tons. The cost for drying is 2½ cents per ton and the ore leaves the dryer carrying 4% moisture. The dry ore is then elevated to the top of the mill, where it falls on a grizzly. Such ore as passes this grizzly goes direct into the ground ore bin, which has a capacity of 100 tons. The ore which does not pass the grizzly now goes to two Gates rolls, each 15x30 inches, the coarse to one and the fine to the other. The crushed ore then passes to revolving trommels, from whence such as passes ¼-inch round holes is elevated to the crushed ore bin and the rejection goes again to the rolls.

CYANIDE PLANT AT GILT EDGE, MONTANA.

The leaching room contains six steel vats, each 28 feet in diameter by 3 feet high. They are charged from the crushed ore bin by an iron car driven by a wire cable and thirty minutes is all the time required to load a vat with the usual charge of seventy tons. Seventy-two hours are given to each vat, from the time of one filling to the next. Of this time twelve hours is required for emptying. The leached ore is discharged from the vats, through a hole in the center of the bottoms, to cars which are conveyed to the dump by an endless rope. On account of the presence of considerable kaolin and talc in the ore and the scarcity of water sluicing is not deemed advisable, but a mechanical contrivance for moving the tailings by machinery is being experimented with in an endeavor to save shoveling and expedite the emptying of the vats.

The first solution used contains 4% cyanide (eight lbs. to the ton). Of this, about one-quarter of a ton to each ton of ore is used and this is allowed to remain in contact with the ore for eight hours. What is called the leaching solution, carrying .24% to .25% cyanide (five pounds to the ton) is then turned on through a 1-inch hose and this percolates slowly through the material for fifty-two hours. The ore is then washed twice, about six and a half tons of fluid being used for each wash on a seventy-ton charge. The first wash is fluid that has been used as second wash on a previous vat and after being used twice goes into the leaching solution. The final wash is always clear water and the vacuum pump drains the charge after this wash. The ore enters the leaching vats carrying 4% moisture and is discharged carrying 13%, showing a waste of nine tons of fluid to each 100.

There are two solution tanks, each 12 feet in diamater by 4 feet in height, one sump tank 14x4 feet, one water tank 14x12 feet. The precipitation room contains six zinc boxes. The product is refined by the use of sulphuric acid. The ore contains very little silver and is remarkably free from base substances generally. The refined bullion is 900 to 950 fine and the bars of almost pure gold, containing in the neighborhood of sixty ounces each, are as handsome in appearance as one ever sees.

The company owns seventeen different mining locations but the ore treated at present is derived from four only. Of these the Chicadee and Lookout are the principal producers. The Chicadee is the mine near the mill and the ore occurs here in large pockets, sometimes 100 feet in width. It is good ground to hold up; some square sets are used, at other times heavy stulls and in some places cribbing and filling are resorted to. The lowest depth attained is 290 feet.

The great body of the ore treated is porphyry and altered lime. There is very little quartz and the ore does not contain on an average over 20% silica. The porphyritic ore assays from $3 to $10 and the lime as high as $120 per ton. Everything assaying as high as $3 goes to the mill. The ore treated averages about $7 and the tailings assay from 40 cents to $1.40, the average being less than $1.00. Work on the new mill started in September, 1898 and finished in February, 1899. Its cost is given at $75.000. Its capacity is 140 tons a day. During July, 1899, it handled 2800 tons at a cost per ton for milling of $1.32. The mining during this period cost $1.41, making the total cost for mining and milling $2 73. The cyanide consumed for this month was 2580 pounds, about eight-tenths of a pound per ton. The motive power of the mill is a 125 H. P. Corliss engine, for which two 65 H. P. boilers furnish steam. A 3-drill Rand air compressor is used in the mine, and both mine and mill are lighted by electricity.

RECOGNIZING one's voice through the telephone makes it doubly hard to realize that the voice one hears over the telephone is not the voice of the person who is talking. It seems almost exactly like the real tones, drawn out thin and small and carried from a long distance by some mechanical means—but it isn't. When one speaks into the instrument, a little diaphragm, like a drumhead, begins to vibrate, and each vibration sends a wave of electricity over the wire. These waves set up a mimic vibration in another diaphragm at the opposite end, which jars the air and produces an imitation of the original voice. This is not a scientific explanation, but it is the fact.

ABOUT 650 tons of lime and 615 tons of coal are theoretically required to make 1000 tons of carbide. In practice, 1025 tons of lime and 710 tons of coal are necessary to make that quantity.

ELECTRIC HEADLIGHTS are now in use on San Francisco street railway cars, and electric foghorns are projected on the California coast.

THE Illinois Central R. R. Co. has equipped and placed in operation an inspection car propelled by a gasoline motor.

Mining Summary.

ARIZONA.

Yavapai county has 299 patented mines—the largest number of any county in the Territory. Cochise county has 236, Pima 152 and Mohave 99. Yavapai's total assessment of mines and improvements is $953,090, that of Cochise $564,007. Of the $953,090—the assessed valuation of the Yavapai mines—the United Verde mines at Jerome are assessed, including Mr. Clark's private holdings, for $500,000—over half of the total assessed valuation of the mines in the county. Following is a table showing the assessment of patented mines:

County.	No.	Patented Mines.	Improvements.	Total.
Cochise.....	236	$ 17,050	$ 72,874	$ 89,924
Graham.....	74	214,990	349,017	564,007
Gila	53	152,900	.....	152,900
Maricopa....	14	7,300	.....	7,300
Mohave.....	99	38,674	87,205	125,879
Pinal.....	37	39,500	75,840	115,340
Pima.....	152	59,100	13,000	72,100
Santa Cruz .	40	35,000	1,935	35,935
Yavapai....	299	329,812	623,278	953,090
Yuma.....	18	2,550	70,170	72,730
Totals.....	1,022	$896,876	$1,393,319	$2,190,095

J. B. Seager has filed deeds for record transferring the Helvetia group of copper mines, for $5,000,000, to the Helvetia M. Co. These mines were purchased nine months ago for $50,000. The mines are thirteen miles east of the Azurite mines.

GRAHAM COUNTY.

Graham *Guardian*: Fifteen and one-fourth tons of copper ore from the Laurel mine, in the Lone Star mining district, netted the lessees $1183.24. It was bought by the Arizona Copper Smelting Co. This ore was taken out in six weeks by two men. In addition to taking the ore out, they completed a tunnel during the time, which taps the vein at considerable depth.——Three new whims have been taken to the San Juan group, belonging to Qualey Bros. The Arizona Copper Co. have added forty miners to the force on the San Juan group ——The Arizona & Boston Copper Co., owners of the Lone Star of Texas group, lately bought from Lindsey & Anderson, have ordered the machinery to commence development. The first work will be the sinking of a 300-foot shaft on the Lone Star Extension and the timbering of the present 137-foot shaft.

Phœnix *Republican*: The Trumbull Copper M. Co. are working twenty men on properties recently bonded from Mr. Albritton and others on the San Carlos strip. A shaft is being sunk on the vein of the Richard Stonewall mine, down 125 feet and shows fine ore.——J. Bull and associates are to make another shipment of ore from the Copper Queen mine, on the strip.

PIMA COUNTY.

G. H. Sisson has sold to the Oxide Copper Co. of New Jersey thirty-five copper claims in the Silver Bell district for $5,000,000. These mines are in the same belt as the Rosemont, Helvetia, Azurite and Neilson Smelting Co.'s mines. It is reported that the purchase is in the interest of the Standard Oil Co.

Twenty stamps are being added to the Mammoth mill.

YAVAPAI COUNTY.

It is reported that the News mine, near Jerome, has opened a vein 14 feet wide, 5 feet of which is solid smelting ore, at a depth of 150 feet.

It is locally reported that W. A. Clark has refused an offer of $100,000,000 for the United Verde property at Jerome.

YUMA COUNTY.

The King of Arizona gold mine has shipped its first bar of bullion and is running steadily.

CALIFORNIA.

Alameda.

W. W. Mendenhall of Livermore has an option on the Hardin tract, near Pleasanton, with the right to bore, excavate, mine and develop petroleum and other hydrocarbons. The grantor is to be paid as a royalty one-tenth of the petroleum products.

Amador.

At the Oneida mine excavating for a 60-stamp mill is in progress.

The Mutual, a new property north of the Lincoln, is being developed by S. R. Porter.

Jackson *Ledger*: The Zenith M. & D. Co. has been organized at Stockton; capital stock, $250,000; J. A. Drains Jr., Oakland; W. B. Mathews, French Camp; W. L. Morrow, Plymouth; Nathan Nevin and W. C. Blodgett of Stockton. The company will operate near Plymouth.

Sutter Creek *Record*: The strike made in the Keystone mine at Amador City last week is holding out.——Arrangements are being made to start sinking a three-compartment shaft at the Fremont claim which adjoins the Gover and is included in the group owned by that company.——Supt. C. R. Downs has men at work on the Bunker Hill fixing roads and getting in readiness to begin sinking.

Butte.

At the Golden Trout mine, above Lumpkin mill, thirty men are employed. The company is building a quartz and a saw mill. At present both mines will be run by steam power. The company owns a good water power and it is probable that later they will be run by water power.

The Cheibecke mine, twelve miles from Oroville, near the North Fork of the Feather river, is being negotiated in London.

Oroville *Mercury*: The Gold Bank mine at Forbestown is equipped with a 40-stamp mill, canvas and chlorination plants. The mine is worked through an inclined shaft, the collar of which is several hundred feet below the upper levels of the mine. Two years ago a tunnel was driven into the mountain from a point 795 feet vertically below the collar of the shaft. At 1200 feet from the mouth of the tunnel a mineralized formation was struck, 60 feet in width. The tunnel was continued until it was 1861 feet in length, when an upraise was started under the formation mentioned. This upraise tapped the main shaft in a distance of 1118 feet. It has been enlarged to the same size as the shaft. All drifts are in the ledge nearly their entire length. The ledge varies in width from a few feet to more than 20 feet. There are places in the old works where it measured 28 feet. The ore is heavily sulphuretted. Machine drills are used in the drifts, and baby drills, operated by one man, in the stopes. H. P. Stow, one of the principal owners, is Supt.

Oroville *Register*: The Spring Valley hydraulic mine at Cherokee sent large quantities of sand and gravel down years ago to the vicinity of Pentz. This body of tailings, three miles long and a quarter to a half mile wide, is now being worked. Ballard & Hall of San Francisco and B. G. McLain of Magalia have put in a plant for working this debris. An elevator put in by the Risdon Iron Works will handle from 2000 to 2800 cubic yards in twenty-four hours. Fourteen men will be employed. B. G. McLain will superintend the mine. Two thousand two hundred and fifty feet of 16-inch pipe has been put in. There will be two flumes used and water will be obtained from the Cherokee ditch. The black sand will be saved and sent to the Selby Smelting Works. It is said this black sand will average from $340 to $450 a ton.

Calaveras.

The Garner mine, located on the Mokelumne river, near Big Bar bridge, which has been operated by S. H. Lucas for several years, has developed a long shoot of ore of uniform grade. The mine has recently been sold to Messrs. Posey of Colorado, Holmes of Salt Lake, Corrum of Massachusetts and E. M. Houghton, who took possession of the property on the 2nd inst. A corporation has been organized, which will be known as the Calaveras G. M. Co. The mine will be operated with machine drills. A new hoist will be put in to be run by compressed air. The ditch which supplies power to the mill, located on the opposite side of the river in Amador county, is being enlarged and a double penstock built, to run two turbine wheels, one of 25 H. P. and the other of 60 H. P. A new and larger compressor will also be added and a larger number of drills put in the mine. A pipe line connects the mill and mine, crossing the river on a suspension bridge made from old mine cables. This mine has a vein 2 to 6 feet wide, and is so situated that ore can be mined and milled at a cost of about $1 per ton. This is made possible by the fact that the power for running all machinery at mine and mill is direct from the free water power of the Mokelumne river, under low head, 12 to 14 feet. The ore is transported to the mill by gravity a portion of the distance, thence by mules to the foot of an incline, up which it is drawn into the mill by cable, on a winding drum on the breaker floor.

The Ames Estate of Boston, Mass., which recently bought the Empire copper mine at Copperopolis, has now bought the western extension of the Union mine and the 300-acre ranch of J. M. Lewis of that place for $6500.

The mines and mills of the Utica-Stickle Co., at Angels, are closed temporarily owing to shortage of water supply. During this time the electric plant will be installed, which when completed will furnish power for mines and mills.

It is reported that the Esperanza mine, two and a half miles from Mokelumne Hill, on Indian creek, is to resume operations.

The mines of West Point district nearly all occur in grano-diorite, the only notable exception being some veins one and one-half miles west of West Point where they are found in dykes of dark green diorite. The ores of this district are usually heavily sulphuretted, carrying principally pyrite, pyrrhotite, chalcopyrite and a little blende and galena. The values are principally in gold and in many of the veins runs over $50 per ton. The ores occur in shoots as elsewhere. In some portions of the district small veins are numerous, but those carrying high values have been worked to shallow depth by miners whose only capital was their muscle, and, as a result, there are hundreds of small dumps scattered about. This feature is particularly noticable about the settlement known as Bummerville, a short distance east of West Point. The ores having been worked out to water or to sulphides the mines are abandoned or worked in a small way by "coyoters." The Blazing Star, near West Point, it is reported, is to be started up once more. It has a complete equipment consisting of hoist, mill, chlorination and cyanide plants. The mine has been extensively worked down to the 400 level.

San Andreas *Citizen*: The Melones M. Co., at Robinson's, employs 226 men. The tunnel, which is to connect the 120-stamp mill, now in course of erection, with the shaft of the Reserve mine on Carson Hill is in 1300 feet. Its length will be 4000 feet. Three shifts are maintained, work being prosecuted with compressed air. The mill will be 225x320 feet.——At the Sheep Ranch mine 150 feet of water has been removed since bailing was started and two levels have been cleared. Caves and repairs to the shaft retard the work. An engine and a 200-light dynamo have been delivered at the mine.

Jackson *Republican*: The Violet mine, near West Point, is operated by E. G. Keeney. The property is worked by a tunnel which has been run on the vein 40 feet. At the mouth the ledge is 4 inches wide, but in the breast it is 30 inches in width. The ore pays $10 per ton. A 3-stamp mill is on the ground. ——The Leeper-Bennett mill on Angels creek is crushing ore from the Pilot Knob mine, adjoining the Gold Cliff mine on the west. The ore averages $2 per ton in free gold. The sulphurets are valued at $60 a ton.

Del Norte.

The Del Norte copper shipments to the Selby Smelting Co. average over 20%.

El Dorado.

Placerville *Nugget*: It is reported that a rich strike has been made at the Poverty Point mine.——A strike has been made at the Griffith Consolidated and a larger force will be put to work as soon as sufficient water can be secured.

Placerville *Republican*: Prospecting has been resumed on the Selby mine, owned by Larkin Bros. of Placerville. A portable engine and boiler has been taken to the mine to remove the water. Eastern people are doing the work.——The Toll House gravel mine at Smith's Flat, operated some years ago by W. P. Stanley and others, has been sold to Los Angeles people. Robt. Dodds is Supt., and they are getting ready to drift. S. P. Jewett, president of the company, is at the mine as manager.

Georgetown *Gazette*: The Darling mine is reported closed down for the want of more modern machinery to sink the shaft. Several men are at work pumping water from the shaft.——The Toll House mine, near Smith's Flat, has been sold to R. N. Bulla and others of Los Angeles for $60,000. W. L. Jewett of Los Angeles is in charge of the mine.

Kern.

The Star Oil Co. has been incorporated at Bakersfield by R. S. Elwood, J. M. Keith, J. J. Mack, C. Wible and G. G. Carter; capital stock, $500,000.

Randsburg *Miner*: U. C. Brotherson came into Randsburg recently from Goler with a nugget weighing 1 oz. 6 pwt. 20 grs. He and his partner disposed of one that returned them $80.

Bakersfield *Californian*: Several new water claims have been put on record within the last few days. Pumping from wells in Cuddeback lake, to furnish water for mining and milling purposes, is being considered.——A company has been incorporated under the laws of West Virginia by Boston parties to mine at Copper City, in this county. The capital stock is $2,500,000.——N. Hoff says that at the Slate range he has five tons on the dump of the Homestake that will mill $45 per ton.

Kings.

The Hanford-Cholame Oil Co. has been organized at Hanford by N. Weisbaum, R. Mills, J. Manasse, Hanford; J. W. Fisher, Parkfield, and J. Levy, Visalia; capital stock, $250,000.

Nevada.

The Lincoln G. & S. M. Co. has been incorporated at Grass Valley by T. R. Terrell, P. McAuslen, T. V. Snyder, T. R. Coughlin, Grass Valley, and F. Siehe, Sacramento.

The Keystone M. Co. has been organized at Grass Valley by H. A. Fairbanks, J. J. Hoskins, J. M. Thomas, W. D. Harris, Grass Valley, and J. H. English, Nevada City; capital stock, $25,000.

Grass Valley *Union*: The Murchie mine, northwest of Grass Valley, will in a few days be running full blast again. The property has lain idle since L. D. Blundell and his company suspended operations there over a year ago. The mine is leased to B. T. Vivian, E. Beedle, M. D. Morrison and W. B. Davis, who are miners. The shaft, which is about 250 feet deep, will be pumped out, the drifts retimbered and the mine put in shape. When the company quit they left considerable ground opened up. The property paid in former years, dividends having been declared when it was worked through the old 700-foot shaft. The ledge in the old works is the big blue lead, while in the new shaft the Cohoe vein is worked.

San Benito.

The Jose Copper M. Co. has been organized at Hollister by G. W. McConnell, R. Jose, J. Cofney, A. Johnson and N. C. Briggs; capital stock, $40,000.

San Bernardino.

Randsburg *Miner*: Twenty-three sacks of ore from a mine in the Slate range, owned by Mrs. Callahan, milled at the Black Hawk mill $180. More men have been put to work on the mine.

Plumas.

Quincy *Bulletin*: E. A. Halstead has interested San Jose capital in the purchase of the rights and privileges of the Elizabeth M. Co. to the mine on the Kellogg ranch, north of Quincy. Work has been resumed.

San Diego.

J. W. Rockford has been developing a quartz vein near Mesa Grande, in the vicinity of the Shenandoah mine, sinking a shaft nearly 100 feet deep. The mine has been bought by an Arizona man, who will operate it. The ores of this district are of good grade and free milling, occurring in mica schist.

Shasta.

(Special Correspondence).—Near Shasta work will be resumed soon on the Colorado and Gypsy mines by Howell & Turner.

In the Mitchel & Davis mine, upon which work was recently begun after long idleness, ore of fair grade has been found.

Coleman & Beall of New York are reopening the Cleveland Consolidated group of mines in the Bullychoop section. They have fifteen men at work. The tunnels aggregate 800 feet. Last week a large body of high-grade ore was discovered. The mill, concentrators and amalgamators started this week.

At the Mt. Shasta mine, near Redding, sinking is in progress for the 400 level and stoping continues at the 300. The ore is hauled nine miles to the Keswick smelter. It averages $47 a ton. The mine is producing $10,000 a month. This property has been in operation about one year, at the beginning of which it was taken up from an abandoned prospect. In the meantime it has produced about $100,000, of which one-half was profit. O. O. Howard of San Francisco is Pres. of the company and F. E. Ware is Gen. Mgr.

At the old Spanish mine, near Redding, of which L. F. Shepherd is Supt., a 32-foot gallows-frame has been erected and a 40 H. P. engine and boiler placed. The shaft is down 110 feet. The vein is 3 feet wide and is high-grade sulphuret ore.

Redding, Oct. 2nd, '99.

Shasta *Democrat*: On the property on Nigger hill known as the Nigger Hill group, owned by R. G. Dunn and D. W. Hall, Mr. Dunn has been sinking a double-compartment shaft down 100 feet. A drift is being run on the vein. At the bottom of the shaft the vein is 16 inches wide, solid ore and is very high grade. It is within half a mile of the Keswick smelter.——Supt. B. F. Iler of the Iler mine, three miles northwest of Keswick on a spur of Iron mountain, reports that recently a strike was made in the mine. The ledge is 10 feet wide and at the point of discovery the quartz is covered with gold. Nineteen men are at work in the mine.

Siskiyou.

It is reported that a large body of high-grade ore has been found at the Gold Ball mine on Salmon river. The Gold Ball adjoins the Black Bear mine.

A San Francisco company has bought the Blue Gravel mine at Yreka and begun work with a large force.

The Cherry Hill mill is idle for lack of water for use in the batteries. Ore is being taken from the mine and stacked for winter's work.

Yreka *Journal*: The Siskiyou Con. Quicksilver M. Co. has ten men prospecting at the head of West Beaver creek, Siskiyou mountain, developing ledges of cinnabar. It is proposed to rebuild the retorting works on a more extensive scale.——Parties have been negotiating for the Grater quartz mine on Horse creek, Klamath river, near Oak Bar, offering $10,000 for it, which Mr. Grater refused. He has a ledge 8 inches to 3 feet in thickness of high-grade ore.——Work is expected to be resumed at the Sheba mine on Patterson creek as soon as the air compressor is put in operation.——In the Cottonwood mining district, Doney Bros. are putting up a quartz mill. LaFlesh & Co., in the same section, are finding rich ore. Rich ore has lately been discovered on Old Craggy mountain at Humbug.

Yreka *Journal*: E. D. Baker is running the Gumboot mine at Scott river. The mill has been running four weeks and is fitted up with improved machinery. Thirty men are employed; part of them are building a road to Yreka.——The hands at the Greenhorn blue gravel mine quit last week and were paid off. The men went to dinner and supper half an hour before time—a rule carried out for some time. The new Supt., seeing a man go off at 11:30, asked the foreman where the man was going, and he replied: "To dinner." The Supt. then told him to dock him half an hour if he quit that early again for dinner, when the foreman also said he could dock him, too, and he would quit. The Supt. then told him: "All right; come around and get your money." The rest of the hands acted likewise.——The entire country on Squaw creek, a tributary of Willow creek, in the Gazelle district, and vicinity, has been located for mining claims. On Parks and Willow creeks good copper prospects have also been found.

Ætna *Advance*: C. Peregoy will open an asphalt ledge discovered on Craggy mountain, 3½ miles from Callahan's. He located two claims recently. The ledge is 6 feet wide.

Yreka *News*: J. S. Morley, who recently struck a good prospect, is developing it.——J. C. Otting has sold his quartz claim in Humbug district to J. J. Perkins.——E. D. Baker, Supt. Gumboot mine, has made improvements in the mill and will begin crushing the ore held in reserve.——M. A. Mitchell of Ashland, Or., has bought the quartz mine of C. H. Martin and J. Perkins for $2500. He expects to erect a mill.——The Commodore mine, under Supt. Wilkinson, continues to pay, and the mill will be enlarged to ten stamps. This is one of the best paying mines of its size in the county.——The Greenhorn blue gravel mine has been bought of Wetzel, Harmon & Ridenhour by Lezinsky, Page & Heard for the sum of $10,000. The new company has begun work.

Tuolumne.

An 80 H. P. engine has been installed at the Jumper mine near Stent, owing to the water famine that yearly occurs.

Most of the important mines of this county now have both water and steam plants, and some have also electricity. As the latter force is dependent upon the water supply, it is no more reliable than the water.

The Scott Bros., of the Black Oak mine, have made a strike in the Altamont claim near Soulsbyville, in a crosscut from the shaft. They are drifting on the vein.

Union-Democrat: At the Pauper's Dream, the west extension of the Longfellow, at Big Oak Flat, the shaft is down 300 feet, and fine ore is being found in both drifts at that level. The mine is under bond to a Boston company. J. M. Meighan is Supt.——Extensive forest fires are raging in the mountains of this and adjoining counties. Several mining companies have lost cordwood by these fires.

Sonora *Independent*: Stone & Ball, who are working the Hudson & Calhoun mine at Saw Mill Flat, have taken out several pockets of gold of late.——The mill at the Golden Gate mine, Sonora, is being run by steam power. ——At the Draper mine, near Soulsbyville, new machinery is being put in, including a skip, air compressor, etc., and machine drills will soon be in operation. When the sinking was discontinued, in order to erect the machinery, the vein in the bottom of the shaft showed free gold and was heavily mineralized. Two pumps discharge a 3-inch stream. G. F. Dyer is Supt.

Trinity.

Weaverville *Journal*: The Maple Creek M. Co., above Junction City, have done a large amount of work upon their property and will be equipped December 1st. Two and one-half miles of new ditch are completed, which will take water from Dutch creek. It is 6½ feet wide on top, 4 feet wide on the bottom and 30

inches deep, with a grade of 9.60 feet to the mile. One hundred and fifty men are employed. The company is putting in a saw mill to supply lumber. The pipe for the mine is on the ground. Supt. F. Hall has charge of the property. When the season is opened three giants will be in use.

COLORADO.

Considerable talk is heard from various sources to the effect that the American Smelting & Refining Co. are gradually withdrawing their business from the samplers, with the ultimate intention of forcing them out of business; that the big smelting company seeks to deal directly with the miners, to the exclusion of the samplers. Inquiry among the various samplers, however, does not afford a substantiation of the statement. The latter claim that, while it is natural for the smelters to deal directly with the larger producers, there is no likelihood of the public samplers ceasing to become a factor in the State, as their operations are a convenience and a benefit to both smelters and mines, by their readiness to handle the product of the small and medium mines.

ARAPAHOE COUNTY.

(Special Correspondence). — The Denver Smelting & Mining Co., said to have been organized by the members of the Kilton Sampling Co., are to erect a pyritic smelter at Denver, of which the Kilton sampling and ore purchasing plants will become feeders.

Denver, Sept. 28th, '99.

BOULDER COUNTY.

The Ingram mine, one of the steady shippers of the county, has been equipped with new machinery and, is now shipping from seven to eight cars of ore per day to the Kilton Works at Boulder.

The Melvina mine is again being operated by J. A. Harriman, Jr., of Boston, Mass., with J. J. Harris as Mgr. The work is being confined to development, with a view to its purchase.

The Marchioness tunnel is now in 300 feet, and machinery has been ordered to work with air drills.

The Scotia mine, at Gold Hill, is shipping two or three cars per day to the Culbertson mill.

The ten amalgamating plates of the Madeline mill, at Ward, were stolen recently. They are several years old and contain much gold.

M. F. Leech, Pres. Manila Mining & Investment Co. of Boulder, has bought for his company the right to use the pneumatic cyanide process in this county, and will begin the erection of a large custom mill in Boulder.

CHAFFEE COUNTY.

(Special Correspondence).—B. T. Brooks, under whose directions the Sedalia copper mine is operating, is reopening the Columbus mine in the Monarch district. The Columbus produces gold, silver and lead.

Sedalia, Sept. 29th, '99.

CLEAR CREEK COUNTY.

Georgetown *Courier*: The 700-foot level on the Allunde mine, being driven to explore the ore encountered in the 850 level, broke into the ore last week. It consists of an intimate mixture of ruby silver, gray copper and galena.——The Progressive Eight Co. have opened a vein of ore 120 feet in the Pueblo lode, on Griffith mountain. The ore is 4 to 10 inches in thickness, and a mill run returned 3¼ ounces gold and 16 ounces silver per ton.——Mr. Montgomery has men employed on the Scepter tunnel of the Astor mines. The Astor was a producer twenty years ago.

CUSTER COUNTY.

The Bassick mine is being unwatered and retimbered for resumption of production. There was 800 feet of water in the mine, and there has been much caving of drifts. At Lake creek, fifteen miles northwest of Silver Cliff, one of the copper mines is putting in a $20,000 plant.

The Geyser, at Silver Cliff, has an 8-foot vein of copper ore at the 2600 level. It has a concentrator and is ready to handle the ore as soon as it is brought out.

The Bull Domingo is reported sold to an Eastern syndicate, and it is also reported that a new hoisting plant will be erected. The old hoist was destroyed by fire a year ago. The Bull Domingo has a concentrating mill.

FREMONT COUNTY.

R. C. & W. M. Wilson, who have been working the Gray Eagle claim on Four-mile creek, at the foot of Sheep mountain, at a depth of 306 feet have a body of sylvanite ore that runs $196 to the ton.

GILPIN COUNTY.

It is reported that the Topeka has been sold for $400,000.——Russell Gulch parties on the West Calhoun are taking out mill and smelting ore and shipping. On the same hill is the French claim, owned by Judge Wells and W. Teller of Denver. Sixteen men are working in the main shaft, under a sub-lease, taking out only smelting ore, which markets at $70 to $85 per ton. A new shaft is being sunk 400 feet west of the old one.

The Central City mine is to have a new hoist. It is being worked by the Ross M. Co.

The California mine has a new 2200-foot steel rope on the reel of the hoist.

GUNNISON COUNTY.

The Lucky Strike mine at Chance has resumed work after five years of litigation.

J. H. McCormick has opened up pay ore in the Wahl mine, in the Tin Cup district, and is packing a carload to the railroad at Ohio City. The ore runs well in gold, much of it being free.

The Cortland M. Co. of McIntyre gulch, near Ohio city, is shipping ore that nets $1500 per car.

Pitkin *Miner*: R. W. Spensley, Supt. Union Park placer, has thirty men employed. They have 2700 feet of flume in place and have 1400 feet to put in before reaching the point where they begin washing gravel.

Pitkin *Miner*: The Granite Mountain mine is located in Jones' gulch, in the Gold Brick district and is being operated by the Pittsburg-Gunnison M. & M. Co. In development, 200 tons of mill ore have been taken out which will run from $12 to $40, and the company expects to erect a mill next spring.——The Perigo mine in Telurium gulch is working a large force and putting in a new air compressor and other machinery.——The Galena King is being worked under bond and lease by Olsen, Muller & Hunn of Aspen. They are now in 260 feet with crosscut tunnel.

HINSDALE COUNTY.

(Special Correspondence).—The 50-ton concentration mill of the Golden Fleece is almost complete. It will start up in October. It is equipped with crushers, rolls, jigs and concentrating tables. Supt. G. W. Pierce states that medium grade ore, of which they have one year's supply, will be milled. The high-grade ore will be shipped to the smelters, as heretofore.

The Hidden Treasure is milling 100 tons per day, the product being about twenty tons of concentrates. From 400 to 500 tons per month of concentrates and high-grade ore are shipped to the smelters.

New machinery is being put in at the Lellie, up Henson creek. WASCOTT.

Lake City, Colo., Sept, 26th, '99.

LAKE COUNTY.

(Special Correspondence).— The properties of the Iron Silver M. Co. are shipping from the Moyer shaft 200 tons per day, which consists of sulphides carrying gold, silver and zinc blende. The last-named material is shipped to Belgium. This company is remodeling the old mill in California gulch for concentration.

The old Elgin smelter has been purchased by the Boston G. & C. Co., who are equipping it for pyritic work. The plant will soon be started up. WASCOTT.

Leadville, Colo., Sept. 26th, '99.

Native copper has been found in Ruby No. 1, on Red mountain, Twin Lakes district. The ore was struck at 16 feet, and assays $250 in gold, silver, copper and lead.

A 10-inch streak of ore has been opened in the breast of the Gold Hill tunnel, Twin Lakes district, which assays from one to six ounces gold, five to ten ounces silver and 15% lead.

The daily shipments from Leadville mines average nearly 2000 tons.

Prominent miners of the Leadville district are talking of reviving the scheme to drive the tunnel from Malta, for which surveys were made several years ago.

The Twin Lakes M. Co., a London corporation, owning the Cache Creek placers, has been reorganized and more capital secured.

Leadville *Miner*: C. E. Osgood, Mgr. of the Sixth Street mine, is considering the purchase of residence property for additional dumping room. The west shaft can be put in shape for a cage and sunk to the Penrose level. Large bodies of iron, 100 feet thick and still going down, are known to exist. The steel-iron formerly netted $3 per ton for manganese contents, while the smelting iron carries 18 ounces silver and 54% excess.——H. Schrader has teams hauling lead ore from the Continental Chief mine, located above timber line at the head of Iowa pass.——G. Germon & Co. have recently taken the lease on the Four Per Cent and Cady mines, on Fryer hill, from Ovens & Harvey. They are also working the North Side and Buckeye shafts. In these workings are fine stopes of iron carrying from 4 to 8 ounces silver and from 42% to 52% iron excess. They also have a small streak of very rich lead ore, assaying high in silver. Sixteen men are employed.

Denver *Republican*: When the Home M. Co., composed largely of Leadville merchants, was formed, it seemed as if there was no hope of resumption in the down-town territorry, which had been drowned out since the blowing up of the Coronado mine in 1896. The large operators in the district had been offered substantial inducements in the way of leases on virgin ground of prospective value, but would do nothing. The future of the camp looked unpromising. A home company was finally decided upon, and after months of work the company was organized and operations commenced. The accident at the Bon Air shaft added more than $20,000 to the expense, and delayed the completion of the work more than two months. The original $50,000 deemed necessary to drain the mines was swelled to more than $100,000. The Home M. Co., if now reaping its reward. It has unwatered the ground, and a number of the best mines in the camp are once more in production. The water is handled easily and at comparatively light expense. Most of the mines affected have been repaired and are giving employment to more than 500 men. The tonnage is increasing and the company finds itself in possession of property worth a great deal more than the amount of its capital stock. The company is working through three shafts and hoisting fifty tons of ore per day, that carries from 70 to 100 ounces of silver per ton and about 170 tons of iron, carrying more than 70% excess of iron and a little silver. More than 100 men are employed by the company in addition to those employed by older mines, and the company organized for the relief of the camp from the strained situation of a year ago now finds that it has added a new enterprise to the camp and is making money for its stockholders.

OURAY COUNTY.

L. Summers and two partners, while prospecting for silver near Ironton, recently struck a large vein of uranium.

Denver *Republican*: The Treasury Tunnel & Reduction Co. has commenced the development of claims in the Red Mountain district and proposes to drive a tunnel 3000 feet. The tunnel is in 120 feet by hand and an air plant is to be installed. The workings are to be connected with the Silverton railroad by a spur a mile and a half long. Forty men are employed.——Recent developments on the Silver Queen, Bear creek, has exposed a 3-foot vein of high-grade silver ore.——The Bimetallist, Sneffels district, after exhausting the high-grade ore worked last year, has been driving for an extension of the same vein and last week struck it in the Hawkeye claim, the ore being high grade in gold.

RIO BLANCO COUNTY.

It is reported that J. Leiter, Jr., of Chicago is negotiating for the gilsonite fields of Colorado, lying next the Utah line. The vein of gilsonite that is the object of the pending negotiations is the only one of the Utah veins that crosses the Colorado line. There are three large veins in the Uncompagre Indian reservation, but this in Colorado is the only one open to location. It has been secured by Mr. Seiboldt and others. The material is the purest natural asphaltum known. The residue after combustion is very small and is one of the most valuable deposits of asphalt in the country, the only other approaching it in value being the deposit in an angle between the Uintah and Uncompahgre Indian agencies.

SUMMIT COUNTY.

The Duncan mine, which is being operated under bond and lease by C. Gallagher, has recently opened a body of ore carrying 45% to 65% lead and from half an ounce to an ounce and a half in gold. Forty to fifty tons per month are being shipped.

The Extension on Gibson hill is taking out forty tons per day of milling ore, supplying a 20-stamp mill.

The Eastern company which recently secured a bond and lease on the Hazel group in Cucumber gulch will prospect that locality by Diamond drill. The work is in charge of F. C. Alsdorf of Telluride.

Denver *Republican*: The Ella, on Mineral hill, at Breckenridge, has for some time shipped seventy-five tons of high-grade lead to the local sampler per month with seven men.——Breckenridge is now an eight-hour camp, as regards lode mines. The Breckenridge district is showing activity and the camp was never more prosperous.——At the Jackson placer the new people, through Mr. Revett, have had a large force at work the past three weeks, cleaning out ditches, diverting the Blue and getting in shape for work. This is almost completed.——The drill used in prospecting the ground on the Swan has been brought up to the Jackson placer and the property will be tested. By this method holes are bored to bedrock and the gravel washed.

TELLER COUNTY.

The gold output of the Cripple Creek district during September amounted to $1,731,000, surpassing all previous records. The production of gold in this district from the time of its discovery in 1891 to date is $62,057,292. September's output was as follows:

	Tons.	Per Ton.	Value.
Colorado City	8,500	$35	$297,500
Arequa	2,000	20	40,000
National, Florence	1,750	30	52,500
El Paso, Florence	4,000	32	128,000
Metallic, Florence	8,500	20	170,000
Smelting ore	11,000	93	1,023,000
Miscellaneons	....	..	20,000
Total			$1,731,000

Mining Reporter: Another strike has been made on the Gold Sovereign at Cripple Creek in the new level at the bottom of the Whisper shaft at a depth of 380 feet. The vein is 4 feet wide and 18 inches of it is high grade. At the Gold Sovereign heavy production is being made.——A discovery has been made on the surface of the Hoosier Boy, on the south slope of Beacon hill. On the north end of the claim a vein said to be the extension of the Black Belle lead has been cut and traced for a distance of 700 feet through Hoosier Boy ground. The assays return 3.58 ounces gold.

Cripple Creek *Times*: A strike has been made in the granite, in the city of Victor, the Mary Cashen Leasing Co. working the Mt. Rosa having found a 4-foot vein at a depth of 500 feet in a crosscut close to the shaft. Assays show 100 ounces gold to the ton. The vein matter is silicified granite, the same as is found in the Strong and the Gold Coin. The leasing company has been working twenty months and are getting their first ore. The strike proves that the ground between the Gold Coin and the Strong is not barren.

Cripple Creek *Times*: The Herrington lease on the Little Pedro has encountered pay ore 10 feet from the surface.——I. Barber has completed the erection of a shafthouse on the Cumberland, on Republic hill. A vein 3½ feet wide shows values of $12 a ton.——The Humboldt Co. started work on the Grouse claim, on Ironclad hill. The shaft is down 60 feet, and a contract has been let to sink 90 feet. Machinery has lately been installed.——On the Olive Branch nine sets of lessees are working.——A strike is reported in the Clara D of the Lexington Co. It is stated that the strike was made in the breast of the 225-foot level, and that the values across the 14-inch vein run $500 to the ton.

IDAHO.

ADA COUNTY.

The business done at the United States assay office at Boise during the month of September amounted to $202,526, against $131,894 for September, 1898, an increase of $70,631, or nearly 50%. For the quarter ending September 30th the total was $683,936.

IDAHO COUNTY.

It is reported that a discovery of a large and rich gold ledge has been made in the Summit mine, in the vicinity of Black lake. Development work was being done, when a 30-foot vein of free-milling ore was encountered. Pack trains are taking in provisions and mining supplies. The mine on which this ledge was struck is owned by Ford Bros., who have several claims in the vicinity and also a gold mine in Placer Basin.

Spokesman-Review: It is reported that Clark & Sweeny have given up their bonds on the Cracker Jack and Jumbo claims, in the Buffalo Hump camp, and it has been stated that the firm would withdraw from that camp; Mr. Sweeny is quoted as saying that he has confidence in that camp and expects to open there. He has bonded the Vesuvius group and has it under operation.——M. W. Musgrove is Mgr. of the company which is driving a tunnel through the Buffalo Hump mountain. The face shows stringers of quartz; but 60 feet remains to tap the first vein—that which crops on the Orizaba claim, which the company owns. The tunnel will tap other veins than those showing on the company's property. A four-drill compressor with equipment has been ordered, and the tunnel will be advanced with two machine drills. The Hump carries a network of veins and the tunnel will drain most of them.

Weiser *Signal*: Gabbart & Stewart of Spokane have bought the Silver King mine, near Warren, one of the oldest mines in the camp, which has always been known as a silver vein and on which a tunnel was run years ago and a rich chute of silver ore stoped to the surface. Messrs Gabbart and Stewart discovered that the hanging wall of the old workings was a parallel chute of $50 gold ore; they discovered that the pile of quartz boulders piled up around the end stake of the claim were rich in gold which had for years escaped the notice of those working the mine. They prospected the old claim and found it to be a bonanza.

Lewiston *Tribune*: The Myrtle group of copper mines on Snake river, eighteen miles above Imnaha, have recently been sold by Dr. Bibby and John O'Neill of Grangeville to Boston parties for $100,000, of which $5000 was cash, 10% on October 30, 10% on November 30 and the balance on December 30. There are eight claims in the group and except on one property nothing has been done beyond assessment work. On the Myrtle there is an 18-foot cut with 10 feet of ore in the face. There are sixty tons on the dump. It averages 10% copper, $20 in gold and six ounces in silver. It is copper ore in trap, occurring in ribbons of 2 to 4 feet for 180 feet across the claim, one wall of which has not yet been found.

KOOTENAY COUNTY.

(Special Correspondence).—The Keep Cool M. Co. are developing a group of four claims near Lakeview, under direction of W. H. Fawcett. An ore shoot stoped some years ago near the surface yielded $20,000, the ore being rich in lead, silver and gold. The ore in sight having been exhausted, the project was abandoned by the operator, and subsequently came into the hands of the company now working it. The old workings were cleaned out and intelligent prospecting has rediscovered the old ore shoot. The vein in which the high-grade ore occurs is from 1 foot to 5 feet in width, carrying steel galena and gray copper, rich in silver and gold. The main vein is from 50 to 70 feet wide, consisting of a mineralized zone in porphyry at a slate contact. The values are stated to be from $12 to $20 per ton, but the Supt. is following the high-grade shipping ore, with a view to making the property self-sustaining. The new ore shoot recently cut by a crosscut tunnel runs $200 per ton.

Lakeview, Oct. 1st, '99.

OWYHEE COUNTY.

Silver City *Avalanche*: The Gold Rock M. Co., operating the Mammoth in Blue gulch, has run a 750-foot crosscut, cutting four separate veins from 4 to 35 feet in width, and is drifting south on the Mammoth ledge 150 feet from the crosscut. A large order for rails, air pipe and other supplies has been placed, and work will be resumed on the crosscut tunnel. The company has bonded the Combination and Golden claims, adjoining. New buildings will be erected and an exhaust fan put in for ventilation.——The recent mill run from the Ontario of forty-four and three-tenths tons of ore yielded $5400 in bullion.——Mgr. Jenkins of the Cumberland is adding to his force and preparing for a mill.

SHOSHONE COUNTY.

A few days ago a strike of gold quartz was made near the headwaters of the St. Joe river, thirty-five miles from Salmon, by Green and Seeley. The ledge is 20 to 30 feet wide, and crops out for several hundred feet. There have been several locations made. A large number of men are rushing there from local points. Assays on samples run from $5.80 to $24 in gold.

MICHIGAN.

HOUGHTON COUNTY.

Sixteen copper mines are assessed for taxation at $149,300,000; the county is assessed at $42,500,000.

MISSOURI.

JASPER COUNTY.

Ninety per cent of the zinc producers in this district have shut down in the compliance with an order from the Missouri & Kansas Zinc Miners' Association in an effort to force the smelters to pay a schedule of prices laid down by the association a few weeks since, and which the smelters have thus far refused to accede to. At Webb City alone 1500 miners will be thrown out of work temporarily.

MONTANA.

RAVALLI COUNTY.

Work has been temporarily suspended on the Monitor mine on Mineral Hill, owning to the great amount of water in the shaft, which could not be handled with a windlass. The ledge, has developed into a large body of high-grade ore, and a pump, engine and hoist will be put up and a large force employed during the winter to prospect the claim.

The Mineral Hill mining district, comprises an area of over fifty square miles and i

covered with veins, bearing gold, silver, copper and lead. Hundreds of locations were made in the district ten years ago, but after a few representations they were abandoned, owing to the fact that the district is 100 miles from the railway and could be reached only by trail that was almost impassable the greater part of the year. This difficulty has now been overcome by the construction of a wagon road. Many new locations are being made and a concentrator is to be built at the Monitor, next season.

Butte capitalists recently took an option on the property of the Ward Placer M. Co. on Hughes creek and are prospecting the bars on the lower course of the creek. If the option is taken up they propose to put on dredging machinery.

In an eight days' run on the Canyon placer claim on Hughes creek, with six men, over 40 ounces of coarse gold were recently taken out.

FERGUS COUNTY.

At Lewistown the Great Northern Mining & Development Company has completed a $75,000 mill and cyanide plant and a similar plant is being erected by Johnson & Wright on the New Year group. The first named company owns the Gilt Edge property and both companies have large veins of low-grade refractory gold ore. The Spotted Horse mine, which has lain idle for months, is to be reopened by the owner, J. O. Bright of Columbus, O.

NEVADA.

ESMERALDA COUNTY.

Miller & Bacigalupi, who are working a mine near the Big Indian, have ore ready for shipment which will mill $40 per ton.

Hawthorne *Bulletin*: The Lee brothers at Huntoon have five tons of ore that will mill $300 per ton ready for shipment to Stewart's mill at Soda, besides this forty tons of ore on the dump that will mill $40 per ton. This ore will not bear the cost of transportation, and will be held until milling facilities are provided at the mine. They are tunneling to tap the ledge at a depth of 100 feet. The country is mineralized, and a large number of locations have been made the past month. The ledges are large and contain gold, lead and silver.

HUMBOLDT COUNTY.

Work is to be renewed in the Adelaide copper mines at Golconda.

STOREY COUNTY.

At the C. & C. shaft, Comstock lode, No. 2 elevator has been replaced during the week and is again at work. Following is the latest official dispatch:

VIRGINIA, Nev., Oct. 5, 1899.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco:—No. 2 elevator ran 17 hours and 35 minutes. At 6:30 this morning the water was 32 feet 2 inches below the 1950-foot level station. JOS. R. RYAN.

The water raised 1 foot 10 inches during the past twenty-four hours.

NEW MEXICO.

DONNA ANA COUNTY.

Colonel Henderson has men at work in the old Stephenson mine at Organ. The Stepenson was the first mine patented in New Mexico in 1871, and was then known as the St. Augustine.

OREGON.

BAKER COUNTY.

(Special Correspondence.)—F. R. Mellis of the Baker City Mining Exchange has shipped to the Spokane Exhibition that opens October 3rd, six tons of gold ore contributed by the various mines in the vicinity of Baker City. It is estimated that the six tons if worked by mill process would yield $25,000.

P. E. Poindexter of Sumpter, is also making a fine exhibit at the Spokane Fair taken from twenty-five different mines, embracing over ten tons of gold ore.

James Arthur of Cornucopia has a deal with Baker City men for 1100 acres rich quartz claims in the Virtue district.

Baker City, Oct. 1st, '99.

Sumpter *American*: The Climax mine, near the Columbia, is to be worked. It is owned by G. W. Grayson of San Francisco, who formerly owned the Virtue and Collateral mines near Baker. The development is in charge of Daniels & Boorman. The mine has two tunnels, the lower one being 600 feet long and striking the 18-foot ledge 200 feet below the surface, cutting ore said to run $9 to the ton. This property was sold to Mr. Grayson three years ago by Warren Cable, but has been shut down one year.

Baker City *Republican*: A newly discovered mining district, thirty miles south of Baker City, on the divide between Burnt and Powder rivers, has been opened by W. Eblen, J. Toynton and N. Hall, who have located four claims, which they call the Black Jack group, and have sunk a 25-foot shaft, which cuts through the ledge whithout any sign of either wall. The ore assays $25 per ton.

JACKSON COUNTY.

Ashland *Record*: At the Golden Standard, ore has been discovered which resembles the Gold Hill quartz. The vein is 8 inches thick, with walls of slate and porphyry. One rich deposit follows another, with high-grade between.——Another discovery like the Golden Standard is reported on Horse creek, south of the Big Applegate. C. Grater was the discoverer.

UTAH.

The output of auro-cyanides for the month of September from the various mills amounted to about 14,000 pounds.

BEAVER COUNTY.

The Blackbird Copper M. Co., whose property is in Copper gulch, have ore in their shaft at a depth of 135 feet. The ore is copper sulphide, carrying good gold and silver values. An assay returned 25% copper, $7 gold and thirty-one ounces silver.

BOX ELDER COUNTY.

Salt Lake *Tribune*: Of the Copper mountain group purchased by Lewisshon Bros. last spring for $140,000, Manager Tuttle says the result of development has been satisfactory, and that thirty miners are blocking out ores. The idea of erecting furnaces on the ground has been abandoned, and instead, a mill will be provided for the treatment of them, near Salt Lake.

IRON COUNTY.

Salt Lake *Tribune*: An ore shipment from the Johnnie is ready. Mgr. C. O. Newell says this is first-class ore and expects returns netting $2000 per ton. The ledge has increased in width until at 75 feet they are sinking in solid ore. Everything taken out will be put through the mill, which is soon to be started.——The Burro, which has reached a depth of 180 feet, is looking fine and a change has taken place in the ore, as it carries as much gold as silver.

JUAB COUNTY.

The ore shipments the past week from Tintic were as follows:

Mine.	*Cars.*
Bullion-Beck	10
Gemini	6
Centennial Eureka	17
Uncle Sam and Humbug	5
Grand Central	9
Mammoth	10
Swansea	6
South Swansea	2
Dragon Iron mine	14
Rabbit's Foot	1
Sunbeam (Woodmansee lease)	1
Total	91
Sioux mill, bars of bullion	2
Mammoth mill, bars of bullion	2
Total	4
Mammoth mill, cars of concentrates	3

SALT LAKE COUNTY.

Recent assays on samples taken from the new ore body in the Bingham copper and gold ground gave a general average of fifty-eight ounces silver, 32% copper and $39 in gold, with a market value of $168 per ton. The ore is dark, with an antimonial luster. This shoot is believed to be independent of the one opened above.

SUMMIT COUNTY.

Preparations for the $2,000,000 damage suit between the Crown Point and Ontario and Daly, and in which the Crown Point seeks to recover that amount for ores the defendants are accused of taking from its ground, have begun. The disputed territory has been examined by M. K. Harkness, A. Bemis and Messrs. Palmer and Keyes for the defendant companies. It is said that defendants would not deny having gone beyond their lines, but would justify their action under the law of apex.

TOOELE COUNTY.

Tribune: Preparation are again being made for milling Sunshine ores.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The recent strike made by Otto Grautz on the Hidden Fortune mine, on the divide between the Homestake properties and Poorman gulch, is in the quartzite lying at the base of the Cambrian, and overlying the Archæan, in which the Homestake ore deposits are found. The rock on its exterior surface often gives no indication of its value, but on being broken coarse and fine gold is discovered in quantity. The fact that all originally overlying formation has been eroded makes the mining of this shoot of ore inexpensive. It is not unlikely that similar shoots of ore carrying pay values will be found both east and west of the Grautz find, as the lower quartzite is found on some of the neighboring hills as remnants of a once co-extensive formation.

Deadwood *Independent*: In Lawrence county the Homestake mills on an average crush 3000 tons, valued at $15,000, every twenty-four hours; the Golden Reward, 600 tons, valued at $10,000; the Klidonan, 150 tons, valued at approximately $3000. Other mines, including Portland, Squaw Creek, Strawberry, Blacktail, Garden City, Uncle Sam, Ragged Top and Galena, the available ore will approximate 900 tons daily, valued at $12,000, the daily production being approximately 4650 tons, valued at $40,000.

WASHINGTON.

FERRY COUNTY.

Samples from the richer portion of the Republic ledge at the bottom of the 50-foot winze being sunk from the 400 level assay $4744.

The Surprise is drifting on 5 feet of solid ore, which assays $58 per ton. Recent assays across the face of this drift run as high as $465.

WYOMING.

CARBON COUNTY.

W. F. Cody (Buffalo Bill) is at the head of a company incorporating to build a smelter at Grand Encampment. The project is capitalized at $500,000.

FOREIGN.

AUSTRALIA.

Mining operations are being pursued with great activity at Broken Hill, owing to the better prices the different metals are bringing. Many of the small copper, lead, silver, zinc and tin mines in the district are resuming work, and the large lead and silver mines are in good ore and working full time. There is a scarcity of miners. Twice as many men could find employment. The Proprietary mine alone wants 400 additional men. The Broken Hill Consols mine is raising fine silver.

BRITISH COLUMBIA.

A strike has been made in Deadwood camp on the Primrose, the southern extension of the Mother Lode. The cutting of the spur line of the C. P. R. into the Mother Lode exposed a vein of yellow copper 37 feet wide. It is on the vein of the Mother Lode. P. Johnson is Supt. of the company. Work on the smelter has begun. For a week or two there was a delay, owing to some land required for a dump.

A 5-stamp mill at the Camp McKinney Mines, Ltd., in sixty-three days turned out twelve gold bricks, worth $5940. Five stamps are to be added to the mill.

A large deposit of coal has been discovered on the opposite side of Elk river from Fernie. It is said to be as good as the coal mined by the Crow's Nest Coal Co.

Spokesman Review: The output for Rossland camp for the week ending September 30th was 4586 tons, shipped as follows: Trail smelter, 2520 tons; Northport smelter, 2005 tons; B. C. Bullion Extraction Co., Silica, 61 tons. The I. X. L. mine, on O. K. mountain, joins the list of shippers sending out twenty-five tons.

The statement of shipments during the week and for the year to date is as follows:

	Week. Tons.	*Year. Tons.*
Le Roi	1920	66,440.00
War Eagle	1831	41,739 50
Iron Mask	150	3,510.00
Evening Star	60	968.50
Deer Park		18.00
Center Star	600	6,757.00
Columbia-Kootenay		111.50
Virginia		40.00
Mountain Trail		20.00
I. X. L.	25	25.00
Totals	4586	119,629.50

After a recent examination, a mining engineer who inspected the I X L property stated that there are 4000 tons of $20 ore now in sight in the mine. Twenty-five tons were shipped to the Northport Smelter recently. The management intend to commence regular shipments.

A large number of drills have been ordered by the Le Roi and War Eagle. The former placed an order for twenty-five drills and the latter for twenty-four.

New Denver *Ledge*: Some time ago the Miners' Union at Silverton passed a resolution declaring that members should not do work by contract. This forced the men on the Bosun and Wakefield to quit work. Last week the Union reconsidered the question and finally withdrew the resolution thus permitting the men to accept contracts in the lake properties. This action is understood to be a compromise.

CANADA.

American Manufacturer: The recently discovered Algoma iron range is 100 miles from Sault Ste. Marie on the north shore of Lake Superior, in the province of Ontario. The district is known as the Michipicoten district. The results of explorations indicate a width of sixteen miles. The bulk of the iron ore discovered so far lies in a U-shaped basin about the northeast side of Lake Boyer, which is ten miles inland from Lake Superior and stands at considerable elevation above the latter. A ridge of jasper lies along the foot side of the formation for two miles or more, and it is against this jasper that the ore lies. To the north the jasper disappears and its place is taken by a ridge of iron sulphide. All of the ore found so far occurs at the break near Lake Boyer, where the sulphide gives place to the jasper. Here a tongue of land protrudes from the east shore towards the middle of the lake about one-half mile. Upon this tongue is a deposit of brown hematite ore estimated to contain 600,000 tons, with nothing covering it but moss. Samples of the ore were found to be 60% Bessemer, close to the limit. The Minnesota Iron Co. has bought a harbor, and a railroad is being built to the iron lands. At present 200 men are at work grading the road.

LOWER CALIFORNIA.

San Diego *Union*: L. A. Wright of San Diego has returned from the Republica gold mine in La Huerta district, of which he is general manager. The 10-stamp mill at Republica has made its first run. The concentrates were richer than anticipated. A tunnel, now in 350 feet, is being extended. A saw mill is running and furnishing lumber for Alamo, forty miles away. Times are good at Alamo and every available man is at work in and about the mines. Maj. Russell is doing well in the Aurora mine. He recently made a good strike.

Yuma *Sentinel*: G. Simon has been on a prospecting trip in the Cocopah mountains, and exhibits a piece of ore rich in gold which he says is from a 4-foot ledge. The rock is free milling.

MEXICO.

The Parral Reduction Co., with $100,000 capital stock, will construct a smelter in the State of Chihuahua. It will have an office in Denver, Colo. The incorporators are B. Gilpin, Jr., J. F. Hopkins and A. B. Seaman.

In La Dura mine, in Morales district, Chihuahua, the ore carries high values in gold and silver. Gold is visible in most of it, but is of light color, owing to its being alloyed with silver. In the same ore may be observed a large amount of black sulphide of silver. The mine is well named, for the rock is extremely hard. Some work was done on it some years ago by an American company.

Mgr. McDonald of the Guanajuato M. Co. reports that the mill is saving 81% of the gold in the low-grade ore, and 91% is expected to be saved from the high-grade, which is considered a satisfactory saving in the first running of a combination gold-silver mill of the Boss type.

Two Republics: J. H. McKim, formerly of the Roi mine, in the Pilares district, Sonora, has returned to Missouri, having made a fortune by mining. He proposes to organize a company to work gold properties in the California Gulch district, Sonora.——A new discovery is reported from the Moctezuma district, Sonora, of a free milling gold vein near the Victoria, upon which work has recently been begun. The new vein was found by a Bisbee miner named Johnson.——The owners of the Seven Stars mine, in the Guaynopa district, southwest of Casas Grandes, will begin shipments of ore.——Representatives of the Pacific coast smelters have been recently visiting the mining districts of northern Sonora, and contracts have been closed for heavy shipments of ore.

NEW ZEALAND.

A bar of gold, 39½ oz. in weight, was taken to Invercargill from the Undaunted G. M. Co.'s property at Orepuki. Seventy-three and one-fourth yards of wash were put through to obtain this, the return thus giving an average of over one-half oz. to the yard.

The number of miners employed in alluvial workings, hydraulic sluicing and dredging in New Zealand during the past year was 8951; in quartz mining, 4721; and in coal mining, 2003; total, 15,675. The number of fatal accidents was twenty-two, or at the rate of 1.6 per 1000.

SOUTH AFRICA.

The Government has issued a notice of the measure to be observed in the event of war. The mines may continue working, reasonable protection being afforded. The liquor trade is prohibited, and special police will maintain order. The Rand gold produced during the war is to be deposited with the Government, who will mint therefrom sufficient to pay its working expenses. The rest will be returned after the war. Strict passport regulations have also been provided.

A press dispatch from Pretoria says the Transvaal Government has seized gold valued at £800,000, which is now lodged in the State mint. The Government, the dispatch adds, will indemnify the banks to which the gold is consigned.

South African *Mining Journal*: At the New Primrose, the report for July is as follows: 160 stamps ran twenty-eight days, three hours and thirty minutes, crushing 23,228 tons of ore, yielding 6,354.70 ounces of smelted gold, at a cost of 19,568l 7s 11d for milling, mining and general charges, including development, or 16s 10.18d per ton milled. Cyanide:—15,400 tons of tailings treated yielded 4,407 ounces smelted gold; cost, 2,847l 0s 4d, or 2s 5.42d per ton milled. Financial.—The total cost of working for the month has been 22,415l 8s 3d. Profit for month, 16,073l 6s 11d.—On the Witwatersrand, the question of white mining labor is becoming acute. There is a steady stream of skilled underground workers making its way out of the country. Already, most of the principal mines are handicapped by lack of sufficient machine-drillers, and there can be little doubt but that a large number of men, whose term of contract expires at the end of the month, will refuse to re-engage themselves.

TASMANIA.

London *Mining Journal*: The yield of the Lyell field is steadily increasing, owing mainly to the impetus given by the high prices for copper and other metals. A rough calculation shows that the market value of the thirty-seven listed companies located at Lyell is close on £5,250,000, of which the Mount Lyell Co. absorbs £3,475,000, and the North Mount Lyell £1,650,000.

Commercial Paragraphs.

BAKER & HAMILTON, San Francisco, Sacramento and Los Angeles, furnish complete refrigerating machines of any required capacity.

THE Vulcan Iron Works Co. of Seattle, Wash., have shipped to the Golden Thread, Weatherby, Or., a 5-stamp mill, hoisting and pumping plant.

THE Gillette-Herzog Manufacturing Co. are putting up steel buildings at Bland, N. M., for doubling the capacity of the cyanide plant of the Albemarle M. Co.

ON the 27th ult. the exercises of the Massachusetts Institute of Technology began. Alvan L. Davis, S.B., and F. L. H. Kimball, S.B., are now assistants in mining engineering.

AT Pentz, Butte county, Cal., the Risdon Iron Works of San Francisco has put in an elevator capable of handling 2700 cubic yards of gravel every twenty-four hours in the work of working a body of tailings three miles long and 500 yards wide from the Spring Valley hydraulic mine at Cherokee. About 2250 feet of 16-inch pipe has been put in. The black sand, which will average $300 per ton, will be sent to the Selby Smelting & Lead Co.

Catalogues Received.

THE Hendrie & Bolthoff Manufacturing & Supply Co., Denver, Colo., have issued an attractive booklet, in which they describe and illustrate their special line of hoisting engines, from the small prospecting type to the heavy double-drum, high-speed hoist for deep mines. Each type of hoist is represented by a clear-cut engraving, showing those operated by steam, electricity or gasoline.

Recently Declared Mining Dividends.

Bunker Hill & Sullivan M. & C. Co., Idaho, $21,000; Oct. 4.

Parrott M. Co., Butte, Mont., $1.50 per share; payable Oct. 12.

Mammoth, Utah, $40,000; Oct. 4.

Swansea, Utah, $5000; payable Oct. 10. Total to date, $185,000.

Industrial Notes.

—Marysville, Cal., is building an artificial ice plant.

—Dawson, N. W. T., has telegraphic communication.

—Salt Lake, Butte and Anaconda now have telephonic connection.

—Orders are more plentiful than material to fill them with at present.

—Water and scrap iron are the two scarcest things in California at present.

—About 30,000 inches of water have been developed in southern California during '98 and '99.

—The Overton Lumber Co., Nevada county, Cal., has an order for 1,000,000 orange boxes for southern California.

—"Machinery hall is chock full," says Secretary L. K. Armstrong of the mining department of the Spokane, Wash., Industrial Exposition.

—The gross receipts of the Mexican Interoceanic Railway for the week ending Sept. 23, '99, were $72,285.19; for the corresponding week in '98, $50,740.91.

—About 10,000 acres of coal land in Santa Fe county, N. M., have been sold by the Atchison, Topeka & Santa Fe Railroad Co. to the Colorado Fuel & Iron Co.

—The Morenci & Southern Railroad is incorporated at Phœnix, Arizona, to connect with the Arizona & New Mexico road at Guthrie. The road will be twenty miles long.

—The ton, the bushel and the pound were the old terms of measurement, but are passing away. When people are asked about anything now they generally answer by the carload. It is so with ore, cattle, lumber, potatoes, fruit, etc.

—Thousands of troops leave San Francisco weekly for the Philippines. On the transports also go thousands of tons of supplies. In the hold of the Glenogle, which sailed on the 2nd for Manila, was twenty-five miles of railroad—all but the ties.

—At Denver the Colorado Fuel & Iron Co. has increased its capital stock to $25,000,000, of which $2,000,000 is preferred and entitled to 8% dividends. The directors are authorized to issue $12,000,000 additional stock in payment for property and improvements.

—The South Yuba, Cal., Water Co. is building a new reservoir at Banner Ridge, Nevada county, to supply the Union Hill and Brunswick mines with water for power. It is 800 feet long, 250 feet wide and 8 feet deep. Ten thousand feet pipe will connect the mines with the reservoir; the first 8000 feet is 22 inches diameter, the last 2000 feet 18 inches.

—This week freight rates on antimony, antimony ore, asphaltum, bituminous rock, beans, canaigre chips, copper, cement, glue, hay, hemp, infusorial earth, lumber, ore, manganese ore, chrome, rags, borax, canned salmon, rubber junk, canned goods, junk, saponified red oil, hair, cattle, blue vitriol and wine will be raised by the Southern Pacific Co., from 45 and 60 cents per 100 pounds to 75 cents from all California points to all Texas points, New Orleans, New York and Boston.

—The Utica, Cal., gold mine's owners have put in a 3000 H. P. electric generator, to operate their stamp mill and compressors. The Butte County, Cal., Electrical Co. has taken up a water right and will deliver electric power at Oroville and Chico. The Visalia plant has a 3000 H. P. and gets power from streams on Mount Whitney. It has seventy miles of pole lines and delivers power to Visalia, Porterville, Tulare and Hanford, Cal. By the aid of this plant the foothills are irrigated and have been turned into a fine fruit country. The Porterville, Cal., Light & Power Co. have purchased the plant of the Porterville Electric Light Works.

—Samuel Gompers, president of the American Federation of Labor, says: "Trusts grow and will grow, and the organization of industry upon a higher and more scientific basis will continue to grow. It seems to me the lesson it teaches should be of benefit, particularly to the wage-earners. Wherever the workers are organized and have maintained their organizations their wages are higher and hours lower and conditions better, in spite of combinations of capital. Instead of trusts and combinations of capital opposing and antagonizing the labor movement they should take a more comprehensive view of the situation and try to make better friends of the organized wage-earners than they have done in the past. Organized labor will aid in formulating a proposition controlling the trusts."

Rock Drilling Contest.

At the annual Festival of Mountain and Plain at Denver, Colo., last week there was a three-days' rock-drilling contest in which eleven teams competed: the winners, McGilvray and Carboneau of Victor won first prize with a bore of 38⅝ inches. Following are the names of the teams and their records in the competition:

McGilvray and Carboneau, Victor	38⅝
Andregg and Chamberton, Cripple Creek	38 5-16
Lyons and Sapp, Altman	36¾
Hupps and Lindgren, Ouray	35⅝
Martelon and McCloud, Idaho Springs	35 1-16
McKenzie and Trewick, Leadville	34 15-16
Humphreys and Kirkbride, Gold Hill	34 7-16
Delphy Bros., Black Hawk	33¼
Coughlin and Pittman, Gold Hill	33 3-16
Ecker Bros., Black Hawk	32 5-16
McGowan and Dougal, Prescott, Ariz	32 1-16

Time allowed for each team, 15 minutes.

Personal.

F. W. PAGE is appointed Supt. Blue Gravel mine, Yreka, Cal.

W. B. WILSON is now Ass't Supt. Le Roi mine, Rossland, B. C.

N. S. BERRAY is now Supt. Commonwealth M. Co., Pearce, Arizona.

GEO. W. TEAL is now Supt. Pennsylvania group of mines, Boulder, Colo.

ERWIN D. TREADWELL is the new manager of the smelter at Big Bug, Arizona.

M. M. KETCHUM is the new Supt. at the United Copper M. Co., Cuprum, Idaho.

M. C. MURTAGH is Gen'l Mgr. Idaho Consolidated M. Co., Golden Gate, Idaho.

J. C. CAMPBELL is the new Supt. of the Mountaineer mine, Nevada county, Cal.

WARREN CABLE has charge of the White Elephant and Booth mines, Sumpter, Or.

COL. ALEX. MAJORS, now in his 86th year, is locating mining claims at Republic, Wash.

JNO. SUTHERLAND is the new Mgr. of the Golden Horseshoe M. Co., West Australia.

PROF. S. H. EMMENS of "Argentaurum" fame, is now president N. Y. Liquid Air Co.

E. H. KIRBY of Denver, Colo., succeeds J. B. Hastings as Mgr. War Eagle M. & D. Co., B. C.

F. HEURTEVANT, managing owner Red Hill mines, Trinity Co., Cal., has returned from Paris.

A. B. CALL is now superintendent of the S. Hardman gold mines at Goldenville, Nova Scotia.

D. E. BIGELOW of the Union Iron Works, San Francisco, has returned from a northern business visit.

FRED'K IRWIN will superintend the boring of the 6300-foot tunnel at War Eagle mountain, Idaho.

P. W. GATES of the Gates Iron Works Co., Chicago, Ill., has returned from a business trip to Europe.

B. I. WHEELER has arrived at Berkeley, Cal., from Cornell, and taken charge as president of the University of California.

R. N. TRUMAN will return from London on the 15th inst., to assume charge of the Ray Copper M. Co., Riverside, Arizona.

J. W. NEILL, Gen'l Supt. U. S. Mining Co., Utah, is in Boston conferring with officials of the company as to the building of a smelter.

GEO. T. RIVES, Supt. Golden Cache Con. M. Co., British Columbia, is in San Francisco buying machinery and a 50-ton cyanide plant.

A. W. ROBINSON, engineer Bucyrus Co., South Milwaukee, Wis., who recently returned from a trip to Europe, is visiting the Pacific coast.

W. S. KEYES, who has been in Montana and Utah as expert in law suits in progress or about to commence in those States, has returned to San Francisco.

S. W. DORSEY of Colorado has been in the Picacho district, San Diego county, Cal., with a party of mining men, investigating the mines of that district, in which he is interested.

W. G. DODD of the Union Iron Works of San Francisco, has returned from a four months trip through the Orient, visiting the American mines in the vicinity of Chemulpo, Korea.

JNO. HOWELL, formerly of California and Nevada, and later prominent in connection with the Broken Hill Proprietary, Australia, is now Supt. Bora Creek silver-lead mine, Inverell, Australia.

E. G. STOIBER of Silverton, Colo., is locally reported to have sold his interests in San Juan county, including the Silver Lake property, to New York and Boston men for $2,000,000.

R. C. TURNER, who for several months past has been operating a hydraulic mine in Plumas county, Cal., has gone to Sonora, Mexico, to take the superintendency of the Santa Rosalia mine, which is owned in San Francisco.

F. HAIGHT of Salt Lake City, from Anvil City, reports another "strike" at Cape Prince of Wales, 100 miles north of Cape Nome. He thinks there may be gold there—probably a stretch of gold beach from Cape Nome to Cape Prince of Wales.

S. H. LUCAS, who for several years has been operating the Garner mine on the Mokelumne river, Cal., near Big Bar bridge, has gone to Lower California to look into the mining situation in that section. Mr. Lucas was formerly interested in Lower California mines.

JNO. W. BURTON says of the Klondike that the reports of enormous fortunes secured in that country are either exaggerated or pure fabrications. He is personally acquainted with seven men who were helped out of the Copper river country by the Government, and the steamboat company sent off a report that each of them had with them fortunes of $20,000 to $30,000, when, as a matter of fact, they were sick and destitute. Mr. Burton did work for himself on some of the tributaries of the Yukon, but found it difficult to make enough during the open weather to keep soul and body together during the long and dreary winters.

Obituary.

D. B. GILLETT, a well-known mining man, recently in charge of reduction works at Silver City, N. M., died at Enfield, Mass., on the 23rd ult.

JOHN MELTON, a prominent El Dorado county, Cal., miner, died at Placerville, Cal., on the 30th ult.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BARK CUTTING AND REDUCING MACHINE.—J. C. Hagerty, Santa Cruz, Cal. No. 633,646. Dated Sept. 28, 1899. The object of this invention is to provide an improved machine for cutting, shaving or reducing bark to a fine condition in preparation for its further use for the purpose of tanning or other uses to which it may be put. The invention consists of an enclosing casing and a disk revolvable therein. Obliquely disposed collars are fixed to the disk and an obliquely disposed feed chute opens through the side of the casing. A correspondingly concaved shear plate has its edge beveled to coincide with the inclination of the chute and by this the cutting is effected. Pins or lugs are fixed to the disk and to the interior of the case so that they pass each other; they loosen up any bark which is inclined to lodge within the case.

OIL BURNER.—August Johnson, San Francisco, Cal., assignor to the Oil Fuel Saving Company, of same place. No. 633,761. Dated Sept. 28, 1899. The object of this invention is to provide an apparatus for the combustion of oil to be used in furnaces. It consists of a combination of a mixing and burner tubes with peculiarly fashioned discharge nozzles, and means for regulating the supply of air and oil thereto. The exterior tube has the front flattened to form a horizontally divergent opening and a segmental interior tube has its upper portion essentially coincident with the curvature of the corresponding part of the outer tube. It has a flat bottom whereby air passages of different areas may be formed in the upper and lower part of the outer tube. A compress flattened nozzle is formed at the front of the inner tube and discharges centrally through the opening of the outer tube and an upwardly inclined neck is formed so that the air discharged from the lower part of the outer tube is deflected upwardly to intersect and mingle with the vapor escaping from the inner tube. An oil supply pipe leads into the inner tube, and there is also an inclined divergent deflector upon which the oil is received. Through a suitable inlet air is supplied to both the inner and outer tubes, and, by means of a suitable damper, the passages may be connected or separated from each other at will to regulate the supply of air into the two parts of the burner.

SAIL RIG FOR SHIPS.—A. V. Smith, San Francisco, Cal. No. 633,705. Dated Sept. 28, 1899. The object of this invention is an improved arrangement of sails by which the pressure of the wind is better applied to the propulsion of the vessel and the pressure on certain portions of the sails may be relieved when tacking ship or going about in sailing on the wind. The sails can also be handled with much less force of men than in the ordinary arrangement. It consists of one or more rectangular frames with netting stretched thereon, these frames being turnable upon a vertically arranged spar in line with and at the rear of the mast. The sails which are carried upon these frames are an upper one having its upper horizontal edge seized or secured to the framework and the other edges convergent to a point below, and other triangular sails having their outer vertical edges similarly secured to outer portions of the framework, and they are so shaped that when the angular points are drawn toward the center they combine with the upper sail to form a complete sail. By means of suitable sheets the point of either of these sails can be relieved when the vessel is to go about, and at the proper time the lower point of the larger first-named sail can be allowed to move back upon a diagonal stay which extends between the masts, a ring or traveler being fixed to the lower point of this sail to allow it to thus move. Counterbalance weights are also used in conjunction with the sheets and may be carried below the deck, the lines therefrom passing over suitable direction pulleys.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPTEMBER 26, 1899.

633,638.—TIRE CEMENT—Burr & Hendrickson, San Fernando, Cal.
633,804.—BURIAL VAULT—J. N. Chamberlain, Dallas, Or.

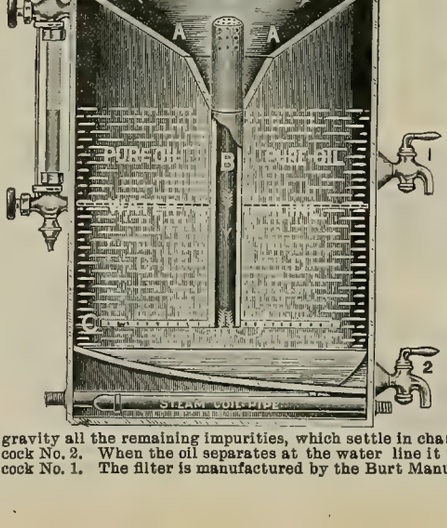
NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.



"Smooth On" Castings.

In ordinary foundry practice many iron castings are rejected which could as well be saved. Their strength is not affected by blemishes; the only reason for dumping them on the scrap heap is their appearance. "Smooth On" castings will make a leaky casting steam-tight, and the way it cures such defects as blowholes, shrinkholes and other common blemishes is a revelation. "Smooth On" is not a mere filling. It is a dry, metallic composition, which, upon being mixed with water, becomes a hard metallic iron that is insoluble in water, petroleum or oils; that will withstand an intense heat, and, the expansion being the same as iron, is why it is sometimes called magic iron. This material can be finished, polished and hammered, and when applied to a blemish in a casting by skilled mechanics the blemish is removed.

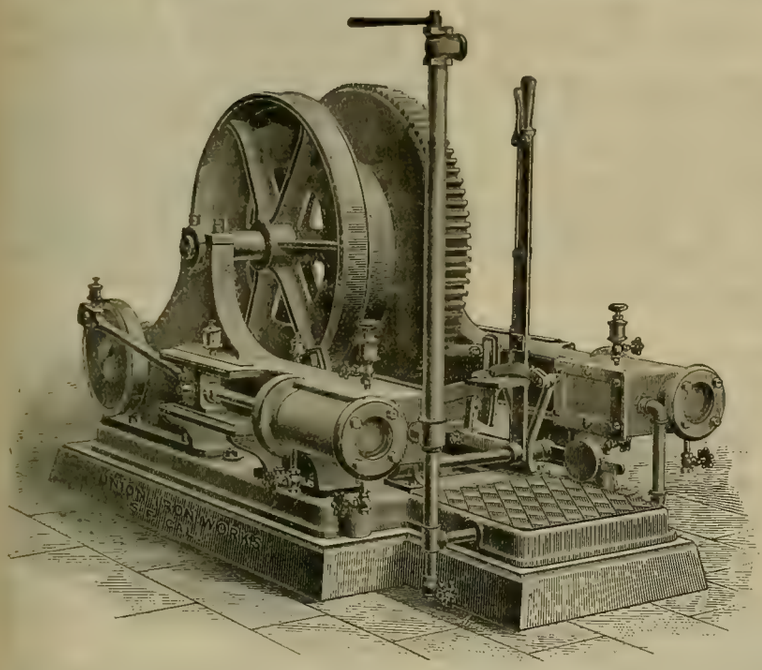
Hundreds of breaks or fractures in hydraulic machinery, leaks in connections on steam or water work, have been permanently and cheaply repaired. Difficult flange connections on cast iron and wrought iron piping can be made with this plastic material, as it adapts itself to the flange faces whether parallel or not. It takes care of the boltholes, as well as the patches on boiler work, in place of red and white lead and iron fillings, commonly used for such purposes.

The manufacturers of this material are practical chemists. All materials are carefully prepared and tested, to obtain the best results and maintain the highest standard of efficiency. "Smooth On" castings is manufactured by the Smooth On Mfg. Co. of Jersey City, N. J., and Messrs. Madison, Bruce & Sellers, 34-36 Steuart St., San Francisco, are the agents for Pacific coast. *

Warden Oil Filter.

Herewith is an illustration of the Warden Oil Filter.

The bottom chamber *D* is filled with pure warm water heated by a steam pipe passing through the filter under the false bottom; little steam is required, and if the filter is kept in a warm place it will not be necessary to make steam connection.



The waste oil is poured in at the top of filter, then passes through the pan of waste which collects nearly all the impurities. This pan extends to the nickel-plated rim, and the oil must pass through the waste before it flows into the tube *B*, thence into chamber *A* and through the perforated tube *B* down as shown by arrows, and on to perforated filter plate *C*, where the increased weight of the water has a tendency to keep the oil back in the tube *B*. The pressure of oil in chamber *A* forces it down and spreads it out over the plate *C*, in a THIN FILM which constantly changes surface and grows thinner as it travels from the center to the circumference of plate, thus exposing EVERY PARTICLE of waste oil to the action of the water. When the oil leaves the filter plate it is thoroughly mixed with the water which washes it out and separates by gravity all the remaining impurities, which settle in chamber *D* and can be removed through cock No. 2. When the oil separates at the water line it is pure and can be drawn off from cock No. 1. The filter is manufactured by the Burt Manufacturing Co., Akron, Ohio.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

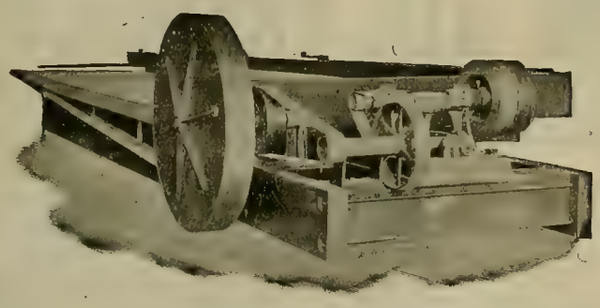
DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.



The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

Over 2000 in Use.

KEPT IN STOCK READY FOR SHIPMENT.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

THE WILFLEY CONCENTRATORS HAVE LARGE CAPACITY, EASY ADJUSTMENT, ARE SIMPLE IN CONSTRUCTION, AND NOT LIABLE TO WEAR.

Portable Hoisting Engines,
Electric Hoisters,
Wilfley Concentrators,
Machinery and Supplies of all kinds and for all Mining Purposes.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT.

CAPACITY FROM 5 TO 10 STAMPS.

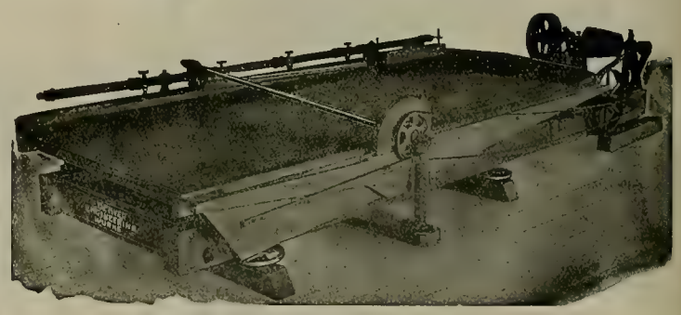
Mining Machinery and Engine Building

A SPECIALTY.

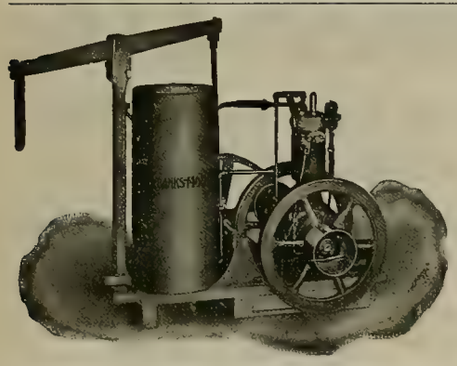


The most modern, completely equipped and up-to-date plant in the Northwest. Everything new from end to end.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :



The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : :

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

DOUBLE CYLINDER SINGLE DRUM HOIST.

MINING AND MILLING MACHINERY.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

Office: 505 Mission Street, San Francisco, Cal.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POSTPAID. Following is a partial list:

Treatment of; O'Driscoll.....$2

MINERALS:
"How to Study Them," Dana, 2nd edition. $1 50
Dana, American locality of mineral, 6th edition.....$1

If you do not find what you want in above list send for catalogue and price list, sent postpaid to any address. **Book Department Mining and Scientific Press, 330 Market street, San Francisco, Cal.**

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see this Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to

AMOS C. SPRINGER,
976 PINE STREET..... .....SAN FRANCISCO, CAL.

Aaron's Assaying, Parts II and III.

THIRD EDITION---REVISED AND REWRITTEN.

The Third Edition of Parts II and III of this great work on assaying is now ready; new type; new illustrations; new matter; better than ever; reduced in price to $1.50 postpaid to any part of America. The practical character of this book has made it the favorite everywhere in the mining world among men who want such a manual on assaying.

Address Book Dept. Mining and Scientific Press,
330 MARKET ST., SAN FRANCISCO, CAL.

FIRTH'S DRILL STEEL, 16 cents per pound.

The best drill steel on the market. Has no equal for hard rock drilling. Miners cannot afford to use an inferior steel when FIRTH'S can be bought at the above price.

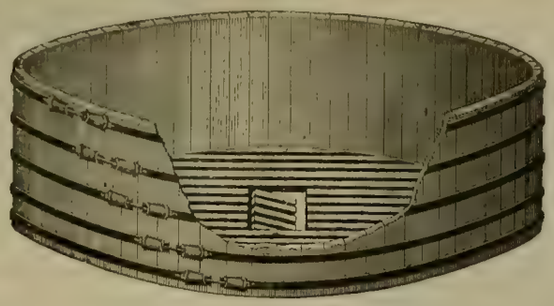
No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.



The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

WHATEVER IS POPULAR DESERVES ATTENTION.--THACKERAY.

10x12 LIGHTNING QUADRUPLE FRICTION HOIST.

Unquestionably the Most Popular Friction Hoist in the Market is the

...BOLTHOFF...
Lightning Quadruple Friction Hoist.

Requires less power to apply and gives better contact for friction surfaces than the double friction types. By carrying the brake band between the frictions the strain is reduced to a minimum.

COMPLETE HOISTING OUTFITS CARRIED IN STOCK.

Can I Become An Electric Mining Engineer?

YES, You Can. We guarantee we can make a thorough electric mining engineer of you at your home by our new system of correspondence instruction. Our instruction papers are prepared by the highest authorities and include every branch and method employed successfully to-day in electric mining. Course includes: General conditions of mines; Systems for the application of power; Mine wiring; Signaling; Electric haulage; Hoisting motors; Operation of electric mining installations; Cost of electric mining equipment, etc Our terms are within reach of all: $5 or $2 per month or cash in advance. *Write for our free illustrated book* (120 pages); it will pay you to read it. We teach also **Electrical and Mechanical Engineering, Mechanical Drawing,** Telegraphy, Telephony, etc., by mail. THE ELECTRICAL ENGINEER INSTITUTE OF CORRESPONDENCE INSTRUCTION, Dept. 21, 120-122 Liberty Street, New York.

I consider the Electrical Engineer Institute as conducted by Messrs Weffler and Martin to be of great value to those who desire an Electrical education

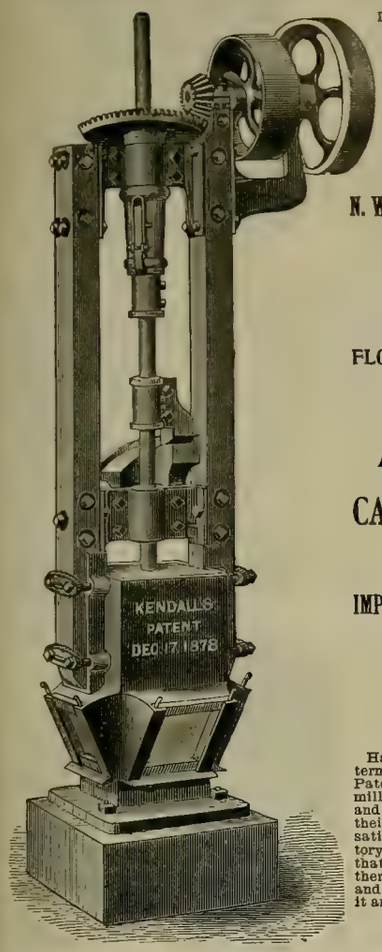
THE JOHNSTON CONCENTRATOR.



DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Market Reports.

SAN FRANCISCO, Oct. 5, 1899.

SILVER.—London, 26⅝d; New York, 57¾; San Francisco, 57⅜@58⅝; Mexican Dollars, 47⅛@48¾; New York exchange, sight, 12½; telegraphic, 15 cents premium.

Silver is slowly falling, the past week having seen a further reduction in price of a small fraction. Eastern cities are still unable to obtain the necessary silver for daily use in trade.

LEAD.—New York reports quiet, $4.60 bid, $4.65 asked; brokers' price, $4.40.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6¾c.

COPPER.—New York reports Lake very quiet at $18.50; brokers' price, $18.37½@18.50. Local—Mill copper plates, 23¾c.

The consumption of copper continues large, and the mills are busy, but the market is quiet. The Calumet & Hecla and other producers are asking 18¼c. Buyers seem to entertain the idea that there is nothing to be lost by deferring purchases, and are therefore disposed to postpone buying. The arrival at Baltimore of an additional lot of over 500 tons of Chili bars from England is noted, where in pursuance of a contract recently made the Chili copper thus imported is to be remelted into other shapes of commercially refined copper.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—11¼@20c per pound.

TIN.—Firmer, $32.30 bid; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $46; export, $41@41.50; carload lots, special rates.

Within the past week another small raise in the price of quicksilver for export is noted, while the price for domestic remains unchanged.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

PLATINUM.—London, 63⅛s per ounce; York, $16.25; San Francisco, $16.75.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5½@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c per 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5¼c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7¼c; 6s, 10 oz., 6¾c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.20; less than 200 gals., $1.25; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 56c; cs., 66c; raw, bbl., 54c; cs., 59c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 19c; Astral, 19c; Star, 19c; Eocene, 21c; Extra Star, 23c; Elaine, 24c; Water White, bulk, in tanks, 13c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 47c; cs., 52c; No. 1 bbl., 42½c; cs., 47½c; Neatsfoot Oil, bbl., 55c; cs., 65c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

NO MORE PACKING DIRT TO WATER.
—THE—
PNEUMATIC PROSPECTOR.
Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.
NO WATER NEEDED.
Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.
Weight 160 lbs.
Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.
SEND FOR DESCRIPTIVE CIRCULAR.

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of September, 1899, an assessment (No. 20) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of October, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1899, an assessment (No. 1) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of October, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. W. PEW, Secretary.
Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

CONSOLIDATED CALIFORNIA & VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of September, 1899, an assessment (No. 14) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of October, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
A. W. HAVENS, Secretary.
Office—Room 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of September, 1899, an assessment (No. 13) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
JOSEPH H. MOOSER, Secretary.
Office—320 Sansome street, room 24, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1899, an assessment (No. 33) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

The Resources of Nevada.

The Great Basin comprises a vast tract of country lying between the continental divide of the Rocky Mountain system on the east and the Sierra Nevada on the west. The greater portion of this territory is covered by the States of Utah and Nevada. So frequently are allusions made to the "sagebrush plains of Nevada" that many have conceived the idea that Nevada consists of broad, nearly level, plains of sand and alkali, dotted with a sparse growth of the hardy sagebrush. This conclusion is erroneous, for the topography of the State is rugged. It is ribbed with a series of mountain chains extending generally in a northerly and southerly direction, with deep and fertile valleys between. The soil is fertile and only requires irrigation to make it wonderfully productive.

Its mineral resources have been proven abundantly. They include gold, silver, lead, copper, iron and numerous other minerals of economic value. The great mines of the Comstock lode have never been equaled for richness and extent elsewhere. This one great vein is credited with a production of nearly half a billion dollars in gold and silver. In the Eureka district $125,000,000 in gold, silver and lead has been produced, adding to the wealth of the world and State and also to its fame. This enormous mineral wealth has been obtained chiefly from high-grade ores, the less valuable ores still remaining; but as this is an age of extensive operation on low-grade material, the large deposits of this character still in these mines may soon add largely to Nevada's already large production.

Austin in the early '60s was one of the most prosperous mining towns in the West. Not less than $26,000,000 was taken from the veins of Lander county. As is the case at Eureka, the rich ores have produced most of the output and the low grade remains for the present and future generations to make available.

There are also Tuscarora, White Pine and Pioche, all populous and prosperous mining towns in their time, with every probability that at no very distant day the activity of the past may be renewed and a prosperity more enduring than before established. In Esmeralda county new mining camps are springing into life and a stream of copper and gold is being sent out from newly discovered mines and from old ones now worked for the first time at an advantage.

FAMILIAR MINING SCENES IN NEVADA.

The idea has become prevalent that Nevada has mines of silver only. This is a mistake, for all the silver-producing mines are producers of gold also, and in some sections the gold largely predominates. Ten years ago there were but two or three gold mines operating, strictly speaking, in Arizona. To-day Arizona has gold mines in every county, and some of them large and rich. The same condition obtains in Nevada to-day as was found in Arizona in 1890. J. R. DeLamar has gone into Nevada, depending on his own judgment and not on hearsay or tradition, and has proven that a rich gold mine existed in Lincoln county where none was supposed to be found. There is a drawback to the more rapid advancement of the development of Nevada's resources and that is a lack of railways. The natural tendency is for railroads to build in an easterly and westerly direction through the great undeveloped West, but as previously stated the topography of the country renders this a hardship, as it necessitates climbing over one range of mountains after another, which is expensive. Railroads may readily be built in a northerly and southerly direction in the valleys, however, and in time this will be done, rendering more easily accessible Nevada's mineral resources. There are still to be found great veins of lead and zinc carrying silver, and prospectors are finding valuable copper deposits. But when the active search for gold begins, without doubt Nevada will produce gold mines as readily as Utah or Arizona. On this page are illustrations of some typical mining scenes in some of the most famous of Nevada's mining districts, and also an engraving of Austin in Lander county, surrounded by hills honeycombed in the progress of the industry that gave the State its fame.

LARGE production or large tonnage in the operation of a mine does not always imply large net profits.

IN the progress of the mining suits now pending at Butte, Mont., the usual discrepancies between the judicial and scientific understanding of geological occurrences are noticeable.

A DISCONTINUANCE of the gold production of the Witwatersrand mines, which is likely to result in the event of war, is likely to have a marked influence on the commercial world, and it will undoubtedly create a panic in the London mining share market.

RAINS have begun throughout California, notably in the mining counties. It is likely that the shut-down which has resulted from the dry season will not be of long duration, and the several hundred miners who have been temporarily out of employment will soon again be occupied.

MINING COMPANIES which declare dividends without earning them do so with but one purpose in view—to sell stock to the uninitiated investor, using a portion of his money in the payment of more dividends, gradually boosting the stock and working it off at a good profit to the manipulator. Beside this scheme a lottery business is an honest, legitimate enterprise.

AN innovation is being considered in the Lake Superior copper region in the establishment of a custom mill for stamping copper ores, it being contended that it can be established as successfully as a smelter in smelting districts, besides affording aid to the development of new mines. It must be viewed as an experiment, but one which should meet with encouragement and success if properly managed.

A LARGE number of oil companies are being incorporated in California, the greater number being on a purely speculative basis. The outcome will result in the average number of successes and a large percentage of failures. Prospecting for oil is not more certain in its results than mining for metals, and until oil lines have been established by geological investigation, some of these new ventures are "wildcats."

The Old Times and the New.

A revival of the mining industry in numerous old camps which, after a season of activity, had fallen into idleness and decay is a noticeable feature of the industrial conditions prevailing at the close of the nineteenth century. Mines which a few years ago were considered worked out, or which had reached a condition where the ores no longer offered an inducement for their extraction and reduction, are now being successfully operated under improved methods, advanced knowledge of the treatment of ores and more favorable economic conditions generally. A stimulus is given by the large demand for metals, it is true, but this demand has not cheapened labor, nor have processes been cheapened thereby, though the latter have been greatly improved through the application of scientific experiment, which has resulted in a constantly increasing knowledge of the proper application of method. In every part of the mining world marked advancement has been and is still being made in the metallurgical branch of the mining industry and the results of this experience of an army of practical workers is disseminated through the medium of the publications of engineering societies and the technical press. If the knowledge gained by an intelligent scientific experimenter were retained by him and held as a priceless secret, the advancement of metallurgy would be slow, and each worker would from necessity be obliged to learn by study and experiment what another had already learned. It is this universal dissemination of valuable knowledge that has so rapidly advanced the mining business and brought about its present unprecedented condition, making success possible where a short time since failure could only have resulted from lack of this necessary knowledge. Innovations are commonly introduced and often with complete success, proving that the old-time methods were not really the best, and showing that the continuance of antiquated practice may often be abandoned with advantage. In this connection some novel experiments in deep shaft sinking and exploitation may be looked for. The most important question now being debated is whether to carry on deep mining by relay or by a single winding. The idea of breaking the shaft and offsetting the second and third sections a proper distance is one having merit, but there are questions of great importance to be determined in this matter.

The size of the engines and reels for hoisting from great depths is so great and the underground chamber required for their installation and operation would be so extensive that it may not be practicable to operate by this system in many cases, owing to the character of the ground. The getting of such heavy machinery down shafts of ordinary size is also going to offer some objections to relay stations, but it will undoubtedly prove a question of expediency in each individual case. Stage winding has not yet been tried except in a small way, hoisting by auxiliary small engines, operated by compressed air or electricity from a few hundred feet. On the other hand, a direct vertical lift of 5000 feet is an accomplished fact, and it seems that this depth may be considerably and satisfactorily increased before stage winding becomes a necessity.

A DECISION recently rendered in the Circuit Court of Colorado, while in line with the strict and literal interpretation of the law, which requires that a notice of forfeiture be published in the paper nearest the mine, seems to work hardship. In this instance the defendant carried his notice over the only trail open or passable during winter and published it in a paper printed in the county in which the mine was located, but at a greater distance from the mine than another paper printed in a town in an adjoining county. This decision is likely to lead to some fine discrimination in distances in similar cases hereafter.

IN Tuolumne county, California, nearly all the leading mines, excepting those provided with steam plants, are closed down owing to the failure of water supply, and over 600 men are out of employment as a consequence. This state of affairs must continue for several months, or at least until the rainfall refills the reservoirs of the Tuolumne Water Company, from which most of the mines of the county are supplied with power. This situation is only a recurrence of that of former years and affords material for the serious consideration of energetic capitalists looking for a legitimate field in which to make investment. It is not unlikely that the inactivity on the part of the Tuolumne Water Company may prove their own undoing.

A Test in Concentration.

A valued correspondent writes from Gilpin county, Colorado, that a series of tests have been made there in concentrating the tailings of gold ores in a typical Gilpin county mill. The machines tested were a Colorado bumping table and a California concentrator—an endless belt machine.

The figures given indicate that the test was not what it could have been, from a metallurgical standpoint. In one test the product of twenty stamps was fed to two belt machines, and the product of five stamps was sent to one bumping table. Gilpin county mills crush on an average about one ton per stamp each twenty-four hours, and the ore contains usually from 10% to 20% of sulphides—a very large percentage for concentration after stamps. This indicates that twenty tons of ore containing from two to four tons of sulphides were daily sent over two belt machines and that five tons were in the same period sent over a bumping table, but no data is given as to the actual amount of concentrates saved. To make a test of this kind more valuable, it would be necessary to know the exact amount of ore crushed and the exact amount of concentrates saved by each machine, also the relative assay value of the concentrates from each type of machine.

The meager figures given indicate that the belt machines were greatly overloaded and the concentrates were in all probability far from being clean.

In California the auriferous sulphides are usually high grade, running from $40 to $1000 per ton or over, with an average of about $100 per ton. The percentage varies from a fraction of 1% to about 6%, probably averaging in most of the mines about 2%. This small percentage and its high value have made close concentration necessary; and while it is not claimed that the best methods are in vogue in California, the saving effected is certainly very close. Usually two 4-foot belt machines are set to each battery of five stamps, and in some mills having a normal crushing capacity of two and one-half tons per stamp three 4-foot machines are set to the battery, indicating that the need of additional concentrating surface is recognized. Since careful and successful practice in California has demonstrated the needs in this direction, it is not apparent how successful concentration can be done on the heavily sulphuretted ores of Gilpin county with but two machines to twenty stamps, when these stamps should have been provided with not less than twelve concentrators. Either a dirty concentrate would result from such practice or a large amount of sulphides still remain in the tailings passing the machines. The sulphides of Gilpin county ores are low grade, however, containing from $7 to $25 per ton, probably averaging $15, and the loss may not be considered material. The figures which represent the conditions and result of the so-called test are given on page 439; and, while interesting in themselves, do not appear to constitute sufficient test.

FOR several years past the political troubles between England and the Transvaal have been growing more and more difficult of solution. Within the past few months these difficulties have multiplied and have taken more definite shape. Recently rumors of war have been frequently circulated, but through it all there was a faint hope that some means of a peaceful settlement of these difficulties might be found, but the latest press dispatches indicate that war is inevitable and may have actually commenced. The general impression appears to be that England will overwhelm the Dutch Republic, though at a heavy sacrifice of life and money. An American mining engineer, recently discussing these troubles, said: "Morally, the Boers are in the right, but the existing situation isn't business." This appears to be the actuating sentiment on the part of Great Britain, and it is not improbable that, as an outcome of the trouble, Cecil Rhodes' idea—"from the Cape to Cairo"—may materialize.

Concentrates.

A LITRE of the metric system is equal to 1.0567 quarts.

THE world's annual production of manganese ore is about 680,000 tons.

SIZING before concentration is always advisable and should be practiced.

AVOIRDUPOIS weight gives 7000 grains to the pound; troy weight, 5,760.

WOLFRAMINIUM is an alloy of aluminum, tungsten and copper; in romanium the copper is replaced by nickel.

IN a pan amalgamating mill one and one-third H. P. per ton of ore treated is usually considered essential.

MILL CONCENTRATES should be clean—free from quartz, slaty material or other debris not containing high value.

AUSTRALIA is now producing quicksilver, the Jamieson Q. Co. of Victoria making a sale of their production in August.

NARROW crushing rolls of relatively large diamter, run at high speed, are replacing broad rolls of less diameter run at lower speed.

IN mines where large timbers are used, each station at the shaft should be provided with blocks and tackle or chain blocks for handling the timbers.

THE prospector should cast aside all preconceived idea of how he should find a valuable mineral deposit and search for minerals as he may find them.

EXPERIENCE has shown that the character of wall rocks is no indication of value in a mineral vein. The most "favorable" conditions may be found, but no pay.

IT is not the miner with the heaviest hammer who can drill a hole most quickly. There is much art in striking a drill, and it can only be accomplished by long practice.

AMONG the causes for the recent advance in the domestic price of quicksilver may be mentioned the increased consumption and demand and the discounted reports regarding Spanish production and shipments.

SAND is of three kinds: silicious, calcareous and argillaceous. The former two are suitable for making mortar, but the latter is unsuited to this use. Quartz mill tailings usually make good mortar, if not too fine.

THE so-called "mineral soap" found near Otay, in San Diego county, Cal., is an ordinary clay, though containing a higher percentage of water than clays usually do. It has a peculiar greasy feel, which led to its being called soap.

THE United States imposes a duty of $4 per long ton on imported pig iron. In '98 the United States exported 50,121 tons pig iron to Great Britain. A ton of pig iron made at Pittsburg, Pa., costs about $8.25; a similar amount made in England costs about $13.

THE "Stephens process" is said to have been given a successful trial in treating "refractory tailings" at National City, Cal. Details are not at hand, but Mr. Stephens says he will send his "formula" to any mining man who wants to make tests.

ONE of the most satisfactory and successful methods of recovering fine flaky gold from beach or river sands is by sluicing over burlap, blankets, canvas or other fabric. This gives better results than riffles. The gunny sack is generally the best.

FOR deep level mining where large tonnage has to be handled, large skips are superior to cages, having been proven more expeditious and economical than the latter. They should be loaded by chutes from ore pockets under the levels and dumped automatically.

THE statement that the copper ores found in this or that mine are like those at the Anaconda or United Verde is of no significance, as copper ores of particular kinds are similar wherever found. It is a question of quantity, as well as quality, that gives value to a mine.

THE Canadian Copper Co., Cleveland, O., the Emmens Metal Co., Youngwood, Pa., and the American Nickel Works, Constable, N. J., are among the principal nickel refining works in the United States. A sample of nickel ore sent to any one of them would, doubtless, receive intelligent attention.

NOT long since uranium ores were seldom seen and little known, but recently such large amounts of this mineral have been found in Colorado that the world could be supplied from these deposits alone, and unless new uses are found for uranium, other discoveries will probably have only nominal value.

TIN has reached the highest price ever known in modern times, being about 32 cents, and lots have recently been sold in the New York market at a still higher figure. The natural inference would be that these prices would so stimulate search that new tin deposits would be found in various places.

THERE is a great variety of mill screens; among them are diagonal slot, horizontal slot, round punched, burred and smooth and wire screens. With different ores screens of various kinds give differing results. Experiments should be made to determine what kind of screen will produce the best saving at least expense.

THE large copper mines of Arizona are nearly all associated with limestone; those of Butte, Montana, are in granite; those of Lake Superior in conglomerate, sandstone and diabase; those of Ducktown, Tenn., in mica schist; those of Iron Mountain, Shasta county, Cal., for most part, in quartz porphyry; those of Idaho mostly in diorite.

IN a California mine where electric haulage is employed it is not an uncommon thing for men walking along the gangway to accidentally touch the overhead live wire with their wet hats. When this occurs they are invariably knocked down by the shock, though not otherwise injured. The voltage is sufficiently high to kill a man if he can not immediately free himself from contact with the wire; but as upon contact the victim immediately breaks the circuit by falling, it simply becomes an incident and not an accident.

THE greatest width of channel developed in the Hidden Treasure mine on the Forest Hill divide, Placer county, Cal., is 1610 feet. The white quartz channel has a length of 18,000 feet in this property. The employment of electric haulage effects a saving over animal haulage of $4.25 daily. The electric installation cost $20,000.

THE description of the Copper Queen mine, at Bisbee, Ariz., which appears herein, indicates that that property has been successfully managed under extreme and unusual difficulties, both as to the erratic distribution of the ore bodies and also in the character of some of the material through which mining operations had to be carried on.

THE "extra solution" of the Russell process is a solution of cuperous-sodium hyposulphite added to the charge after the first lixiviation of the silver chloride in the ore has been effected by the ordinary hyposulphite solution. It is claimed that the extra solution extracts an additional amount of silver which otherwise would not have been obtained.

PROBABLY Thos. A. Edison or his agent didn't say the silly exaggerations recently wired from New Mexico regarding the Ortiz mine possibilities. Then, too, it is to be borne in mind that alleged "Associated Press" dispatches, prepared in advertisement agency offices, are now published in daily newspapers as genuine press dispatches at so much per line.

LONG TIMBERS, boards, pipes, etc., to be lowered into a mine should be secured beneath the skip or bucket, this method being much safer than placing them in the bucket, and makes them far easier to handle, either at the surface or at the level where they are to be used. Where a shaft is inclined, a slide may be built between the tracks by nailing in two planks.

IDLE in a yard in Yuma lies a large four-wheeler built to freight ore from Castle Dome to the Colorado river—long the largest wagon in the territory, but now exceeded by a California wagon used by the Fortuna M. Co. to freight from Blaisdell, of which the bed is 20 ft. long, 5 ft. deep; the wagon weighs 7300 lbs. and carries ten tons when drawn by twelve mules.

UNDER all ordinary conditions, a battery crushing two tons or more of rock per stamp in twenty-four hours, should have two 4-foot belt machines for concentrating the sulphides, amalgam, gold and other valuable material of high specific gravity passing over the plates, whether the ore contain a large percentage of such material or not. If large—above 5%—another machine is advisable.

THE development of a mine should always be planned in such a manner as will permit the most economical handling of ore and waste when the mine is thoroughly opened and operating on a working basis. The work of exploration should always be carried well in advance of stoping, in order that there may be no delays during the sinking of shafts or while other exploratory work is in progress.

WHEN providing power for mining operations, it is economy to allow a good factor for safety and to put in a plant affording 50% to 100% more power than actually required. This will usually result in obviating delays and expenses for repairs, such as often occur to small plants taxed to their fullest capacity, and the work may be conducted without stoppage and the plant is prepared for an emergency.

TO REMOVE pieces of a broken drill from a bore hole, Prof. J. E. Woodland of the University of Worcester, O., constructed in the University laboratory an electro-magnet and 600 feet of insulated wire was secured for the connection. The magnet was made of soft steel rod 1¼ inches in diameter and 3 feet long. It was wound with four layers of wire, leaving 4 inches of the end of the rod bare. The pieces of the broken drill were removed.

A MINER must always look for all the peculiarities and irregularities occurring in his vein or ore deposit. Sometimes a small seam, if followed, leads to a large and valuable ore body. The greatest and richest mass of ore known—the Big Bonanza of the Comstock lode—was found by persistently following a small seam containing a little ore. A seam leading out from an ore body of the Copper Queen mine, Bisbee, Ariz., was noticed but was not followed until years later, when it led to a much larger and richer deposit than that previously worked.

C. D. S., Bisbee, Arizona, is answered on page 311 of the issue of Sept. 16; R. H., Butte, Montana, page 143, Aug. 5; H. F. P., Ouray, Colo., page 115, July 29; F. V. O'B., Redding, Cal., page 371, Sept. 30; G. S., Bingham, Utah, page 171, Aug. 12, '99. It is again earnestly suggested that a regular file be kept in all cases practicable. Questions are often received that have been recently answered and the possession of a current file of the paper would obviate the necessity of repetition. Thousands of our readers do preserve such a file and the idea is commended to universal observance.

THE bricks used in building the city of Deadwood, South Dakota, are mostly made from clay obtained in the neighboring gulches, which is often gold bearing; the sand used in making mortar is from the tailings from the Homestake mills. There is not a brick nor a pound of mortar in these buildings which do not contain gold. Several years ago brick making at an establishment near the town was discontinued, for the reason that it was found that the clay was rich enough in gold to pay for puddling and sluicing; but hundreds of thousands of bricks had been burned at this yard before the fact of the gold value became known.

ON the Jamul grant in San Diego county, Cal., a mass of diorite, normally of dark green color and fine texture, has been crushed and by the infiltration of mineral solutions from below the rock has been completely altered into a deposit of unusual character, consisting of calcium carbonate, silica and kaolin, each nearly pure and occurring mostly in segregated deposits. This material, by mechanical admixture in the proper proportions, was found to make a superior hydraulic cement, and works were built near the deposit in 1891 and a large amount of cement manufactured, but for commercial reasons the enterprise was a failure.

WHEN silver-lead bullion is melted and then allowed to cool to near the melting point, crystals of lead will separate out which are much poorer in silver than the lead was before melting. This fact is the basis of the Pattinson process. The lead crystals are skimmed off and more silver-lead bullion added, the heat increased and the mixture stirred on cooling again; the additional newly formed crystals of lead are removed as before. By repeating this process the greater portion of the lead is removed poor in precious metals, and the gold and silver contents of a large amount of bullion are concentrated to a small amount of lead and then cupelled to effect a complete separation.

WHERE a man is hired "by the week" and paid "by the week," in the absence of any written contract, the connection can be severed by either employe or employer at a week's notice. In California a corporation is required by law to pay its employes at least once every month. The signing of a contract for labor or anything else in the presence of a notary or other public official gives no added validity to the agreement. The difference between a contract being signed in the presence of a notary, and not being so signed, lies largely in the assumption that where a contract is signed before a notary, etc., each party is prevented from claiming that he did not understand the terms of the agreement.

THE rich pay shoot of the Eureka-Idaho-Maryland mine, near Grass Valley, Cal., appeared at the surface in the Eureka claim. While the vein continued in the form of a clean quartz vein for some distance in a northwesterly direction, the pay stopped; but easterly from the limits of the pay zone, the fissure continued for several thousand feet uninterruptedly, but contained only a small amount of quartz. The dip of the fissure is to the northward, and along it the pay shoot had a downward and easterly trend at an angle of about 20° below the horizon. Vertically the shoot was 500 to 600 feet across—this might be considered its length, as it would be if it stood steeply in the fissure. In width the shoot ranged from 1 to several feet. It has been worked over 4000 feet and has produced more than $16,000,000.

AS THE mining laws become more commonly understood, there are more relocations of claims for non-performance of assessment work. Many claim holders have appeared to believe that they could relocate their claims at the end of each year and hold them as against any would-be "jumper," some even going so far as to post a notice on the claim warning others to keep off; but the law requires that assessment to the amount of $100 or improvements in like amount be made annually, and a failure to comply with this renders the claim subject to relocation. Where the assessment work has not been done, and the claim owner is on the ground at the expiration of the year, he must at once commence his work of assessment, and must actually complete it, exercising reasonable diligence in so doing, for the claim still remains open to relocation until the assessment work has been actually and fully performed.

COLEMANITE is a crystallized borate of lime. The colemanite mined in the east Calico district, San Bernardino county, Cal., occurs in the form of a vein, but contains no quartz. The walls are shale. It is simply the result of residual deposit or crystallization from saturated solution in a lake bed of Tertiary time, the deposit being subsequently covered by detritus washed into the lake from the surrounding hills until a thickness of several hundred feet had been attained. Later with the injection of the andesites and uplift of the region the bed was tilted, the edges eroded and the colemanite exposed. The so-called "cotton balls" are similar to colemanite in composition. It is known as pandermite and occurs as an efflorescence on the surface of the ground in regions where borax is found. The mud shales of the district also contain a considerable percentage of borax in the form of calcium borate.

BEFORE the parting of gold and silver in bullion bars the metals are granulated. The metals are first melted in a blacklead crucible, and when in a state of fusion are stirred with an iron rod to make the mixture uniform. A small quantity of the molten metal is dipped out with a ladle and poured into a copper tank filled with water, in which a stream of cold water is constantly running. By this means the metal is granulated into tabular or leaf-like grains. When dried the granulated metal was formerly placed in porcelain vessels, covered, and provided with an escape pipe for fumes of nitrous acid. Nitric acid was poured upon the metal and the vessels heated in a water bath till boiling hot. The boiling continued until the silver had been dissolved. The solution of silver and base metals was syphoned off and the gold collected, refined and melted. The silver was recovered from the nitrate solution by adding salt water, converting the silver to chloride, the sodium becoming nitrate. The chloride of silver was mixed with granulated zinc and treated with sulphuric acid, which reduced the silver to metallic state, the zinc and acid being lost. This method has been superseded by the sulphuric acid process, in which the metals are granulated and then subjected to the action of concentrated sulphuric acid at 65° Baume. The silver is converted into sulphate and the base metals become salts, the gold remaining on the bottom of the cast iron vessel in a nearly pure state. The sulphate of silver solution is syphoned into a tank containing copper plates, which reduce the silver to metallic state, it being deposited on the copper in thick layers.

IN the District Court of Gunnison county, Colorado, Judge Stevens has rendered an important decision in the Bull Domingo case, in which the Court has interpreted the law according to its exact wording. The Bull Domingo mine was recently sold to S. I. Hallett for $50,000 by W. Haynes and others under bond and lease, a portion of the amount being in cash. Haynes originally had as a partner in the claim, G. C. Briscoe, who for years assisted in the development of the property. In '96 it was alleged that Briscoe failed to contribute his proportion of the expenditure for annual labor, and in January, '97, Haynes caused a notice of forfeiture to be published in the *Miner*, a paper printed at Pitkin. The claim is on Italian mountain and is accessible only by trails for the last eight miles. From the mine on an air line Crested Butte is fourteen miles distant, Aspen eighteen miles, Crystal twenty-two miles and Pitkin twenty-seven miles. As all roads and trails were closed except that to Pitkin, Haynes took the notice of forfeiture to that place for publication, although newspapers were regularly printed in all of the other towns mentioned. The County Surveyor made a survey to ascertain the distances from the mine to points where papers were printed, and upon the showing that Pitkin was farther distant by air line than any other point, Judge Stevens held the publication of the forfeiture notice to be void. This decision is in accordance with the letter of the United States Statutes, Sec. 2324, which says the notice shall be published in the newspaper published nearest the claim, and makes no mention of ways or means of reaching such place. The case will be appealed.

The Copper Queen Mine, Arizona.*

By JAMES DOUGLAS, LL.D.

The Copper Queen mine was opened in 1880 by Messrs. Martin, Ballard & Reilly, and the first copper furnace was blown in on August 20th of that year. Prior to that summer nothing but prospect work had been done on the Copper Queen and a number of adjacent claims. In fact, it was a small deposit, not of copper ore but of cerussite, which still remains undeveloped, on the western slope of the Queen hill, which first tempted miners to the spot. To reduce this lead ore, a primitive furnace was erected near a spring, now dry. The development, just then, of this and other copper deposits in the southern Territories was due to the simultaneous arrival of the Southern Pacific and the Atchison, Topeka & Santa Fe railroads, though it was stimulated by the business revival of 1880, with the consequent rise in the value of copper.

The geology of the Dragoon and Mule Pass mountains, in which the Copper Queen mine is situated, has not been systematically studied. On the flanks of a granite core lie beds of Carboniferous limestone. Those to the west carry, either enclosed or as contact deposits, the silver-bearing minerals which in the early '80s made Tombstone one of the most famous mining districts of the West. The limestones on the eastern slope of the Mule Pass mountains carry the ores of the Copper Queen mine. The limestone masses appear to be broken and filled by extensive bodies of intrusive feldspathic rocks, which seem to have exerted a decisive influence on the genesis of the ore, though their relation to the ore masses, whether these lie on the contact or are completely and deeply imbedded in the limestones, is a matter upon which theorists will differ. The feldspathic rocks to the east of the copper-bearing mass of limestones of the Copper Queen group are deeply colored superficially by oxides of iron, and, as recent explorations made by other companies than the Copper Queen show, carry iron and copper pyrites disseminated in particles and in bunches, but whether in profitable quantities or not has not yet been determined. The colored band of these adjacent rocks (which are supposed to be rhyolites, though their decayed character renders any determination of their original mineralogical composition doubtful) is broadest in contact with the Copper Queen and the Atlanta claims, where the largest bodies of copper ore have been discovered in the limestones, and tapers towards the south, where the ore bodies as yet found in the limestones are smaller and deeper. The contact of the limestones and rhyolites appears to represent the line of a great fault, which is also indicated by a marked depression in the surface.

Beneath this depression lie ferruginous clays, locally called "ledge matter," enclosing masses of ore, both oxidized and unoxidized; but the rocks at this level are altered by decay to such a degree that it is difficult, if not impossible, to define the line between altered limestone and altered rhyolite. Where, however, the deep workings of the Copper Queen have penetrated the feldspathic rocks, the ground has proved to be barren. Nevertheless, since the wealth of other mining districts in Arizona resides almost exclusively in the so-called porphyries, exploration in the same class of rocks in the Warren district is a legitimate enterprise.

The successful development of the Copper Queen mine, however, has been confined to the limestone belt lying between what appear to be two prominent faults—the one already referred to, and another to the west of the Queen hill.

The outcrop of copper which was first attacked, and which was, in fact, the only extensive surface indication, was on the northern exposure of a limestone hill. In this place stripping revealed a solid body of oxidized copper, iron and manganese ore over 60x60 feet in area, and so rich in copper that the furnace, fed from the surface ores alone, yielded for a few months 23% of metal. Fig. 1 shows a section through the open cut made on this body. This large outcrop was enclosed in an almost circular unaltered limestone frame. Associated with the ore was an abundance of calcite; but the percentage of silica was so small that quartz had to be added to the furnace charge. This body, retaining its general dimensions and well defined limestone walls, dipped at an angle of about 30° southeasterly into the hill. Between the 100 and 200-foot levels the ore changed into a clay, with well marked bedding, too lean in copper carbonate to be profitably worked; but below this zone of clay the copper, as carbonates and oxides, increased to 12%, and was associated in a measure with limonite, imbedded in ferruginous clay. This ore body extended to a depth of 400 feet on the incline from the surface, and there terminated abruptly in hard limestone.

The enrichment of surface copper ores and their rapid impoverishment at a shallow depth is not an uncommon occurrence in the "arid region" of the United States. It probably takes place through the oxidation, in this dry, hot climate, of the copper solutions which rise to the surface during the decay of the ore. A lower layer of ore is thus necessarily depleted, in proportion as the surface layer is enriched. The insensible flow, through the apparently dry rocks of the region, of moisture charged with soluble salts, is often evinced by the thick efflorescence of copper alum, which rapidly covers the walls of drifts run through or near feldspathic or argillaceous rocks, even when the copper contents of these rocks are so low as to be barely appreciable. During the dry season a waste heap of such refuse will be completely covered with a green coating.

On the other had, in the wet Eastern climate, as in Tennessee, the surface ore, where it has not been denuded by glacial action, consists of insoluble ferric oxide deprived by lixiviation of the copper which, in Arizona, under favorable atmospheric conditions, would be fixed as oxides. The rapidity with which a soluble copper sulphate when exposed to the air is converted into insoluble basic sulphate, and this into more highly oxidized compounds, is illustrated in many copper regions of the Southwest, where copper solutions ooze from almost barren decaying feldspathic rocks, and, on reaching the surface and filtering through the gravels, form copper-bearing conglomerates.

The first ore body, above mentioned, was not exhausted until 1884, when it had yielded about 20,000 tons of ore and 20,000,000 pounds of copper. The earliest months of that year were the gloomiest which the district had known up to that (or, fortunately, up to the present) time. Simultaneously with the commencement of active operations on the Queen, a large group of claims on the southern slope of the Queen hill had been explored by the Neptune Co., and a furnace plant had been erected by it on the San Pedro river, some miles distant. The reason for building the reduction plant so far from the mine was the scarcity of water in Bisbee, which at that period was so serious that the Copper Queen had to damp its single furnace for lack of a sufficiency of water to cool the jacket. The Neptune Co., after expending its capital and bonded debt, suspended operations in 1882. Another corporation, the Atlanta Mining Co., owning claims adjacent to the Queen, had been searching in vain more than four years for an ore body by following, to no profit, surface indications. Other minor operations of a like kind had been equally unsuccessful. At that date, the Queen Co., having reached the bottom of its ore body and the 400-foot level of the incline, could count only some three months' ore in sight; and the Atlanta had decided to abandon the enterprise after one more effort had been made to discover ore. The foot of the Queen incline, which coincided with the bottom of the original Queen ore body, had nearly reached the side line of the claim, and therefore a a drift easterly along the side line in hard limestone was the exploratory work undertaken by the Queen—a long drift having been previously run to the west without encountering any ore.

Meanwhile the Atlanta Co. was sinking a shaft in barren limestone a little to the south of the point towards which the Queen drift was directed. Thus, final pieces of exploratory work were under way prior to the abandonment of their property by both companies, when, almost at the same time, each of them struck a new ore body which appeared to be dipping northwest, or in a direction the reverse of that of the body originally discovered. The two companies then wisely decided to consolidate on equitable terms, rather than waste their funds in obtaining a legal interpretation of an even more complicated problem than that involved in the Richmond-Eureka "apex" case. Since then the claims of the Neptune Co., the Holbrook & Cave Co., the Silver Bear Co., and a number of private owners have been acquired. Many of them have proved to be barren, but not a few contribute their quota of ore to the total of the consolidated company's product, which is drawn at present from what would be some twenty different unprofitable mines, if each were under separate management.

The first ore body extracted extended from the surface to the original 400-foot level of the old incline, which corresponds to the 200-foot level of the new Czar shaft. The second ore body, discovered about 600 feet east of the first, was covered at the surface by 200 feet of limestone, and abruptly terminated at a depth of 300 feet from its apex. A narrow seam of ore was known to extend into the limestone to the south of the original ore body, but it was not followed until years after its discovery. Then it was found to be the connecting link between the ore body from which it sprung and another, still larger, in the southwest of the Atlanta claim. This ore body extended in depth from above the 100-foot to below the 300-foot Czar level, and on the sill floor of the latter level the stope was 200x150 feet—by far the largest opening made in any ore body. As it was of such magnificent size, we thought ourselves safe in running a long drift for 1500 feet, through limestones, from the Czar shaft, to strike it on the 400-foot level. (See Fig. 1.) On reaching the position which the ore should have occupied, none was found, nor has the extension of the ore body in any direction been discovered by diamond drill holes bored radially for thousands of feet. A drill hole pointed upwards entered the ore at 30 feet below the 300-foot level, where the ore abruptly terminated.

Disappointments of a like character have beset operations in other sections of the mine. A large body in the southern section of the mine was traced downward to a point 40 feet below the 400-foot level. A search in all directions on the level below has failed to find it. Where ore bodies are so eccentric in their size and the direction of their curves, it is often well nigh impossible to trace their extension, or be sure of their extinction, until they are being actually extracted. In searching for ore in these limestones, it is extremely difficult to interpret the signs which point to its presence, or to distinguish accidental occurrences from actual laws of deposition. The presence of ore in more than one place on the 500-foot level, and elsewhere in the southern portion of the mine, was indicated as probable by the presence of ore on the 400-foot level and the intermediate level below; but in no single instance has the ore been found on the 500-foot level where expected. In fact, nearly a mile of drifts was run on that level before any copper was encountered.

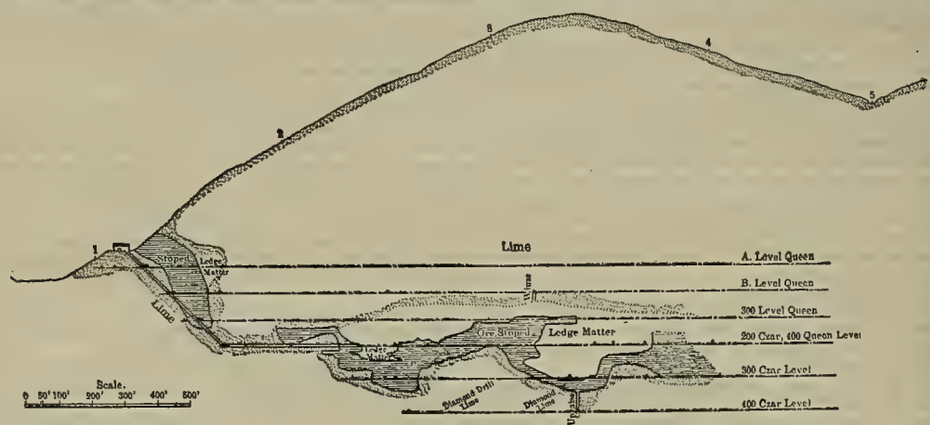

FIG. 1.—SECTION COPPER QUEEN, ARIZONA, MINE, THROUGH OPEN CUT.

Certain general conclusions have been provisionally reached. There seem to be two series of limestone beds, both of Carboniferous age: the upper bedding, recognized as the white; and the lower, as the blue—though this distinction of color is not always well marked. They dip conformably to the south, but at varying angles. At some places they lie almost flat, at others they attain an angle of over 30°. The large masses of copper, whether oxidized or unaltered, have as yet been discovered exclusively in the upper series, and only at the base of that series. Its total thickness is probably about 1100 feet, but only in the lower 300 feet has ore been found in profitable quantity. Where the series is thickest, under the apex of the Queen hill, no ore masses are known to exist. Large quantities of ore lie, as already described, under the valley where exists the obscure dividing line between the limestones and rhyolite, and where the former are probably shallow; but the largest isolated ore body yet extracted was separated by many hundreds of feet of barren limestone, and what is locally called "ledge matter," from this contact.

As we work to the southward, the ore bodies attain greater depth from the datum line of the collar of the Czar shaft. No ore has been discovered below the 400-foot level in the northerly section of the mine, whereas in the section to the south, reached by the Holbrook shaft, ore bodies have been found at 500 feet below that point, and still farther south the ore attains a greater depth. But the ore bodies hitherto encountered here are small in comparison with those explored and extracted in the northern sections.

The conclusion that the profitable ore is confined to the upper series of limestones is based on the ex-

* Condensed from Transactions American Institute Mining Engineers. Published for first time.

perience that large, compact ore bodies have not been found to extend below a certain horizon. Nevertheless, the limestones of the supposed lower series, as far as they have been explored, are more thoroughly impregnated with iron sulphides, associated with minute quantities of copper sulphide, than the upper limestones. But so little work has been done below the upper chain of ore bodies that no conclusive opinion can be formed as to the metalliferous value of the underlying limestones. There is slight probability of oxidized ore being encountered, but the general dissemination of pyrite and chalcopyrite in fine grains through the rock leads to the hope that areas of ground may be entered where the latter mineral may be abundant enough to render the limestone a "concentrating ore."

The Copper Queen mine has become famous for its beautiful specimens of carbonates, both malachite and azurite. The malachite is never found in such large and compact masses as to make it commercially valuable for decorative purposes; besides, occurring generally in thin botryoidal masses, it is usually streaked with manganese, which detracts from its purity. Its most striking mode of occurrence is in geodes, which are lined with velvetry crystals of the same mineral. These hollow spheres, the walls of which are composed of concentric layers, are rare, but, when found, are usually in nests embedded in soft, wet, ferruginous or manganiferous clays, such as constitute the gangue, or "ledge matter," of nearly all the ore; and they occur at no great distance from a limestone wall or partition. The slabs of azurite, also, usually occur near the limestone, but preferably in the manganiferous, clayey gangue. The oxidized copper ores, however, which are mined in economic quantities, consist usually of cuprite and carbonate, disseminated through limonite; or of carbonates, chiefly of the green variety, in streaks or crystals scattered through ferruginous or manganiferous clay; or of minute particles of metallic copper, with more or less cuprite crystals, disseminated through yellow clay. These yellow clays are generally more distinctly bedded than the masses of red and black clays which carry the highly oxidized copper compounds. Masses of any considerable size of native copper are found almost exclusively, not at the surface, where the oxidizing agencies have been most active, but in the deepest layers of the large ore bodies, where apparently some reducing agent has been more actively at work than elsewhere, and where the ore is furthest removed from atmospheric interference. On the sill floor of the 300-foot level (at the bottom of the great southwest ore body already referred to), native copper was abundant in masses, some of them of several hundred pounds in weight. The surface of the native copper lumps and masses is always more or less perfectly crystallized, as of course is the case in those mines where all the secondary copper ores were deposited slowly from the dissolved constituents of the original sulphides.

While selected specimens of the oxidized ores carry a very high percentage of copper, the percentage in the ore as actually mined is much lower, inasmuch as the particles of ore proper are, as explained, associated with clays or limonite; and these cupriferous clays or limonites are themselves embedded in vastly larger masses of clayey ledge matter, absolutely barren of copper. The approach to the so-called ledge matter, when drifting through limestone, is generally indicated by a softening of the rock and a gradual replacement of the lime by silicates of alumina. A series of analyses taken from a drift in the eastern section of the mine, as an ore body is approached, indicate the gradual change from unaltered limestone to clays, involving a decrease in lime from 24% to 0.33% and an increase in alumina from 2.20% to 16.9%.

The further passage from altered limestone to ledge matter is often less marked by change in composition than by change in color. The assays show the increase of iron with the increased depth of color. The altered limestone contains:

CaO.	MgO.	SiO_2.	Al_2O_3.	F_2O_3.	CO_2.
50.0	.....	8.04	3.04	1.6	38

The subjacent ledge matter:

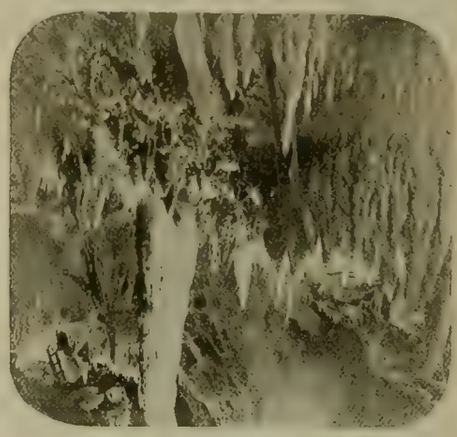
CaO.	MgO.	SiO_2.	Al_2O_3.	F_2O_3.	CO_2.
1.62	5.98	53 9	14.0	14.4	6.85

The ferruginous clays, when entered, are regarded as hopeful indications of ore, but exploratory drifts are often made in them for many hundreds of feet before reaching a trace of copper. Suddenly, without any premonition, the clay carries copper; and as suddenly the drift runs again into barren ground. Large areas have been stoped from these sporadic masses, and the locality has been abandoned as exhausted, only to discover years afterwards that a mere partition of barren ledge matter separated the exhausted stopes from still larger reserves.

As at the surface in the open cut, so occasionally in depth, the ledge matter is in contact with unaltered limestone. In other places the ledge matter has parted abruptly from hard limestone. The ledge matter is often very much contorted.

The difficulty of extracting these comparatively small masses of soft ore from such large masses of plastic clay is very considerable. The whole hill is in a state of ceaseless movement. The comparatively shallow capping of limestone is fissured to the surface in all directions, and the lateral strains on the partitions of limestone which separate the masses of ledge matter, when large stopes are made in them, cause these partitions to yield. The slag dump in the valley east of the hill rests on detritus, beneath which is ledge matter, and is a source of considerable annoyance in the mine, as its pressure is continuously squeezing up the ledge matter in the eastern stopes of the mine. And so soft is the ledge matter which is under this valley, that cone-shaped caves extend to the surface from the stopes through 80 to 100 feet of barren clay,—but fortunately the movement of ground is slow, and ample warning is given. The tendency of the clays, under this pressure, is to rise, and therefore it is impossible to maintain a perfectly level track in the permanent ways. At the same time the walls of the drifts are either forced out of line by lateral pressure from one side or the other, or the drifts are contracted by the irresistible pressure, from all sides, of the swelling ground. Hence it is impossible to use underground the most economical modes of traction.

The stopes can be held up only by timbering in square sets, and the face of the stopes can never be safely broken down ahead of the timbering. The yield of this class of ore is about 7%, after rough selection in the stopes, where about one-half the total material broken is rejected. To supplement the deficiency in filling up the stopes, barren ledge matter from exploratory drifts is used. Though the timbering of worked-out portions of the stopes is thus enforced, so violent is the movement of the ground that, when an old stope is drifted through, the old timbers are found upset and dislocated or crushed into chips. The size of timbers usually employed in square sets is 10x10 inches and 12x12 inches, and the most available source of supply is Puget sound. About 30 feet, board measure, is buried in the mine to the ton of ore extracted.



A notable quantity of oxidized ore is also obtained from narrow irregular deposits between limestone walls, or from still more undefined bodies, which cement together limestone boulders, large and small. These boulders are generally superficially gnarled and corroded, as well as decayed to a depth of several inches, and they and the ore entangled among them are never situated at any considerable distance from the solid confining limestones.

The depth to which decay of ore has extended from the surface is very variable. A very large body of sulphide ore was struck on the 200-foot level, and yet in other sections of the mines the ore is partially oxidized to the lowest depth at which ore has been encountered, namely, 570 feet below the collar of the Holbrook shaft. Yet below the 300-foot level, completely oxidized ores became scarce. The furnace mixture, for years before the company abandoned the making of bars direct, yielded a certain quantity of matte, and the copper bars were debased by a notable percentage of sulphur. The depth to which atmospheric agency reaches is, of course, determined by the permeability of certain rocks to the insensible flow of water through their pores.

The compact carboniferous limestones, however, in which the Copper Queen mine occurs, permit the passage of atmospheric agencies to considerable depth, rather through the fissures and joints (expanding occasionally into caves), by which they are reticulated than through the pores of the rock. An interesting phenomenon in the West, where the climate is so extremely dry, is the great depth to which roots will strike down through rock fissures in search of moisture.

The sulphurets in these limestones occur in layers of various thickness and solidity. When solid and thin, they are generally partially oxidized, and are rich. Two very large compact masses have been encountered, and in part explored. The largest apexes on the 200-foot level and has been traced to the 400-foot level, and a string of stopes nearly 500 feet in length has been opened upon it; but the profitable ore bears only a small proportion to the whole mass. Roughly speaking, the mass is enveloped in a shell of oxysulphide, and streaks of similar black copper ore of good grade intersect it; but the core consists of compact bisulphide of iron, very lean in copper. The same condition holds good of most of the large iron pyrites masses the world over, where oxidation is occurring; and, therefore, while estimates of quantity can generally be easily made, certainty as to value is more difficult to reach.

The genesis of these ore bodies, the progress of their decay, and the contemporaneous changes wrought in the surrounding rocks, are interesting subjects of study and speculation. During the early stages of the mine's development, the opinion was prevalent, based exclusively on the clean-cut outline of the great outcrop and the well-defined cavity of limestone in which the first ore body was enclosed, that the original unaltered ores, prior to their alteration, had filled caves previously formed in the limestone, and that this filling had been effected partly through infiltration and partly through mechanical action. The barren clays below the 100-foot level were distinctly stratified; and at still greater depths in these and other sections of the mine large, round, siliceous pebbles, isolated or in layers, are found. Further developments have shaken this hypothesis, though there is abundant evidence that, through cracks and fissures in the limestone, surface detritus has been carried to considerable depth, and that mechanical as well as atmospheric agencies have played their parts in creating and distributing the ore bodies in their present secondary altered condition. Large caves exist in the hill. It is therefore conceivable that into pre-existing caves copper solutions might have entered concurrently with mechanically transported clays and gravels, thus forming the aluminoferruginous copper ores which constitute the great mass of the oxidized bodies. But the almost total absence of lime in these oxidized ore bodies is in itself a strong argument against the supposition; for, had the copper been carried into them through infiltration from limestones and with lime, the ores would have possessed the composition of the cupriferous stalactites, which line the caves, and therefore would have contained a large proportion of lime as calcite. But this is not true either of the ledge matter or of the ores.

STALACTITES IN CAVE, COPPER QUEEN MINE, ARIZONA.

In framing a reasonable theory to account for the formation of the oxidized ore bodies, we may start with the assumption that the copper they contain existed originally as a sulphuretted compound. Another assumption, which cannot be made with so much certainty, but which, I think, may be fairly allowed, is that the composition and distribution of the unaltered masses of sulphurets, which are contiguous to the altered ores, are identical with the composition and distribution of the now oxidized ore bodies before decay had set in.

As I have already remarked, limestones contain more or less disseminated iron and copper pyrites, but these particles, protected from atmospheric action by the envelope of rock, are unaltered even at shallow depths. Not so, however, the large mass, for instance, of compact pyrites which extends from the 200 foot level to the 400-foot level. It exhibits every stage of decay, and the enclosing limestones are widely and completely altered. A section through this portion of the mine would exhibit the limestones becoming gradually softer and exchanging their lime for clay, while yet retaining the structure and color of the original rock. This altered limestone contains CaO, 7.1; MgO, 8 36; SiO_2, 27.1; Al_2O_3, 15 5; CO_2, 17%. Immediately on it lies ledge matter, the composition of which is CaO, trace; MgO, trace; SiO_2, 27.4; Al_2O_3, 15.1; F_2O_3, 33 9; CO_2, 10.6. The light, clayey, aluminous rock thus suddenly changes to a ferruginous clay, generally barren of copper. This envelope gives place to a black sulphuretted ore of very diverse composition. At places it runs very high in copper. At other places, though the same in appearance, it consists merely of an oxysulphide of iron. On the whole, however, this second shell contains the most profitable of the sulphuretted ores. It is not of uniform thickness, any more than of uniform composition, but thick enough to permit large stopes to be opened upon it. The kernel of the mass is very much leaner in copper than the shell, and consists of compact iron pyrites averaging about 45% sulphur.

On the same horizon as this particular body of both partially altered and wholly unaltered pyrites we have large quantities of ledge matter, in which occur, as already described, great masses of cupriferous limonite, while, elsewhere in the same ledge matter, we have areas of cupriferous clays. These differ from the barren ledge matter in little else than the percentage of copper. The limestones, as ledge matter is approached, have undergone substantially the same alteration as in the vicinity of the black oxysulphide.

(To be Continued.)

Electric Mine Haulage.

Written by MR. B. HARDING.

Electric mine haulage is largely adopted in the Pennsylvania and Ohio colliery districts. In these days of active competition and the imperative demand for decreased cost of production, improved appliances for cheapening the mining of coal have become absolutely essential to profitable operations. New colliery systems have felt the necessity of installing the most approved machinery for haulage, hoisting, pumping, and for general mining work. Mule haulage, traction cables, and hand labor have been largely displaced by electrical machinery.

Some engineers have questioned the economy of the electric motor, where the use of power is variable and intermittent; but herein lies one of the strongest motives for using electricity. The current can be generated at a central station, near the mouth of a mine, and be transmitted by wires to the points where power is required. Each of the mine machines uses current only during the time it is in actual operation; the electric mine locomotive when hauling cars; the coal cutters, drills and pumps while actively employed. No electric current is wasted, for when any machine suspends work it ceases to draw power from the central station.

The economy introduced by an electrical installation is well known to those who formerly used separate steam engines, and have supplanted them with

FIG. 1.—BALDWIN-WESTINGHOUSE MINE LOCOMOTIVE, BERWIND-WHITE COAL MINING CO.

FIG. 2.—OPERATING END OF BALDWIN-WESTINGHOUSE MINE LOCOMOTIVE.

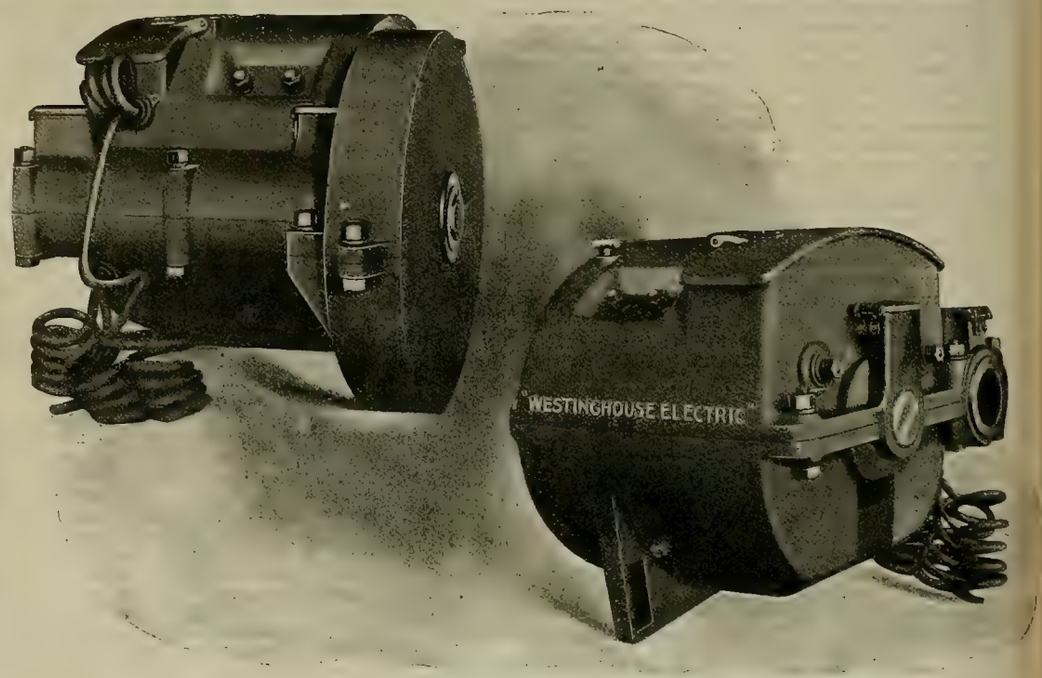


FIG. 3.—THE FIFTY H. P. WESTINGHOUSE DIRECT-CURRENT MOTORS FOR BALDWIN-WESTINGHOUSE MINE LOCOMOTIVE.

electrical apparatus. One of the largest Pennsylvania steel companies, using 7000 H. P. of Westinghouse electric motors, has recorded that the average load upon the central power station is but 15% of the amount of steam formerly used when separate steam engines performed the work. A similar economy has been found in other industries. The power used with electrical apparatus compared with steam engines is 25% to 35%, according to the nature of the employment.

In the majority of mines direct-current electricity is employed, but in fiery mines alternating current with Westinghouse type "C" motors may be used to drive mine machinery, as these motors are absolutely sparkless, having no commutator or moving contacts. Westinghouse type "C" motors are employed with perfect security in powder mills, grain elevators, and wherever there may be danger from explosion or conflagration.

Electric mine locomotives of a novel design have recently been introduced by the united efforts of the Baldwin Locomotive Works and the Westinghouse Electric & Manufacturing Co.; they are known as the Baldwin–Westinghouse electric mine locomotives. The economic use of electric locomotives in mines is admirably demonstrated in the collieries of the Berwind–White Coal M. Co., Pennsylvania. At Atlantic No. 1 mine, Houtzdale, Penna., a continuous rope haul was discarded, and a great saving effected by the introduction of Baldwin–Westinghouse electric mine locomotives. While the rope haulage was fairly satisfactory between fixed points and for short distances, yet as the headings were extended, and on account of the contour of the coal seam, the workings became crooked, the rope haulage had to be abandoned and the electric system substituted.

Atlantic No. 1 is a drift mine in the celebrated Mashannon seam. At the entrance there is an 1800-foot 3% grade against loads, and inside the mine the seam has a variable dip with a maximum of 9% against loads. The length of haul from tipple to face is two miles, divided into two haulings of one mile each. Two Baldwin–Westinghouse electric mine

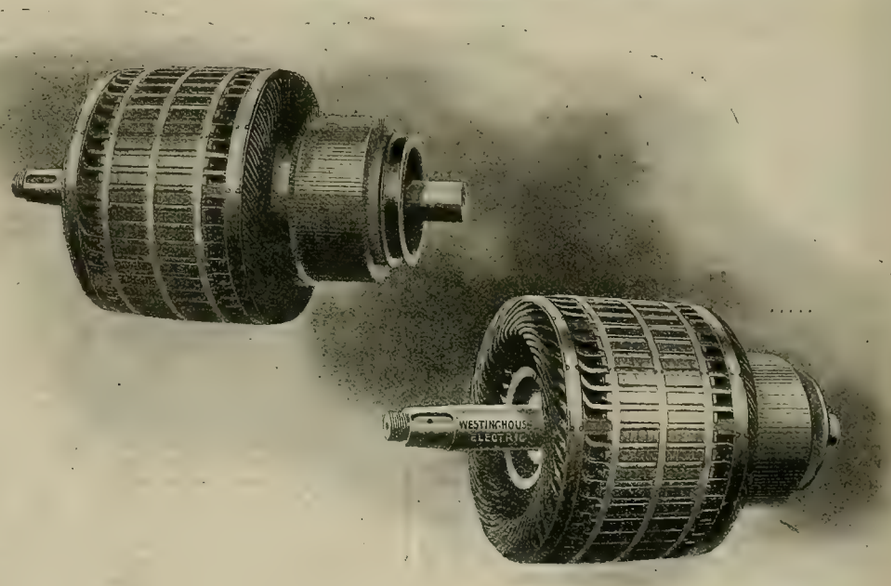

FIG. 4.—ARMATURE FOR MOTOR OF BALDWIN-WESTINGHOUSE ELECTRIC MINE LOCOMOTIVE.

locomotives—16,000 pounds each—operate the outer haul, which has a maximum of 3% against loads. Upon the inner haul, where there is a maximum of 9% against loads, there are two locomotives weighing 26,000 pounds each. Fig. 1 illustrates a 26,000-pound Baldwin-Westinghouse electric mine locomotive, class 4–2–50 C.

The heavy locomotives approach this grade under full speed—eight miles an hour—with a train of ten loaded cars, weighing gross twenty-five tons, and surmount the grade without difficulty.

The locomotives collect ten empty cars from the side tracks and distribute them to the entrances of the various rooms in the mine, returning with ten loaded cars, hauling them to the side track one mile distant. By this means one motorman and trip rider make twenty trips daily, delivering a total of 300 tons of coal at a cost of $3.75 per day. Were this work done by mules, it would require twelve mules and six drivers at a cost of $18 daily. Electric traction thus shows a daily saving in wages of $14.25 on each locomotive. The cost of feed for the mules and their care and depreciation are calculated to approximate the same sum as the operating expenses of power-house fuel, together with repairs to machinery. The coal seam in the Atlantic No. 1 mine varies from 4 to 7 feet in thickness, causing the workings to be somewhat irregular. In winter and early spring a good deal of water accumulates in the dip workings, but this has caused no interference with the regular operation of the haulage plant. The water has been removed by pumps, operated by Westinghouse electric motors, current being conveyed to the motors through the trolley wires of the haulage system. The use of steam for pumping would have greatly interfered with the ventilation of the mine.

Fig. 2 shows the operating end of a Balwin-Westinghouse electric mine machine. These locomotives are extremely compact in outline and suited to low and narrow mine entrances, the height running from 26 inches to 38 inches, and the length from 9 feet to 12 feet. The moving parts are covered and not exposed to dirt and external injury. The frame is of heavy iron, the sides and ends being firmly bolted together. The frame pieces are planed to assume perfect accuracy in fitting up and in the interchangeability of parts. The frame is placed either inside or outside the wheels, to adapt themselves to the width of the mine entrances. The driving wheels are of the best cast iron with chilled threads, pressed and keyed on the axles. Hammered iron or steel is used for the axles, which are accurately turned for the main journals and motor bearings, and key seated for gear. The journal boxes are ample in size, having bronze bearings with oil cellars for sponging, as in steam locomotive practice. Brake apparatus is fitted to all wheels; this is simple in design, and of sufficient power to utilize the track adhesion due to the weight of the locomotive. A platform for the operator is placed on either end, or on both ends. All the levers are within reach of the motorman when seated. A special feature has been made of the spring apparatus. The entire machine is supported in the journal boxes by helical springs, which avoids destructive pounding on the track, and relieves the machinery from shock, and the electric motors are separately spring-supported.

The motors of these locomotives were designed by the Westinghouse Electric & Manufacturing Co. specially for mine service. Two motors drive each machine: they are shown in Fig. 3, one geared to each axle by single reduction gearing, running in oil lubrication in tight cases. The Westinghouse motors are of the four-pole, steel clad, enclosed railway type. The armature is of the iron-clad type, the coils being held in slots below the surface, and secured from displacement in accordance with the most approved railway practice (see Fig. 4). The current controller, or starting device, is the latest rheostatic type, with magnetic blowout to prevent arcing at the contacts. It is operated by handles for starting and reversing, and is provided with various speed changes. The train is brought gradually to full speed by means of the controller. Special attention has been given to the capacity of the rheostat, to avoid overloading, as the working capacity of mine locomotives is often seriously impaired by failure to provide sufficient resistance to take care of the varying loads in switching, and light load hauling. The trolley pole is a special device, is reversible, and can be placed in a socket in either side of the frame. Baldwin-Westinghouse electric mine locomotives are built in six standard hauling capacities and to suit various track gauges, and frame arrangements. Each locomotive is equipped with two motors of ample capacity to exert the maximum draw-bar pull which can be obtained with the respective sizes of locomotives without incurring slipping of wheels. These locomotives are rated in terms of the weight of driving wheels, which is the factor determining their tractive power. The six standard sizes run from 4000 pounds to 26,000 pounds, exerting a draw-bar pull on the level, from 500 pounds for the smallest size to 4300 pounds for the largest size. The starting draw-bar pull in each case is limited only by the adhesion of the locomotive wheels to the rails, the motors being powerful enough to slip the wheels with any condition of track. The track guage varies from 22 inches for small locomotives to 35 inches for the largest size. The speed is from six to ten miles an hour.

Quartz and River Mining in Eastern Oregon.

In the issue of August 19th appeared an illustrated article from a staff correspondent on mining activity in eastern Oregon. Supplementary thereto is herewith noted the Gold Hill mill and mine, thirty-two miles from Baker City, Or., where six claims are being developed on average ore values of $16 per ton, 65% being saved on plates, the 10-stamp mill being kept in constant operation.

On Burnt river, thirty-five miles southeast of Baker City, is the Pomeroy dredger, costing $60,000, with a hull 34x100 feet, held in place by two spuds 61 feet long, each spud shod on the lower end with steel shoe weighing 3000 pounds. The thirty-nine buckets have each a capacity of 6¼ cubic feet. Seven engines operate it, there being two steam boilers. The capacity of the pump is 8000 gallons per minute. The dredger has a twenty-four-hour capacity of 2000 cubic yards, ten men operating in that time. The gravel averages from 20 to 25 cents per cubic yard; the cost of handling it is locally figured at 5 cents per cubic yard.

There is a large extent of similar placer ground, unworked, in that vicinity. The two accompanying engravings are furnished through the courtesy of Mr. O. L. Miller, of Baker City.

GOLD HILL MILL, BAKER COUNTY, OREGON.

POMEROY DREDGER, BAKER COUNTY, OREGON.

A Typical Utah Mine.

Herewith is an illustration of the Old Jordan and Galena mine and mill, Bingham, Utah, furnished through the courtesy of Mr. Higgins of the Salt Lake City *Mining Review*. The mine is a good example of the kind of properties that have put Utah in the front rank as a dividend producer. Though not worked or even explored below the 200-foot level, vertically, the past output is estimated at over $20,000,000, it producing gold, silver, lead and copper, new ore bodies now being blocked out and new development going on preparatory to resumption of ore extraction.

The Old Jordan is probably the oldest location in Bingham district. It was 200 feet wide, 5200 feet long, and was located in 1863 by a soldier in the command of Gen. Connor. It is said by some to have been the first mineral location in Utah, and proved immensely rich from the surface. The U. S. M. Co., represented by Capt. R. A. Parker of San Francisco and J. W. Neil of Salt Lake City, has recently secured and consolidated three leading properties in Bingham, one of which is the Old Jordan and Galena, which apart from its past and prospective value is of historic interest.

OLD JORDAN AND GALENA MINE AND MILL, BINGHAM, UTAH.

THE coast glaciers of Alaska appear to have lost their scenic attractions for the time being through the occurrence of the recent earthquake. The Foster glacier in Taku Inlet was fractured and the overhanging portion slid down into the water, so that instead of the bold projection on the seacoast, it now affords a gentle ascent. Other glaciers suffered to an equal degree.

ZINC miners of the Missouri–Kansas field have closed a number of their mines, as the smelting association refuses to pay the price demanded by the miners. The smelting companies want to pay dividends on their excessive capitalization, but are unable to do so while paying the miners' price for ore. The latter claim that a profit of $14 to $16 per ton, sought by the smelters, is exorbitant, while their price for blende is reasonable, and to maintain it they have curtailed production.

The New Africa.

Much additional information has recently been brought to the surface regarding Africa through the opportunities which are now afforded for access to the interior. Physically, the African continent is in many respects unique. Five thousand miles in extreme length, and over 4000 in breadth, its area is greater than that of any other continent except Asia, the latest estimates being 11,874,000 square miles. Its coast formation is peculiar in the absence of deep indentations, bays or harbors, and the small number of waterways which offer entrance to the interior. The fact that the greater part of the interior is an elevated table-land, extending on all sides to within a short distance of the coast, renders access to the interior by the few large streams difficult. At the point where the rivers pass from the elevated plateau of the interior to the lowlands of coast the falls or rapids which there exist prevent navigation, and, as a result, travel to the interior in Africa developed more slowly than in any other continent. Indeed it was not until the explorations of Livingstone, Stanley, Spoke and others developed the true conditions and made known the fact that vast navigable water stretches were to be found in the interior that it occurred to man to transport steam vessels around these falls and put them afloat in the waterways of the interior. When these conditions were clearly established, however, modern ingenuity and energy soon found a means of transporting steamers in small pieces upon backs of men through the forests, around the falls and rapids for scores and even hundreds of miles, and putting them together, set afloat the steamers which penetrate thousands of miles into the interior and develop facts never before known and which could not have been developed by land exploration in tropical climates and jungles for many generations.

Already railroads run northwardly from Cape Colony about 1400 miles and southward from Cairo about 1100 miles, thus making 2500 miles of the Cape to Cairo railroad complete, the intermediate distance being about 3000 miles.

Progress in Metallurgy.

W. R. Austen notes that there are blast furnaces which will produce 690 tons of pig iron in twenty-four hours, with a consumption of little over 154 cwt. of coke per ton of iron, and the gases of blast furnaces are used not only as sources of heat, but directly in gas engines. There are Bessemer converters which can hold fifty tons, while 100 ton furnaces are projected. The open-hearth furnaces are fed with one ton of material in a minute, by the aid of a large spoon worked by an electro-motor There are gigantic "mixers" capable of holding 300 tons of pig iron, in which, moreover, a certain amount of preliminary purification is effected. Steel plates are rolled of over 300 feet in area and 2 inches thick, and there are girders which justify the belief of Sir Benjamin Baker, that a bridge connecting England and France could be built over the channel in half-mile spans. There are ship-plates which buckle up during a collision, but remain water-tight. There are steel armor-piercing shot which will penetrate a thickness of steel equivalent to over 37 inches of wrought iron. The points of the shot remain intact, although the striking velocities are nearly 2800 feet a second. There are wires which sustain a load of 170 tons per square inch without fracture. Hadfield, whose labors he hoped to see continued far into the twentieth century, has given us manganese steel that will not soften by annealing; while Guillaume has studied the properties of certain nickel-steels that will not expand by heat, and others that contract when heated and expand when cooled. Nickel, chromium, titanium and tungsten are freely alloyed with iron, and the use of vanadium, uranium, molybdenum, and even glucinum is suggested. Huge ingots are placed in soaking pits and forged direct by 120-ton hammers, or pressed into shape by 14,000-ton presses, and there are steel castings that weigh over thirty-five tons.

THE Pikes Peak Power Company is at work on the installation of a 3200 H. P. plant on Middle Beaver creek in Colorado, which will supply current to the Cripple Creek district electric railway and also certain mines in the neighborhood. About 150,000,000 cubic feet of water will be impounded at a height of 2300 feet above the impulse wheels in the plant. It is expected that current will be turned on in about six months.—Electrical Review.

JOHN F. QUINN, foreman of the railroad section crew at Corning, Cal., received a shock of 10,000 volts of electricity last week from the wires of the Tehama Electric Company. He was lifted from his feet and left in a paralyzed condition. His body was badly burned and he is still in a demoralized nervous condition, but will recover.

California Canal Construction.

Recently were given some illustrations of the headworks of the Merced, Cal., canal and some facts of the history of the enterprise. As one of the large enterprises for water distribution, a few more details from the report of C. E. Grunsky to the U. S. Geological Survey may be of interest. One of the features of the work is a large tunnel which, owing to the nature of the soil traversed, had to be turned into a subterranean flume. When the canal reached a point eight miles north of Merced it was taken through a spur of the foothills in a timber-lined tunnel 20 feet wide, 13 feet high and 2100 feet long, with a total fall of about 5 feet. Tunnel frames are constructed of timbers, 12x14 inches, 4 feet apart. Lagging and flooring are 3 inches thick, all redwood. Tunnel lining required over 1,000,000 feet of timber, and it alone is said to have cost about $30,000. Mr. Grunsky thinks it is extremely doubtful whether the reduction of a few miles in the length of the canal could justify its construction, even if it had been found to require no lining. The total cost of the tunnel was about $70,000. It was completed in about six months. The other engraving shows a scene on the main canal near its exit from the diversion works at the dam. It shows one thing which is characteristic of the canal through portions of its course and that it traversed much distance through a soft sandstone or a cemented gravel which allows a nearly vertical bank. At the place shown the canal is about 60 feet wide and it has a fall of about 1 foot to the mile, except at the tunnels. One of the rock tunnels has a fall of 10 feet to the mile and the lined tunnel shown in the upper engraving has half that fall.

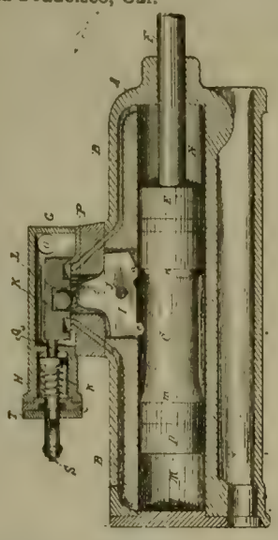
Steel at Liquid Air Temperature.

M. F. Osmond recently contributed to the *Academie des Sciences* the results of some experiments made on steel at the very low temperature produced by the evaporation of liquid air. In 1890 the late Dr. Hopkinson discovered that steel containing 25% of nickel, which was non-magnetic at ordinary temperatures, became magnetic at the temperature of solid carbonic acid. M. Osmond also found out that this property is inherent in other alloys of nickel when carried to the lower temperature of liquid air, and concludes that the hypothesis of Hopkinson, which assumes the existence of a definite alloy—Fe_3Ni—is not correct.



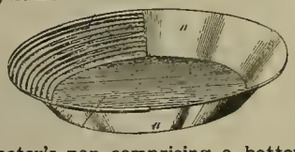
THE Kimberley diamond mines, which are located in British territory just outside the boundaries of the Orange Free State and about 600 miles from Cape Town, now supply about 98% of the diamonds of commerce, although their existence was unknown prior to 1867 and the mines have thus been in operation but about thirty years. It is estimated that $350,000,000 worth of rough diamonds, worth double that sum after cutting, have been produced from the Kimberley mines since their opening in 1868-69, and this enormous production would have been greatly increased but for the fact that the owners of the various mines in this vicinity formed an agreement by which the annual output was so limited as to meet, but not materially exceed, the annual consumption of the world's diamond markets. Diamond digging in other parts of the world has almost ceased.

Latest Mining and Metallurgical Patents.

Patents Issued Oct. 3, 1899.

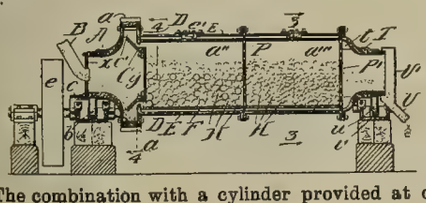
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ROCK DRILLING MACHINERY.—No. 633,692; W. Gleeson, San Francisco, Cal.



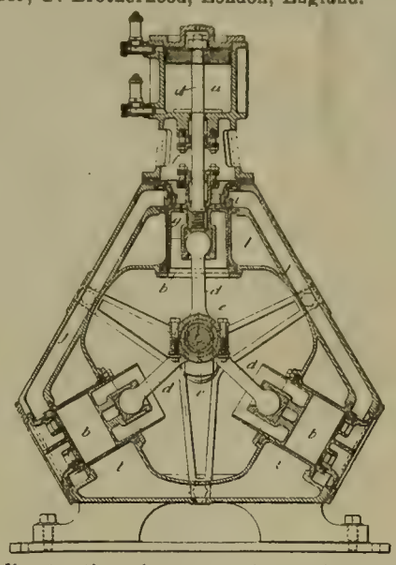
In a rock drilling machine, a main cylinder, a piston, a distributing valve for air or steam, a tappet to move the slide valve each way, and a stem pressed elastically against one end of the slide valve by means of a spring, whereby the valve will move in one direction in advance of the tappet's action, and produce short strokes of the piston and of the drills attached thereto, a spring to move the slide valve in one direction in advance of the tappet's action, and means to apply and remove the pressure of the spring, whereby the operation can be instantly changed from a long to a short stroke, and the reverse.

MINE CAR CHECK HOLDER.—No. 634,049; C. R. Williams, Georgel, Va.



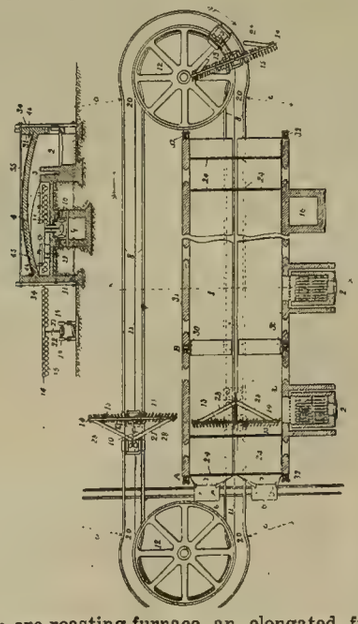
A mine car having an attached check holder provided with a check seat, from which a check may be dislodged by the movement of the car to a discharging position, and having means for preventing dislodgment when the car is in its normal position. A tally check holder for tilting receptacles, having a depressed check seat accessible to a check when the holder is in its normal position, and from which a check may be dislodged when the holder is in a tilted position, and having means for preventing removal of the check when the holder is in its normal position.

PROSPECTOR'S PAN.—No. 634,120; W. H. Moore, Deadwood, S. D.



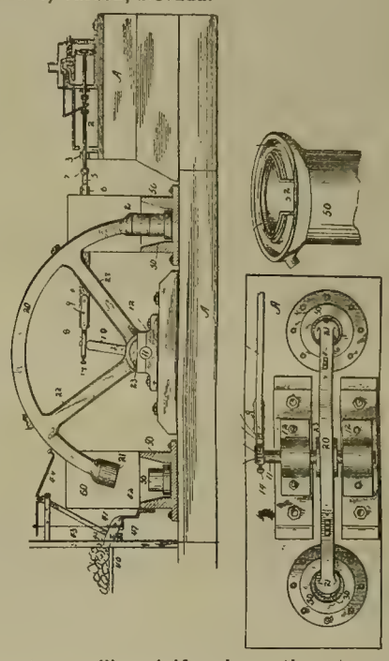
A prospector's pan comprising a bottom and an outwardly flared rim rising from the bottom, approximately one-half the circumference of the rim having a smooth inner face from the bottom to the top thereof, the other half or portion of the rim having a series of horizontally disposed corrugations on its inner face, the corrugations extending from the bottom of the pan to the outer edge of the rim, forming a riffled surface.

PULVERIZER.—No. 634,254; R. Yates, St. Louis, Mo.



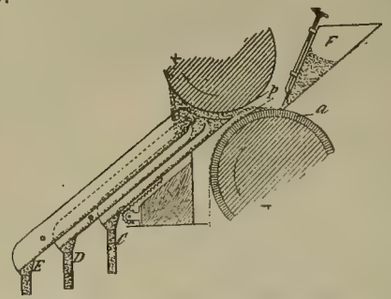
The combination with a cylinder provided at one end with a securing flange, of a hollow head *A* having a bearing portion by which it is supported and a flat clamping portion, a flaring ring *C* arranged in head and having plates *c'* projecting beyond the same and between clamping portion and securing ring, means for clamping securing flange and head together for holding the ring *C* in position, external means engaging bearing portion of the head for rotatively supporting the same, and means for rotating the head and cylinder.

DIRECT-ACTING AIR COMPRESSING ENGINE.—No. 634,389; P. Brotherhood, London, England.



A direct-acting air compressing engine comprising a double acting steam cylinder having its piston connected to the piston of an air compressing cylinder in line with the steam cylinder, and two other air compressing cylinders having their pistons connected to the same crank with the other and the air cylinders being provided on their outer ends with apertures furnished with suitable suction and discharge valves. The combination with a shaft, and a plurality of radially arranged air compressing cylinders having their pistons connected with the the shaft, of a double acting steam cylinder having its piston rigidly connected by a piston rod with the piston of one of air compressing cylinders.

ROASTING AND OXIDIZING FURNACE.—No. 634,247; A. Ropp, Selby, Cal.



In an ore roasting furnace, an elongated furnace chamber provided with a roasting hearth and conduit beneath; a series of rakes or rabbles connected by an endless rope, located in the conduit, and impelled by wheels or pulleys at the ends of the furnace, rakes or rabbles being supported and guided by cars or trucks mounted on ways beneath and outside the furnace, each of the ways having a double or reverse curve and increased radius around the wheels or pulleys, so that the impelling rope will enter upon and leave the guiding and driving pulleys without lateral strain. A main hearth and fire boxes communicating therewith; a series of mechanically impelled rakes or rabbles to stir and move the ore, rails or ways in a conduit beneath the hearth of the furnace and extending beyond the ends thereof and having reverse curves in the extended portions, and cars or trucks carrying the rakes or rabbles, the car or truck wheels being provided with swiveling axles to accommodate the curves at the ends of the furnace. A hearth, reverberatory top and side walls, the hearth, reverberatory top and side walls being divided into separate sections, each of which is braced by through rods or bolts and metallic bars 30 that will telescope or slide one upon the other, permitting longitudinal expansion and contraction of the walls of each section. A hearth, reverberatory top and side walls in divisions, and plates 30, 38 and 45, to cover the spaces between the divisions of the hearth, side walls and top, the plates being attached to one division of the furnace and adapted to slide on the other division, whereby the hearth, top and side walls may expand and contract together. A plurality of separate ore-roasting furnaces, each provided with doors at its ends, the furnaces being arranged in alignment and each provided with a way; in combination with an endless carrier passing through and common to all the furnaces of the plurality; a stirring mechanism operated by the carrier, and suitable supports for the carrier. A plurality of separate ore-roasting furnaces, each of which has its hearth slotted from end to end; closing doors at each end of each hearth arranged to be actuated by the stirring mechanism; a carrier supported below the slot and common to and passing through the slot of each furnace; stirring mechanism operated by the carrier, and supports at the ends of the plurality of furnaces and at suitable intermediate points for supporting said carrier.

STAMP MILL.—No 634,417; A. C. Pratt and C. A. La Grave, Carson, Nevada.

In a stamp mill, a rigid reciprocating stamp supported on a journaled shaft and provided with shoes at each end, a mortar and die on which the stamp may strike a blow at each end of the reciprocating movement, and means for starting the stamp bar, then releasing the stamp bar and permitting the momentum of both stamps and bar to become available in the blow at either end of the bar.

ELECTROMAGNETIC APPARATUS FOR SEPARATING ORES.—No. 634 356; E. Kreuser, Mechernich, Germany.

An electromagnetic ore separator, consisting of two revolving, cylindrical electromagnets arranged one above the other and having cylindrical polar surfaces, the rotation of which produces a magnetic field bulged in the direction of rotation, a cylindrical, non-magnetizable covering tightly fitting the lower cylindrical polar surface to weaken its magnetic attraction relative to that of the upper cylindrical polar surface which raises the ore particles consecutively through polar fields of gradually decreasing strength, and inclined chutes arranged to correspond accurately with the several zones of the separated falling ore particles; and conveying away the different grades of ore as they are separated from each other by the magnetic attraction of the upper cylindrical polar surface.

Mining Summary.

ALASKA.

Juneau *Mining Record*: Late arrivals from George creek report a rich quartz strike in that district; the quartz shows free gold. George creek is near Windham bay and is one of the latest discoveries.

ARIZONA.

GILA COUNTY.

The Old Dominion M. Co. are reported making arrangements to float enough treasury stock to build ten miles of railroad and to pay for a converter and concentrator.

GRAHAM COUNTY.

The Arizona Copper Co. at Clifton have recently installed a 54 H. P. gasoline engine, and are making other additions to the plant.

Recent development on the property of the Morenci Copper Co. has exposed a body of ore 7 feet wide, averaging 24% copper, $20 gold and sixty ounces silver to the ton.

MOJAVE COUNTY.

While cutting into the foot wall of the De la Fontain mine last week for the purpose of putting in wall plates upon which to hang ladders, a 3-foot streak of solid lead ore was opened up. The contractors in sinking the shaft had gone over the hanging wall and failed to catch the ore where it formed on the foot wall.

The Tennessee mine is shipping twenty-five tons of concentrates daily. Large bodies of ore have lately been encountered. The ore in the Tennessee has nearly doubled its silver value with depth.

At Chloride in the Minnesota shaft at a depth of 250 feet the vein has opened out into a body of ore that assays twenty ounces gold and 300 ounces silver per ton.

Kingman *Miner*: H. J. West, F. L. Smith and G. W. Koster, while prospecting in the Boundary Cone country, located several claims. They found indications of water in a vein near the camp, and sunk outside the ledge. Water was encountered and the discovery made that the ground was held by others. The ground was bought for a nominal sum and the shaft sunk 40 feet, where a supply of water was obtained. Cutting into the ledge to increase the water supply discovered 18 inches of eleven-ounce gold. The former owners had a small stringer of rich ore on the surface, but it had pinched out, and they quit. The ledge is 4 feet wide, and everything between the walls will pay to mill. The owners contemplate putting in a cyanide plant, and are now developing water on the mines.

PIMA COUNTY.

Globe *Silver Belt*: A strike is reported from the Helvetia mines, thirty miles south of Tucson.

PINAL COUNTY.

(Special Correspondence.)—L. C. Ferree of Denver and L. H. Hollister of Boston are developing the Catalina group in the Santa Catalina mountains, near Oracle. It is asserted that they have a ledge of copper ore whose outcrop has an extent of 8000 feet. It is being operated through a crosscut tunnel 208 feet long. The ledge is 30 feet wide, with carbonates near the surface and sulphides below. The values are given as 6% to 10% copper, $2 gold, with small silver values. It is ultimately their intention to erect a small matte smelter there.

Oracle, Oct. 9th, '99.

YAVAPAI COUNTY.

The shaft on the Zonia mine, in Kirkland valley, is down 170 feet, and the showing of ore is encouraging.

Prescott *Courier*: The first carload of matte from the Big Bug smelter carried 55% to 65% copper and the last 73% copper. In addition to the copper there are gold and silver values.

CALIFORNIA.

Alpine.

Folsom *Telegraph*: J. E. Meylett, who prospected in this county during the summer, found a deposit of copper, the extent of which is not yet known, but croppings indicate a large body of ore. Specimens of the croppings are rich in copper.

Butte.

Marysville *Democrat*: The Yuba River Gold Dredging Co. have bought $1400 worth of lumber with which to build a new dredging boat for work on the Yuba river near Smartsville. The company has leased the claim of the Marysville Tunnel & Quartz M. Co.

Calaveras.

The shut down of the Utica and Stickle mills at Angels will last for about five weeks during which time the ditch will be cleaned out and the electric motors installed. The mine will be kept free from water in the meantime.

Stockton *Independent*: At the Lightner mine in Angels the second twenty stamps have been started. So far the mine has developed well with depth. Twenty concentrators are running in the mill.——Good reports come from the Harris or Bonanza mine, south of Angels, largely owned by Stockton men. A rich shoot of rock was recently struck, and the vein matter is 40 feet wide at a depth of 200 feet.

San Andreas *Citizen*: The Commodore shaft is down 240 feet and Supt. Clary is sinking on the incline on the foot wall. It is his intention to go 200 feet more before crosscutting. Crosscuts at 80 and 200 feet encountered the vein on both levels. The vein is 6 to 8 feet wide and shows an average value in free gold of $5 to $6 and 10% sulphurets, averaging $60 to the ton. Mr. Clary bonded this mine six months ago, making the last payment on Saturday. He is working three shifts. The workings are in serpentine and black slate, in ore similar to that of the Utica-Stickle mines. ——Near Middle Bar, on the Vorlander mine, they are sinking 100 feet and contracting for 200 feet more. The Kramer mine, recently bonded by C. M. Burlson, on a six months bond, for $8500, to Eastern parties, is being worked. A tunnel has been run 1200 feet and work is progressing. J. K. Carpenter, of Cleveland, Ohio, is Supt. The Empire's tunnel is in 900 feet, and on the Boston they are keeping the mine free from water, by steam power, and will resume sinking when the supply of water permits.——The new furnace of the Penn Chemical Works, at Campo Seco, is at work and giving satisfaction. After being first blown in it chilled, but on retrial it worked to perfection. Ten men are employed by the company.——The Chili Hill gravel mine, near North Branch, will be started up as soon as a supply of water is assured. A bedrock tunnel has been run to connect with the incline, and the incline has been sunk 250 feet. D. McM. Palmer is Supt.

Mokelumne Hill *Chronicle*: D. Grant, formerly Supt. of the Con. Virginia, of Virginia City, will act as Supt. of the Melbra quartz mine at Chili Junction. It was recently sold by Mrs. P. B. Whitfield to a company of San Francisco capitalists. The preliminary work is now being rushed and sinking on the property is to begin.

Del Norte.

(Special Correspondence.)—A ledge of fine copper ore has been discovered on the old Occidental, near the Low Divide.

L. W. Musick is developing copper prospects on Myrtle Creek hill, a favorite locality for prospectors.

W. L. Higgins and J. White have sold their copper claims near Preston's Peak to parties who are now in that vicinity looking for a site for a smelter.

Crawford, Baily & McGowan have struck a ledge of copper ore on the Copper King claim on Myrtle creek. At last reports they have crosscut 14 feet and were not yet across the ledge.

Lewis & Jenkins are preparing to work their ledge. A test run on tailings showed good results.

The Jones Creek M. Co., it is reported, have sold out to a Chinese company.

F. Lind is preparing for extensive operations on French hill this winter, also B. Humiche on Craigs creek. Both are laying in supplies for winter.

Crescent City, Oct. 5th, '99.

El Dorado.

El Dorado *Republican*: A miner prospecting near the Union and Crown Point mines recently found specimens of native copper and copper ore. He has a shaft down 30 feet, where the deposit is 14 feet wide. The copper ores are found in the same locality. The mine has been bonded by El Dorado county mining men.

Fresno.

Marion Childers & Co. are preparing to put in an hydraulic elevator on their placer claim on Sycamore creek. They have completed ten miles of ditch and have 130 feet head, with at present 50 inches of water, which will be increased by the winter rains.

The Copper King mine, fourteen miles from Sanger, has 20,000 tons of ore on the dump, which contains gold and silver. The ore is chalcopyrite, with an admixture of pyrite. Stoping and drifting have been discontinued while sinking the shaft deeper—now down 400 feet. The mine is equipped with a 100 H. P. hoisting plant. The workings have proven some portions of the vein to be 12 to 14 feet wide, but little crosscutting has been done. The ore runs $12 to $50 per ton.

In Fresno county are ancient river channels which come from the high Sierra in a southwesterly direction. They are covered with a heavy deposit of tufa and augite andesite. The gravel of the river beds is from a few inches to 300 feet in thickness, and contains fine gold throughout. This gold is high-grade, being worth $20 an ounce. No extensive exploration on the bedrock of these old channels has ever been undertaken and little is known of their value, from a commercial standpoint. These channels with the lava cap form long, high, nearly level-topped ridges, and are known as the table mountains. They are intersected by the San Joaquin and Kings rivers.

M. J. Donahoe has built an 18-foot overshot wheel at the Vincent Moore mine, sixteen from Sanger. The wheel runs two arrastras having 10-foot basins, the power being applied by belt to a shaft on which are keyed two pinion wheels engaging spurs on the arrastra posts. The arrastra drags make five revolutions per minute and their combined capacity is 1600 pounds of hard quartz daily. The quartz is broken to suitable size by hand hammers.

The Barnes M. Co. are preparing to work a mine on Big creek, a tributary of Kings river. The company own 3000 feet on a vein having an average width of 14 inches. The development consists of a tunnel on the vein in 320 feet, with 200 feet back at the face. The ore is oxidized and contains gold in a very fine state of division. Masses of solid sulphide ore (marcasite) occurring from time to time indicate the character of the ore in depth. The mine has a 5-stamp mill and a cyanide plant is to be built. M. J. Donahoe is Supt.

Kern.

A discovery of petroleum is reported north of Garlock and west of Searles marsh.

Randsburg *Miner*: The Kinyon mine shipped 216 ounces of bullion, about $3600, from a run of nine and a half tons of ore from the Good Hope, milled at the Kinyon mill in Randsburg. This averages nearly $380 per ton.

Mariposa.

(Special Correspondence).—About seventy-five men are working on the Mariposa Grant, divided between the Mariposa, Princeton, Josephine and Pine Tree mines. New machinery for the Mariposa mine, at Mariposa, is on the ground.

The Quail M. & M. Co. are dropping four stamps on their recently purchased property in Indian gulch, northeast of Coulterville.

H. H. Clark has sold a controlling interest in the Alice Clark mine to local and Stockton mining people. A new hoist and mill have been shipped to the mine.

Capt. A. H. Ward and associates have a bond on the Hite property, at Hite's Cove, and a strong combination has been formed to reopen the property, which many years ago was one of the richest gold producers in the State.

W. Jones, representing Tuolumne people, has secured an interest in the Kirchoff mine, on Maxwell creek, and is erecting there the old Red Cloud mill.

The Columbus M. Co. has cut a 4-foot vein in its lower tunnel and is drifting on it with three shifts. Work is progressing on the upper tunnel, which is now in 300 feet. A mill is to be erected this fall.

M. McCrosson has transferred his bond on the Siegelsteyl property to A. H. Ward.

The Merced mill is still running the full forty stamps, with enough water in the reservoir to last thirty days longer. In Tuolumne county about twenty men with a sawmill are getting out lumber to rebuild the flumes on the Oak Flat ditch, where the Merced people expect to install an electric plant next year.

A few men are still working at the Big Betsey. The management hope to yet pull out even by securing additional claims. The stock has recently been pushed in Philadelphia with a prospectus similar to the one which was circulated in the farming districts of California last year.

There are more prospectors in the hills of Mariposa county now than at any time in the last five years.

A report is current that a strong Scotch combination has an option on the McCrellish properties, now the largest idle property in the county.

The Mariposa Con. G. M. & El. P. Co. has been incorporated in Colorado by Pennsylvania and California people to operate a group of mines near Coulterville and erect an electric plant on the Merced.

Coulterville, Oct. 9th, '99.

Nevada.

The Boston Stock Exchange has admitted to the regular list 250,000 shares, par $10, of the North Star Mines Co., incorporated under New Jersey laws with an authorized capital of 500,000 shares. The company paid its last dividend in April and will shortly pay another. It is the intention to pay 5% dividends until the deeper workings are reached. The company has large quantities of gold ore which averages $18 per ton. The mines are in the vicinity of Grass Valley.

This company was organized to succeed a gold mining company organized under the laws of California and known as the North Star M. Co., which has paid $550,000 in dividends—the last of $50,000 in April, 1899. The new company gave 200,000 shares of their stock for the property and assets of the old company and sold 50,000 shares for cash at par to provide capital for improvements and operating. The three principal mines are the North Star, New York Hill and Massachusetts Hill. The North Star mine has been operated for many years and has produced $5,000,000—the ore in general averaging $17 per ton. The New York Hill has produced several million, and is now producing $30,000 to $35,000 monthly, at a profit of $10,000 to $15,000 from the deeper workings. The mines are well equipped and have a capacity of 2000 to 3000 tons per month. The new company will develop the property at a greater depth, and are sinking a new vertical shaft called the Central, which is expected to cut the North Star vein at a depth of about 1000 feet, and the New York Hill at about 600 feet.

Grass Valley *Union*: After a shut down of nearly a year the pump at the Gold Hill mine was started last week. At the same time the 350 H. P. motor was put to work.

Placer.

(Special Correspondence).—The pocket of Messrs. Clark & Brown, on the old California, still continues to yield the precious metal.

Mr. Cook will send out some ore for reduction, as well as Mr. Henderson. They have some fine ore.

Copper properties are being looked after and find ready sale, provided owners do not want too much for them.

Bruner & Hirsh are making improvements in the road between Cisco and Old Man mountain—Carlisle—having had a force of men on nearly the entire season.

Cisco, Oct. 5th, '99.

Placer.

Colfax *Sentinel*: The extension of the main tunnel at the Eureka Consolidated drift mine near Michigan Bluff, on the Forest Hill divide, was recently commenced at the 3000 foot mark. On Oct. 4th, 66 feet of new tunnel had been driven. The rock is of average hardness and they are making 5 feet per day. The tunnel is being run to tap the lower gravel channel. Felix Chappellet, Jr., is Supt.

Plumas.

Quincy *Independent*: The Thistle mine is being opened by a third hole, which, when down to bedrock, should determine the level at which a tunnel may be driven into the gravel. The boring machine is employed to locate the different levels of the bedrock, and not in prospecting for gold.——The Little Onion Valley shaft is down 125 feet. When a depth of 150 feet is reached a drift will be run to the ledge, and from that level a shaft will be sunk 50 feet.

San Diego.

Wilhite and Hill, ranchers, recently found a vein of ore near Valley Center and have opened an ore deposit 12 feet wide between walls of granite and mica schist. The ore is galena, carrying gold and silver. A large number of claims have been located in the neighborhood. The ore would have to be crushed and concentrated, as the lead sulphide is disseminated through the gangue.

The deposits of kaolin discovered a few months ago by C. E. Stream are said to be as valuable as any other kaolin beds in the United States. Stream sold the deposits a few days ago to Earle & Morgan and Fuller & Riall of San Diego and Holcomb & McCarroll of Yuma, Ariz. The kaolin owned by these parties is embraced in sixteen claims, and other claims are owned by individuals in the immediate vicinity. Some months ago Mr. Morgan took samples of the kaolin to Japan, where pottery manufacturers made a test, and he was asked to quote prices on 1000 tons a month delivered in Japan. Large quantities have been given a fire test, after pulverization, and the clay has come out as white as snow and with all the valuable qualities desired. The owners are stripping 100 feet square and will build a chute down the north side of El Cajon mountain, a distance of 1600 feet, and from the chute it is four and a half miles to the railroad at Lakeside.

The Golden Cross mines, twenty miles northwest of Yuma, Ariz., are the largest producers of gold bullion in southern California. There are thirty claims in the group, which is owned by the Free Gold M. Co., a Nevada corporation, which succeeded the Golden Cross M. & M. Co. The mines were sold to the former company for something near $1,300,000, and there is yet due on the mines about $1,050,000. The stock of the Golden Cross M. & M. Co. is owned by G. G. Mullins, Pres., and T. S. Fuller, Sec. and Gen. Mgr., of Los Angeles, and W. V. and C. L. Hedges of Omaha. The Free Gold M. Co. is owned by Isaac Trumbo, formerly of Salt Lake, Utah, but now a resident of San Francisco. The property is now in the possession of Mr. Trumbo, as receiver, and the representative of a board of control, consisting of D. M. Delmas, J. Chandler, Isaac Trumbo, T. S. Fuller and D. T. Hedges, which board represents the owners, and which will control the operation of the property. There is a mill of 100 stamps that has been running over three years. There is also a 40-stamp mill on the property that is run part of the time. Water for the mines is pumped from the Colorado river, twelve miles away. The pumping plant cost $70,000. The mines are paying about $150,000 a year. A cyanide plant is to be put in to treat the tailings, of which there is a large amount. There are three mines now being operated, development work having reached a depth of 700 feet. At one place the ore is quarried from the side of the mountain. About 150 men are employed by the company, the payroll being $10,000 a month.

San Diego *Union*: The Dulzura mining district is thirty-two miles southeast of San Diego and twenty-two miles west of Campo, and has some promising prospects. The ore is found in felsite, the dyke being from 100 to 300 feet wide on the surface. The deepest work is down 160 feet, on the Golden Chief mine, owned by the Donahoe Bros. The pay shoot averages $6 to $9 to the ton. The mine has been bonded.

Shasta.

(Special Correspondence).—Near Muletown Banter & Herzinger are doing extensive development work on three claims known as the Emma Mable group. In a tunnel 200 feet long, on the vein, the ore body is 30 inches wide and assays $35. In a shaft 30 feet deep the ore body is 4 feet wide and assays $115. In another shaft the vein is 5 feet wide and yields $12 a ton. Each piece of work is on a different claim.

The D. D. & K. mine, near Shasta, is yielding good ore in the prospecting work. From local and Selby assays, ten in all, an average of $62 per ton was obtained. A tunnel 380 feet runs on a 5-foot ledge. The formation is diorite and talcose schist.

On the Beeson group of three claims, near Middle Creek, work continues on a ledge varying from 2 to 4 feet; the ore mills $7.50 and the sulphurets assay $12 a ton. The formation is locally known as slate and porphyry.

Kahny & Burgbacher have bonded to H. C. Woodrow of St. Louis, Mo., the Bowry Belle group, comprising seven claims, with mill site and water rights, for $40,000. The option runs to Jan. 1st, 1900. The owners continue development and shipments of ore. Ten men are employed. The tunnels aggregate 600 feet. The ore body averages 30 inches in width, is low grade and free milling.

The Balaklala group of copper mines, near Copley, comprising fourteen claims, which has been in litigation for a long time, has been taken from the market. The property has been bonded to W. A. Temple for $200,000. Development will be resumed and a large force employed.

Redding, Oct. 10th, '99.

The title to the Balaklala mining property in the Flat Creek district was cleared on Monday and the sale of the property is now probable. The Balaklava is a group of copper claims ten miles northwest of Redding. A corporation known as the Balaklava M. Co has bought out all the dissatisfied owners. The three last plaintiffs to the action were bought out for $12,000.

Redding *Free Press*: H. C. McClure bonded the Recorder mine, at Copper City, recently, to H. C. Woodrow and C. C. Bush, Jr., for $10,000.——A strike has been made at Iler Bros.' mine, north of Shasta. From the 1000-foot tunnel, the face of which shows an 11-foot ledge, a shaft has been sunk into a body of sulphuret ore showing free gold. —— F. and G. Iler recently disposed of a half interest in all their mining claims included under the name of the Iler Bros.' mine to the Elizabeth G. M. Co.——The Uncle Sam G. M. Co., at Kennet, has delivered to the Pacific Development Co. at Redding, for shipment to the California Paris Commission, two handsome specimens of ore.——C. H. Woodrow, operating the Trinity group of quartz mines on Dog creek, states that the Advance M. Co. is preparing to run an 800-foot tunnel on their property. A quantity of good ore is already on the dump and the cyanide plant has started work.——The Misses May and Clara Fowler have donned miners' garb and are working a rocker on one of the Van Ness claims, near Redding, and are said to be making $4 per day.——The air drills which have been used at the LaGrange mine, owned by the French Co., have been

moved to the Black Diamond mine, on Stillwater, and will operate there in the mile tunnel which is to open on Pit river.——Since the opening of a vein of rich sulphurets at the time of the purchase of the Oro Fino by Behrens & Leivsay in the summer, the 60-foot shaft has been extended on the 2-foot ledge to 110 feet, where the ledge has widened to 3 feet and the value of the ore improved. It is a vein of almost pure sulphurets. Eleven tons of Oro Fino Ore, mined in the course of development, were shipped to Keswick.

Siskiyou.

Yreka *Journal*: The Wheeler M. Co., working the claim at the Nehrbass place, adjoining the Greenhorn blue gravel mine, have an immense quantity of water to contend with, but the two pumps are able to handle it. The shaft is down in the deepest place, and it is believed an old deep channel has been found. ——At Quartz valley the miners are getting out good quartz from three or four mines, and prospecting is going on in other claims. The work of getting out gravel for sluicing when the winter rains commence is also carried on in Quartz valley, Oro Fino, Mugginsville, Pinery, Patterson creek and other districts on west side of Scott valley. The ditches and pipes of the several hydraulic claims are undergoing repairs.

Trinity.

(Special Correspondence).—G. L. Carr of Carrville and A. Miller, a Cuban war correspondent of Washington, D. C., have organized a Chicago company to operate the Boulders mines, fifteen miles from Castella. They are erecting hoisting works and placing pumps preparatory to further sinking. The ore body, so far as known, is said to be 20 feet wide and of high grade.

Carrville, Oct. 10th, '99.

Redding *Free Press*: A. Hill's half interest in the Yellow Rose of Texas mine has been bought by G. L. Carr of Carrville and A. Miller of Washington, D. C. The deal was for cash. The owners have put a cannon-ball mill on the mine for sampling. The ore carries rich sulphurets and tellurium.——It is reported that the Trinity River Gravel Bars is to be sold. The property includes twenty-six mineral claims and 360 acres of timber and other land. The claims lie along the river from Comstock to Crooked Bend.——Captain Roberts has spent several days inspecting a mine located one and a half miles east of Doeblin's ranch, near Bragdon. It is owned by Mr. Van Ness, though under bond to other parties. The name of the claim is the Five Pines. The gold is found in black manganese which is very rich.——The Maple Creek M. Co. of San Francisco, some months ago bought hydraulic property of J. Birgen and his partners on Maple creek, eight miles south of Junction City, for $40,000. The entire holding includes 1600 acres. A pipe line 3580 feet in length is to be constructed. No. 8 steel will be used at the bottom of the syphon.

Yolo.

The bank of the Sacramento river, beginning at the railroad bridge at Woodland and running south 60,000 feet, covering an area of 400 acres, is to be mined. The directors of the Tolman mining district, consisting of W. H. Wickham, G. B. Tolman, C. H. Jackson, A. M. Brunkhorst, A. D. Jackson, C. M. Tolman, A. W. Dunlap. M. L. Jackson, E. Dunlap and E. Wenk, have filed notice of location and declare their intention of holding and working the same as placer claims. The area is divided into two claims, to be known as the Golden Sand and Golden Hunter.

COLORADO.

The Salt Lake copper smelter, which was built at Denver four years ago, at a cost of $250,000, was bought Oct. 2nd at sheriff's sale by Lewisohn Bros.

BOULDER COUNTY.

Ward *Miner*: The Comstock-Sullivan mine at Quigleyville is to resume. T. Williams, who, with J. Gaynor and others, owns the Comstock-Sullivan, reports that a bond and lease have been given to an Eastern syndicate, who will work the property. The consideration is $25,000, to be paid in installments. The property consists of two patented claims and a millsite, with steam plant and a 10-stamp mill. The development is a 240-foot shaft and 500 feet of levels. Mr. Seaman is to have charge.——J. Wright has bought the Trade Dollar, owned by Barr & Orme, for $5000, one-fifth of which was paid down. The Trade Dollar is located within half a mile of Ward and adjoins the Telegraph group. It has been opened up with several shafts. At surface the vein yielded free gold, and in the deepest shaft some of the iron ran eleven ounces in gold. The paystreak in the bottom of one shaft is 18 inches in width and streaked with iron. The vein is wide and lies between porphyry and granite walls.

EL PASO COUNTY.

Woodland Park *Times*: The North Star G. M. Co. have purchased the machinery of the Southern Cross Co. and are having the plans drawn for a 50-ton cyanide plant.

GILPIN COUNTY.

(Special Correspondence).—In the Black Hawk mill there are ten Gilpin county bumping tables and three Woodburys, all in charge of W. R. Johnson, who gives the following as the result of two tests made: First, 210 loads of ore passed through the batteries over three bumping tables and 208 loads over one Woodbury table, the result being ten tons more of concentrates from the latter than from the former. In the second test two Woodburys received the material from twenty stamps and one bumping table received the material from five stamps, and at the end of fourteen days the concentrates from each were weighed, showing that four times the output of the bumping table was 12¾ tons less than the output of the Woodbury tables, the relative stamp capacity and speed being the same.

H. B. Kenyon & Co. are operating a canvas tailings plant below Black Hawk, making a saving of $6 to $12 per ton.

Owners of the Traverse Gulch mine, near Perigo, are erecting a 20-stamp mill on their property. They will put in concentrators

W. H. Simons and Nichols Bros. have a long-time lease on the Little Fortune and Mingo, which they are preparing to work through the Drake tunnel by running a crosscut from the latter to their ore body.

The Boston & Denver M. & M. Co., operating the old Gregory-Bobtail group, are pumping 300 gallons of water per minute from the crosscut at the foot of the 1700-foot incline, by means of which the Cook and Fisk on Gregory hill are drained.

The Whitney, on Gunnell hill, has a force of nineteen men and is shipping at the rate of fifty tons per day. The ores average about $39 per ton, carrying considerable copper and lead, as well as gold. F. H Clark is Supt.

The Kansas-Burroughs Con. M. Co. operates a group of ten claims on Quartz hill, shipments from which for September amounted to 4105 tons of ore.

The general tendency of Gilpin county operatives is in the direction of consolidation of smaller interests, making cost of production smaller and the tonnage larger.

At the California mine the work of unwatering is going on, with the calculation of cleaning out the 1700-foot level and beginning work through it. The Cook shaft has reached 900 feet depth and sinking will be continued 300 or 400 feet deeper, from which point a connection will be made with the Gregory-Bobtail workings. September shipments from the Cook were 3350 tons, all but seventy-five tons of which went to the mill.

W. H. Coffin, Supt. of the New York mill, to illustrate the benefits of double concentration, recently ran eight cords of ore, first over Gilpin county bumpers, then through Soper sizers, and afterwards over a second set of bumping tables. The result was 35,000 pounds of concentrates from the first set of tables and 6000 pounds from the second set.

Central City, Oct. 4th, '99. WASCOTT.

GUNNISON COUNTY.

The Hoffman smelter at Marble is making a successful run.

LAKE COUNTY.

A discovery of rich gold ore is reported made in Echo canyon, eight miles from Twin Lakes. The new find is a vein 2 feet wide and the assays of ores go 9.18 and 52 ounces gold per ton. The vein was discovered two weeks ago and four tons of ore have been sacked. The Last Dollar lies above the New Discovery, in which a strike was made a month ago, and below the Grand Prize, which has been a shipper of $75 lead ore. Case Bros. & Knapp have twelve men opening up these mines. Three mills—two of ten stamps and one of five stamps—are now running in the Twin Lakes-Red Mountains country.

Leadville *Miner*: The Yak tunnel is getting close to the west end line and steadily approaching the Golden Eagle claim. On the Florence claim a shaft sunk in '79 is to be retimbered and sunk farther. Recent new data from Breece hill discoveries give encouragement for this contemplated development. The large shoot of copper-iron sulphides followed in from the No. 3 workings of the Ibex mines shows great strength. The ore nets $15 per ton, smelter returns. The Legal Tender or Vinnie shaft will be sunk to develop the large ore bodies worked at the 700-foot level of the Ibex. The Golden Eagle Co. owns thirty-two acres of land.——W. S. Copeland and associates of Aspen have bought from G. Englebach the lease of the Big Six M. Co., twenty-one acres, inclusive of the Nettie Morgan mine. Mr. Copeland developed the Fanny Rawlings. The Big Six has produced a large quantity of medium grade ore with comparatively small development. It is proposed to open both the oxide and sulphide ore bodies.

OURAY COUNTY.

Ouray *Herald*: A strike of high-grade silver ore has been made in the tunnel of the South Dakota, above Ironton. The ore is encountered in kidneys. It is of the same character as that found in the Yankee Girl and Guston mines. An assay of the ore returned 400 ounces in silver and $3 in gold. The property is owned by Snarr, Smith & Wheeler of Ouray.

PARK COUNTY.

J. Parriott and miners are working at the Brownlow. The machinery is to be overhauled and men put to work in the main workings. Mr. Van Baalen will direct affairs in Denver.

The London mill has pulverized 3000 tons of ore this summer, and is still pounding away.

The Gold Ore M. Co. has been running the Black Flag mill steadily this summer, and a good product is being saved. A new mill is talked of.

SAN MIGUEL COUNTY.

The Rare Metals Mining & Manufacturing Co., a French concern, has bought forty-four uranium claims in the west end of the county. A portion of the purchase money has been paid.

The sale of the Carribeau mine at Ophir is being negotiated and is reported about to pass into the hands of a new eastern company, which will inaugurate a larger plan of operation. The Carribeau is shipping an average of five cars per week, the Silver Bell two, and the Butterfly two, with six or eight cars from smaller propositions every week.

SAN JUAN COUNTY.

In Arrastra basin the Iowa mine employs 110 men, the Tiger 40, and the Silver Lake 220.

TELLER COUNTY.

Cripple Creek *Times*: On the No. 4 shaft of the Nickel Plate on Copper mountain, at 175 feet from the surface, there is a 7-foot vein, 18 inches of which will run from $20 to $30. The remainder of the vein is good for $10.——The Woods people are putting in a hoist on the Queen Bess on Carbonate hill. The shaft is down 125 feet, with a body of pay mineral in sight.——Down the hill from the Queen Bess the Woods people on the Mollie Kathleen ground have a 500-foot hole. Stations in this shaft have been cut at each 100 feet. They have abundance of low-grade ore, but they want the El Paso chute as it drives north and expect to get it.

Victor *Record*: The first ore hoisted from the Gold Coin since the fire was brought to the surface Sept. 29th. The company will ship thirty tons of ore daily. The smelters and mills are unable to contract for a greater output at the present time, so that the production of the mine will be curtailed until the Economic mill is in active operation.

NEVADA.

ELKO COUNTY.

Silver State: The mill at the Dexter mine at Tuscarora has been running steadily for forty-five days, and during that time has not been shut down fifteen minutes, except for a short period caused by the breaking of a water pipe. It is treating on an average 120 tons daily. The gross production for the month of September was over $1000 a day. The mine has produced in the last three months $75,000. The extraction is high, the value of the tailings seldom exceeding 60 cents to the ton.

ELY COUNTY.

John Nichols of Salt Lake, Utah, is successfully treating tailings in Cherry Creek canyon by the cyanide process.

LINCOLN COUNTY.

Owners of the Horseshoe mine at Deerlodge expect to employ 150 men next winter.

STOREY COUNTY.

At the C. & C. shaft the water has been lowered to within a few feet of the 2050-foot station. The latest official telegram is as follows:

VIRGINIA, Nev., Oct. 12th, '99.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco: At 6:30 this morning the water was 85 feet 8 inches below the 1950-foot level station. No. 2 elevator has been running continuously. JOS. R. RYAN.

The Zadig drift on the Occidental lode is being driven at the rate of 2 feet daily.

The Hale & Norcross M. Co. having signed the contract between the Comstock mining companies and the Truckee River General Electric Co., that document is now complete, and the first payment of the $100,000 has been made.

NEW MEXICO.

Governor Otero has appointed the following delegates to the California Miners' Association, which will meet at San Francisco on the 23rd inst.: J. E. Sheridan, Grant county; A. B. Fitch, Socorro county; J. T. McLaughlin, Santa Fe county; W. H. H. Llewellyn, Dona Ana county; W. S. Hopewell, Sierra county; H. S. Church, Otero county; T. A. Schomberg, Colfax county; G. W. Prichard, Lincoln county; A. W. Tennant, Taos county; T. J. Curran, Albuquerque county.

OREGON.

BAKER COUNTY.

A ledge of gold quartz has been located one mile east of Baker City which continues for five miles. The surface ore runs $5 per ton in gold. The locators have purchased 1100 acres of land on which the ledge is located and have commenced development.

A. Geiser, president of the Citizens' Bank, has purchased 160 acres of land west of the city, on which a large ledge of gold quartz has been located and men will be put at work to drive a 200-foot tunnel.

The Copper Queen mine has been sold to Spokane parties for $30,000, first payment of $5000 made on October 3rd. The property is located twenty miles northeast of Baker City, and has been worked for twenty years. Several tons of ore shipped to smelters in July of this year run $40 per ton.

The Carpenter Hill mine, located ten miles west of Baker City, has been sold. It is a free gold mine and averages $10 per ton.

M. C. Tobin of Chicago who recently bought a mine on Olive creek, near the Bonanza, has gone to the property. His intention is to erect a 10-stamp mill.

The Thornburg brothers have sold their thirty acres of placer ground on the north fork of the John Day, eight miles from Granite, for $23,500. E. E. Thornburg, in charge of the property, has taken out $50,000 in gold during the past few years.

The new machinery put in by the various mines in the Baker City gold field, during the past five months, will crush 600 tons of ore per day.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Since quartzite was struck in the Dacy shaft on the limestone plateau, between Squaw creek and Spearfish canyon, the American M. Co. are reported bonding claims about their property, and it is stated the ground will be developed by a tunnel run in from Spearfish canyon.

Pioneer-Times: Fifteen hundred feet south of where Otto Grantz is sacking ore, on the Poorman divide, and but a short distance from the Highland hoist, the Homestake Co. have men engaged sacking ore, on the Big Missouri. The company are taking out phenominally rich ore, practically on the surface, and there is a guard on the ground constantly, to keep specimen hunters from carrying it away. The Big Missouri was originally owned by a company of engineers and conductors of the Chicago, Milwaukee & St. Paul Railroad. The Homestake Co. at one time offered a large price for it which was refused. Several years later they bought it for a nominal sum.

UTAH.

The Utah Exchange has been bought out by the Salt Lake Exchange.

BEAVER COUNTY.

P. A. H. Franklin, who is at the head of the Franklin syndicate, by which veins of Copper gulch, near Frisco, are being opened, has verified the report that a strike had been made in the crosscut at 175 feet, and says that the presence of sulphides at water-level having been demonstrated, the sinking of the shaft to 550 feet is to be resumed. The sampling of the ore body gave 5% copper, ten ounces silver and $2 in gold, and if at 500 feet the proposition is still favorable, a concentrator of 1000 tons capacity will be built.

JUAB COUNTY.

E. L. Giraeux has an option on the property of the Watts M. Co., near the Keystone group, in Tintic, and has decided to take up the proposition on a basis of $55,000 for the entire property. In the articles of agreement he has secured the entire capital stock of the corporation. The mine is developed by tunnels to the extent of 300 feet.

W. F. Smith says that at the Midnight, near Diamond, he has cut the vein off the 260-foot level and is now following up a mineralized stratum of talc with which the ores of that part of Tintic are usually associated.

At the West Morning Glory the shaft has reached a depth of 100 feet and crosscutting to the vein will begin.

SALT LAKE COUNTY.

Bingham *Bulletin*: The Fortune group consists of twenty-one claims containing five mineral veins. Nearly all the developments to date are on one of the smallest veins, it having been easy to open. It has enough milling ore in sight to run the mill a year. The dumps would pay for building a mill, as much of their contents is said to be good enough for shipment. The mill site will be graded, and Mgr. Hill hopes the mill will start in December. It will have 100 tons capacity, the machinery to include a rock breaker, two sets Cornish rolls, two double or four single Wilfley tables, jigs and devices for saving float copper and lead.——The air compressor at the United States mines has worked perfectly since machinery was adjusted, operating seven drills at Old Jordan and Niagara and several at Old Telegraph. Its capacity is taxed to the limit and will soon be reinforced. There are 150 men working at the Old Jordan, 12 at Niagara and 42 at Old Telegraph. Last Tuesday in No. 2 west drift from Delia tunnel of Old Jordan, at 300 feet from surface, a flow of water of fifty gallons per minute was tapped. The drift is running into a body of ore in virgin ground. Since the United States Co. began developments in Old Jordan five important ore bodies have been passed through in No. 2 level. The most important one is 40 feet wide, and a shaft has been sunk 50 feet in ore of shipping quality. One of the ore bodies shows a streak 12 inches wide carrying 20% copper. The drain tunnel of the Old Jordan is to be straightened and will be used as the main outlet of the mine.

WASHINGTON.

FERRY COUNTY.

E. M. Kelly is reported to have found a new copper zone fifteen miles north of Republic. The only exploration work done consists of a crosscut on the Kelly group of claims, four in number, known as the Cache. The crosscut, through an iron capping from 6 to 10 feet thick, strikes a copper ledge 35 feet wide, between granite and limestone walls. Six feet of ore shoot sampled $38 in copper, gold and silver; copper percentage 7.8. Throughout the crosscut chalcopyrite prevails. Its smallest return was $28. Peacock ore is found throughout the loose materials.

STEVENS COUNTY.

Bossburg *Journal*: The Pomeroy, owned by the Sulphide Mountain M. Co., has struck its ore shoot in the 200-foot level after drifting for several feet from the bottom of the shaft. D. Harrington is Supt. The ore is white quartz impregnated with copper sulphide, galena and gray copper. The Pomeroy has considerable stoping ground and the mine can commence shipping as soon as the wagon road, now being built, is completed.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence.)—The Miners' Contract & Investigation Co. of Toronto, Ltd., have been granted a sixty days' extension on their bond on the Chieftan group.

Boillet Bros. of Paris, France, have purchased the Wheel Tamer at Jacko lake and the Hill Top on the west side of the Thompson river, and have a number of men at work on each property.

The ledge on the Evening Star group has been traced over the length of three claims. It is over 50 feet in width. J. H. Morrison is the owner.

It is reported that the Kimberley mine has been bonded to the Minneapolis S. M. Co.

The tunnel on the Copper King is now in about 300 feet, and the face of it is in solid high-grade ore. A concentrator will be erected at this mine during the coming winter.

The cinnabar claims on Hardie mountain have been surveyed and the owners have applied for a Crown grant. Mr. Broomhead, of London, England, is here looking over this property with a view to purchasing.

The citizens of Kamloops have sent a fine exhibit of ores to the Spokane fair. J. Donaldson, of the Pothook, is in charge of this exhibit.

Kamloops, B. C., Oct. 2, '99.

The lowest grade of ore shipped by the Le Roi M. Co. in August was $13.55 per ton, and on this it is asserted a profit of $4 75 per ton was made. The total cost of mining and treatment, it is said, is about $8 per ton.

NORTHWEST TERRITORY.

Another gold and silver strike is reported at Great Slave lake. W. Clark made the discovery, and two parties headed by McLean and Dr. Hallwright, Englishmen, traveling

from Edmonton toward Dawson, headed to the lake and made many locations. Assays put the value of the ore at from $800 to $2300 a ton.

The gold locations are at Pont du Las, northeast of Great Slave, and the silver leads are on the south side of the lake. These leads are traceable for miles. When the news reached Dawson a stampede was started. Inspector Rutledge of the mounted police and the Hudson Bay Co. at Great Slave lake are among the owners of the new fields.

Atlin *Globe*: A. Moorehouse, owner of No. 6 below, on Wright creek, Atlin district, last week found the biggest nugget yet discovered in the district. It weighed three pounds two ounces, is flat in form, and the value is over $600.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 3, 1899.

634,128.—SWIMMING APPARATUS—F. H. B. Babbe, Sanger, Cal.
634 162.—WEIGHING SCALE—W. S. Bracktle, Oakland, Cal.
634,392.—BOLT HOLDER—E. T. Clowe, Woodland, Cal.
634,230.—CONDUIT PIPE—A. S. Dixon, Escondido, Cal.
634,056.—BUTTON — A. Ducommun, Bakersfield, Cal.
634,134.—CIGAR—B. Fanta, Los Angeles, Cal.
634.333.—WRAPPING MACHINE—G. L. Gay, Spokane, Wash.
634,334.—SACK HOLDER—F. H. Gilbert, Ridgefield, Wash.
634,132.—LUNCH BUCKET—Minnie Gilmore, Garden Valley, Cal.
634,339.—BOILER FEEDER—Hanthorn & Welch, Astoria, Or.
634,113.—WATER FILTER—A. Kenney, S. F.
634,414.—STOVE GRATE—J. E. Keyt, S. F.
634,358.—PLOW—J. T. Lucas, Wasco, Or.
634,119.—ELEVATOR—R. S. Moore, Oakland, Cal.
634,270 —BOILER TUBE CLEANER—A. A. Patton, S. F.
634,182.—BRAKE SHOE—A. H. Peterson, San Simeon, Cal.
634,185.—CONFECTIONERY MACHINE — H. B. Pinney, Oakland, Cal.
634,417.—STAMP MILL—Pratt & La Grave, Carson, Nev.
634,123.—BURIAL VAULT—H. Root, S. F.
634,247.—ROASTING FURNACE — A. Ropp, Selby, Cal.
634,124.—FINGERING DEVICE—Scott & Brown, S. F.
634,373.—STORE STOOL—J. W. Smith, Portland, Or.
634,249.—EGG TESTER—A. Thomass, Los Angeles, Cal.
634,192.—TRICYCLE—S. Vaughn, Bakersfield, Cal.
634,194.—GEAR—W. C. Woodward, Los Angeles, Cal.
31,618.—DESIGN, PUZZLE BOARD — G. Schultze, Berkeley, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SWIMMING APPARATUS.—F. H. B. Babbe, Sanger, Cal. No. 634,128. Dated Oct. 3, 1899. This invention relates to an improved apparatus to aid in swimming. It consists of a palm piece having an essentially straight inner edge and a semi-circular outer periphery. A channel is formed in the outer periphery and radial bars are pivoted in said channel. A flexible covering is fixed to the bars, leaving a space between it and the palm piece for the insertion of the fingers. The device is pulled through the water by the hands, a flat surface of the flexible covering serving as a paddle. As soon as the hands are returned for a new stroke, the projection of the angular side of the paddle, being greater than the inner or straight side, tends to turn or feather the paddle so that it returns easily through the water to the starting point. It can be easily closed and dropped from the hand if it is required to use the hand for any other purpose, the device being connected by a strap with a wrist band which prevents its being lost.

AUTOMATIC FINGERING DEVICE FOR STRINGED INSTRUMENTS.—J. H. Scott and S. H. Brown, San Francisco, Cal. No. 634,124. Dated Oct. 3, 1899. The object of this invention is to provide a mechanical device by which all the chords in major or minor keys can be produced and all the strings can be held down at once instead of only a few, as in the case of the ordinary fingering of the guitar. It consists of a base or support and a means for attaching it to the finger bar of the instrument. Sets of arms are arranged—one set substantially at right angles with the other and adapted to turn about an axis common to both. Each arm of one set is connected with the corresponding arm of the other set and one set of arms lying substantially parallel with the finger board. In connection with this is a mechanism by which one set of arms is actuated to cause the other set to hold down the strings of the instrument. Spiral spring connections with the keys serve to return them to their normal position after they have been depressed, and by the use of the levers upon one side or the other of the device any set of keys can be operated to produce the chords which may be desired.

BURIAL VAULT.—Henry Root, San Francisco, Cal. No. 634,123. Dated Oct. 3, 1899. The object of this invention is to furnish a means for the disposition of the bodies of the dead without danger of annoyance to the living and without shock to the feelings of friends, caused by the usual method of enclosing the body in a close box or casket and burying it in the ground. The vault consists of a chamber with masonry walls, double doors with a space intermediate and a means for filling this space after the doors have been closed. The interior chamber has a horizontal diaphragm or partition terminating short of one end of the chamber and leaving a passage through which the gases and vapors from the decomposing body can pass. Through the passage and the return thus created, and through a vertically disposed flue filled with deodorizing material, these vapors pass, and are eventually allowed to escape into the open air in a harmless condition.

VENTILATED LUNCH BUCKET.—Minnie Gilmore, Garden Valley, Cal. No. 634,132. Dated Oct. 3, 1899. The object of this invention is to provide a means for ventilating a bucket containing different kinds of food so as to prevent the disagreeable mixing of the odors which would render the food unpalatable. The bucket consists of superposed compartments with substantially uniform diameter and provided at points above their bottoms with flanges or fillets so that the compartments may be supported one above the other to prevent continuous and substantially unbroken sides throughout the height of the bucket. These compartments have perforations above the flanges or fillets, the portions below being imperforate and fitting within the open end of the next lower compartment. A cover is provided with lugs and a bail secured to the lower compartment extends upupwardly along the sides of the bucket so as to spring into notches formed in the lugs of the cover and thus retain the bucket in an upright position.

CONFECTIONERY MACHINE.—H. B. Pinney, Oakland, Cal. No. 634,185. Dated Oct. 3, 1899. This machine is designed to press substances of various kinds into compact from or shape, and it is especially designed for use in making confectionery such as popcorn, nuts or other substances which are mixed with the boiled sugar, syrup and afterward made into disks or other forms. The apparatus consists of a base having guide posts and plate vertically movable and guided by said posts, plungers projecting from the lower face of the plate and molds coincident with the plungers having an enclosing frame with outwardly projecting flanges while other frames guided by the posts have inwardly turned flanges which engage those of the molds from below. A lever has the inner end fulcrumed and connections are made between it and the plunger plate so as to raise or depress the latter. An arrangement is fulcrumed to and movable with the frames or carriers and has a hook adapted to engage the plunger-moving lever at a greater distance from its fulcrum than that of the plunger plate, so that the frames or carriers and the mold are first raised above the material which has been molded, while the plungers act to force the material within the molds and clear therefrom.

BOILER TUBE CLEANER AND DRIVER.—A. A. Patton, San Francisco, Cal., assignor of one-half to G. H. Larkin, of same place. No. 634,270. Dated Oct. 3, 1899. This invention relates to a device for cleaning the interior of steam boiler tubes. These tubes become coated in a short time with deposits which it is necessary to clean off in order to make them effective. The apparatus consists of a head having teeth or cutters formed thereon, the head being made smaller than the tube which it is to clean and so connected with the driver that it is given a wobbling gyratory motion within the tube, so that the cutting edges are caused to constantly strike against the coating and break it away from the tube, the gyratory motion being particularly effective for this purpose. The head is preferably formed with independent removable disks of successively small diameter from one end toward the other and having the teeth made upon the peripheries of the disks so as to break joints when they are fixed together. The driver consists of a head having a flat disk forming its front end with perforations for the discharge of water and a pipe through which water is supplied under pressure. The wall has diagonally disposed holes made through it on the line of the supply passages of the head and a spindle by which the wheel is connected with the head. Ball bearings are interposed between the face of the wheel and the contiguous face of the head, and a disk or collar exterior to the wheel with corresponding ball bearings and lock nuts fitting the spindle serves to hold and adjust the wheel with relation to the head. The cleaner has a stem which forms one member of a universal coupling and a yoke extension from the face of the wheel forms the other member of this coupling through which the peculiar motion previously described is given to the cleaning head.

WATER FILTER.—A. Kenney, San Francisco, Cal., assignor to H. Zadig, R. C. Reed and Wm. Brady, of same place. No. 634,113. Dated Oct. 3, 1899. This invention relates to an improved automatically cleaning filter for water and the like. It consists of a filtering chamber, an exterior chamber within which it is contained and into which the water is admitted so as to pass through the sides of the filter to the interior, with means for discharging the water from the interior of the filter. In connection with this is a revoluble jet mechanism by which the exterior of the filter may be cleansed at will. The filter portion is fitted around a vertical central discharge pipe which has perforations interior to the filter so that water passing from the outer casing to the interior through the sides of the filter will be admitted into the central pipe and discharged through a hole at the bottom. Vertical pipes are carried in a step surrounding the lower discharge portion of the apparatus and these pipes are revoluble around the filter by means of diagonally disposed jets which revolve the tubes by reactionary force, and at the same time discharge against the exterior of the filter so as to clean off any accumulations which may be thereon.

Personal.

C. D. LANE has returned from Cape Nome, Alaska.

PROF. ARTHUR LAKES of Denver, Colo., is at Rossland, B. C.

J. H. TIBBITS is returning from Nova Scotia to Redding, Cal.

GEO. C. MUNSON of Denver now spends part of his time in Omaha.

CHAS. JACOBS is now Supt. Rawhide mine, Tuolumne county, Cal.

OSCAR SZONTAGH has returned to Salt Lake City, Utah, from Arizona.

GILBERT MCM. ROSS is about to resume operations at Copperopolis, Cal.

J. H. SNEDAKER of Denver, Colo., has gone to Mexico on mining business.

J. L. PARKER is now Supt. North Star mine, Ft. Steele district, B. C.

O. O. HOWARD JR. has returned to San Francisco from Inyo county, Cal.

H. L. WOODBURN is now Gen. Mgr. Twin Springs and Boise, Idaho, placers.

ALEX. FAIR is the new Gen. Mgr. Braidwood Gold Dredging Co., N. S. W.

MR. JUDSON of the Trenton Iron Co., Trenton, N. J., is visiting the Pacific coast.

NIKOLA TESLA is still experimenting with wireless telegraphy at Colorado City, Colo.

S. O. GRAHAM has withdrawn from the firm of Graham, Garrett & Co., Spokane, Wash.

WALLACE MACGREGOR will remove from Johnsville, Cal., to San Francisco, Nov. 1st.

SAMUEL NEWHOUSE of Utah has returned from Europe and is at present in New York City.

W. A. FARISH of Denver, Colo., is in Calaveras county, Cal., and goes thence to Arizona.

P. ELY, Mgr. Esperanza mine, Calaveras county, Cal., is visiting Salt Lake City, Utah.

E. L. GIROUX of Denver, Colo., is now associated with Byron E. Shear in the mining business.

ROB'T. CANNING succeeds C. G. W. Lock as Gen. Mgr. Proprietary Gold Mines, Lucknow, N. S. W.

C. H. TAYLOR has been promoted to the position of Gen. Mgr. New Zealand & Talisman G. M. Co.

MR. PITKEN of Webster, Camp & Lane, Akron, Ohio, recently spent some time in Colorado.

D. H. JACKSON, largely interested in El Dorado, Cal., mining properties, is visiting San Francisco.

W. PELLEW HARVEY has returned to Vancouver, B. C., from an itinerary through northeast Kootenay.

S. S. TAYLOR is collecting mineral specimens for a display at Paris in Plumas and Sierra counties, Cal.

CHAS. S. BUSH, assistant Western Mgr. Canton Steel Co., is out on a business trip over the Northwest.

FRANK E. WILSON is now managing the Lion Consolidated at Stockton, Utah, vice J. J. Trenham, resigned.

J. F. COLEMAN has gone to New York City with a $100,000 bond on the Mammoth, Shasta county, Cal., copper property.

R. H. POSTLETHWAITE has returned to San Francisco and reports the Risdon dredgers a success at Breckenridge, Colo.

J. A. YERRINGTON, Nevada State Commissioner to the Paris Exposition, is touring the State, collecting mineral specimens.

J. W. DEAN, who recently went to Denver from Arizona, has gone to Boston. He is interested in the United Verde Jr. property.

D. E. HUGHES has charge of the government work at Humboldt Bay, Cal.; Fred'k Turner has similar charge at Wilmington, Cal.

WM. A. HEWITT of the Compressed Air Machinery Co., San Francisco, has returned from a business trip through Mariposa county, Cal.

THOS. EWING is now Mgr. Arizona & New England Con. M. Co. and Nevada & New England M. Co., with headquarters at Needles, Cal.

W. B. EWER of Oakland, Cal., on the 9th inst., celebrated the 50th anniversary of his arrival in California, being then in his 36th year.

SIDNEY SPROUT, who for several months past has been superintending operations at the Rawhide mine, near Jamestown, Cal., has resigned.

WM. MAGENAU, for the past year Supt. Geyser-Marion cyanide mill at Mercur, Utah, accepts a position with Arizona & New England Con. M. Co. of Kingman, Ariz.

GOV. BRADY of Alaska reports "large chunks of float platinum," found near Enchantment bay. The recent earthquake is credited with having made further work thereon difficult.

F. L. BROWN of the American Steel & Wire Co. has returned to San Francisco from the Northwest, where, with others, he induced co-operation in organizing the Pacific Coast Jobbers' and Manufacturers' Association.

G. FITZGERALD, of El Paso, Texas, says he has received an offer from representatives of British interests in British Guiana of £150,000 for 15,000,000 acres of mineral lands in the Essequibo concession and also a part of the delta of the Orinoco, in Venezula.

OSCAR G. ROGERS, hitherto Supt. Mt. Shasta, Cal., Gold Mines, has been appointed Asst. Supt. Ratcliff Con. G. M., Ltd., Ballarat, Inyo county, Cal. A. P. Rogers, formerly Asst. Supt. Mt. Shasta mine, has been appointed Asst. Supt. of that property.

DR. FRANKLIN R. CARPENTER, who originated the idea and built the pyritic smelter at Deadwood, South Dakota, has terminated his connection with that enterprise, which was recently purchased by the Golden Reward M. Co. of Deadwood. Dr. Carpenter has built the smelters from a small experimental plant up to one of the most important metallurgical plants in the West.

WALDEMAR LINDGREN is at present investigating a 120-acre tract in the city of Spokane, Wash., which has been located as mineral land. A recent ruling of the Department is that fireclay is "mineral" and ordinary clay is not. Upon the determination of whether the deposit in this case is fireclay or not depend considerable values. Mr. Lindgren has had charge of a party this summer making extensive Government reconnoissance in the Bitter Root mountains, between Montana and Idaho, and an almost wholly unexplored region between the Clearwater and Salmon rivers.

Industrial Notes.

—Utah's first State Fair is in progress.

—There is a general advance in price) ! coal—bituminous and anthracite.

—Colorado and California report a continued scarcity of all kinds of required labor.

—Raw rubber is now worth $1 per lb. at Para, and the demand exceeds the supply.

—Everything that enters into construction work of any kind has advanced from 25% to 80% in the past year.

—In the nine months ending Sept. 30th a total of 2700 miles of new railroad were laid in the United States.

—The Canadian Government has granted a bounty of $2 per ton on iron smelted in Canada and $5 per ton on steel.

—The California State Association for the storage of flood waters will have a convention in San Francisco on Nov. 14th.

—During the first six months of '99, 125 vessels, aggregating 234,877 tons, were launched on the Clyde, beating all records.

—In his December message President McKinley will urge a Government cable across the Pacific to the Phillippines via Honolulu and Guam.

—The British Columbia Electric Railway Co., Vancouver, B. C., proposes to expend half a million dollars in extending and improving its local lines.

—The U. P. R. R. has increased its preferred capital stock by $25 000,000. The company now has control of the Oregon Short Line and the O. R. &. N. Co.

—Nevada proposes to ship gypsum to San Francisco from Mound House, Lyon county, 50 cents per ton cheaper than it can be imported from Mexico.

—Rebuilding Victor, Colo., has been checked by a hod carriers' strike; they demand an advance of 50 cents per day of eight hours over the present $3.50 rate.

—The Gonzales, Cal., Water Co. will dam the Salinas river and run the water ten miles in a ditch 20 feet wide at the bottom and 40 feet at the top, for irrigation.

—California miners who went to Pleasant Valley, Utah, coal mines, rejected the proffered contract, which would average, per month, $2.65 per day of ten hours.

—The Japanese Government will introduce at the next meeting of the Diet a law freeing foreigners from all restrictions in locating mining claims. The existing law prohibits them from becoming shareholders or partners in any mining company.

—A European syndicate has been organized, capital $50,000,000, to raise hogs in Siberia and transport them to English and German markets in competition with American pork. The report does not frighten Chicago packers. "They never can raise good hogs in that country," says John Cudahy.

—Robertson, builder of the log raft floated from the Sound to San Francisco with such menace to coast shipping, says hereafter he will follow such log raft with a tug carrying rear lights and that he proposes floating such rafts to Hawaii and Japan. He sailed for Tokio on the 9th in reference to the latter scheme.

—Consul McCook of Dawson City reports to the State Department that the mining outlook for the Yukon country is improving, and that it would be a paying venture for machinists to go there with material to make machinery, which is in great demand. Consul McCook appears to have a chronic tendency to exaggerate.

—In New South Wales there are 7300 more men employed in the mining industry than in 1894: Gold mining, 2700 men; silver, 2000; copper, 1300; coal, 1100; the production of gold in New South Wales has quadrupled since 1888, and has doubled since 1898; in the latter year the production of gold was valued at £1,250,000; the value of the copper product increased from $315,000 in 1894 to $1,405,000 in 1898. In 1898 the coal production was 4,275,000 tons.

—The annual report of the Northern Pacific Railroad Co. shows increase in the gross earnings over the preceding year, and decrease in the net earnings. The report covers the fiscal year ending June 30, '99, showing gross earnings, freight, $19,485,960; against $17,432,755 last year; passengers, $5,050,365, against $4,853,799 last year; mail, express and miscellaneous, $1,512,358, against $1,393,165 last year; operating expenses comprise $3,584,793 for maintenance of way and structures, against $3,137,505 last year; $1,914,597 for maintenance of equipment, against $1,721,765 last year; $8,060,033 for conducting transportation, against $5,573,635 last year, and $826,028 general expenses, against $663,457 last year.

Dividends From the Transvaal.

When one realizes fully the dividends which are received by the shareholders of stock in the mines of the Whitwatersrand, it is easier to appreciate the value placed upon these mines by the owners, and explains why the political situation is disturbed in the Transvaal. Following is a list of some of the leading companies and the percentage of their earnings on the capital stock:

Mines.	Per Cent.
City & Suburban	15
May Consolidated	15
Windsor	20
Rietfontein	22½
Driefontein	25
Glencairn	25
Knights	30
Rose Deep	40
Griesberg	40
Roodeport United	40
Langlaagte Estate	45
Angelo	50
Crown Deep	50
Primrose	55
Village Main Reef	60
Meyer & Carlton	60
Worcester	60
Glendennuis Deep	75
Durban Roodeport	80
Jumpers	80
Bonanza	100
Jubilee	100
Heriot	100
Henry Nourse	125
Geldenhuis Estate	147½
Wemmer	150
Crown Reef	240
Ferreira	300
Johannesburg Pioneer	675

The total amount paid in dividends by the gold-producing mines was in 1896, $7,450,000; in 1897, $13,500,000, and in 1898, $24,450,000.

After reading these figures, it becomes easy to understand the remark attributed to Sir Alfred Millner the day he left England to return to South Africa, when asked by a reporter what would be his policy with regard to the Transvaal. "If," he said, "you saw a solid pile of gold worth £500,000,000 over there, with 20,000 Boers armed to the teeth sitting upon it, what would you do?" Less enigmatic was a statement made by Lionel Phillips, one of the Rand millionaires: "We don't care about the franchise; we want the mines."

POLARIS, the north star, and its unseen companion make a complete revolution in three days. Both together are moving toward the earth with a velocity of nine miles per second. Though coming at such speed, there is no danger that in the immediate future Polaris will collide with the earth. There has been no appreciable difference in the appearance of the star, in spite of its rapid approach, during the past thousand years. The star is 300,000,000 times as far away as the sun.

Kaolin in San Diego, Cal.

The recent sale of the kaolin deposits on El Cajon mountain, twenty miles east of San Diego, Cal., has attracted attention to the commercial value and uses of this article. The San Diego deposit is said to be inexhaustible: in one place a shaft was sunk 80 feet through the clay, which in quality is said to be superior to that imported from China.

Kaolin is of value in domestic industries, the white clay being used in the manufacture of china, earthenware, pottery, wall paper, ornamental brick, cloth, etc. Kaolin deposits are extensive throughout the United States, more especially in the South, in nearly every section of which are found valuable kaolin deposits. With this appears an illustration of a kaolin mine owned and worked by the Harris Clay Co., near Webster, North Carolina, reached by the Southern Railway, of which M. V. Richards of Washington, D. C., is the land and industrial agent.

KAOLIN MINE NEAR WEBSTER, NORTH CAROLINA.

New Use for Scrap Tin.

A number of Illinois gentlemen interested in the utilization of scrap tin, of which large quantities have been annually going to waste, are about to equip a refining plant, which will probably be located at Streator. The company will be known as the Vulcan Western Co. The line of work will be to purchase scrap tin, separate the tin from the sheet of steel and sell the product as raw material. Tin forms only about 2%, the steel in a sheet of tinplate forming 98%. The company has already contracted for a supply of waste tin to give employment to 140 hands, and say that the entire quantity of waste tin to be accumulated in their territory will give employment eventually to the entire capacity of the factory, namely, 175 men. The solder when separated from old tinware returns a profitable revenue. Numerous branches of the iron industry throw off enormous quantities of scrap material annually, which heretofore has been going to waste, but is now being turned to an item of profit.

A New Armor Plate.

Some experiments have been carried out at the Government School of Gunnery, Shoeburyness, England, with a new kind of armor plate, 6 inches of which is of ordinary steel and 3 inches of a special composition, the nature of which has not been made public. These plates have been fired at with 350-pound projectiles at a distance of 200 yards. When black powder was used, the plate was practically uninjured after several shots, and in some cases the projectile was reduced to dust by the force of the impact. With cordite it was found that the plate could be penetrated for about 3 inches, or even pierced; but the severest tests failed to cause the plate to crack, a circumstance that will make it useful in naval warfare, for a hole beneath the waterline can always be plugged with matting. Two shots were then fired at the plate simultaneously, hitting the plate 1 foot apart, but still the composition was not fractured. The plate was then fired at obliquely, when it was found that the special facing split from the steel backing, although the welding was previously invisible to the eye.—American Manufacturer.

AN invention for producing gold-like alloy from copper and antimony, patented in Germany, covers a metallic alloy to take the place of gold, which, even if exposed for some time to the action of ammoniacal and acid vapors, does not oxidize or lose its gold color. It can be rolled and worked like gold. The alloy consists of copper and antimony in the approximate ratio of 100 to 6, and is produced by adding to molten copper, as soon as it has reached a certain degree of heat, the said percentage of antimony. When the antimony has likewise melted and entered into intimate union with the copper, some charcoal ashes, magnesium and lime spar are added to the mass when the latter is still in the crucible.

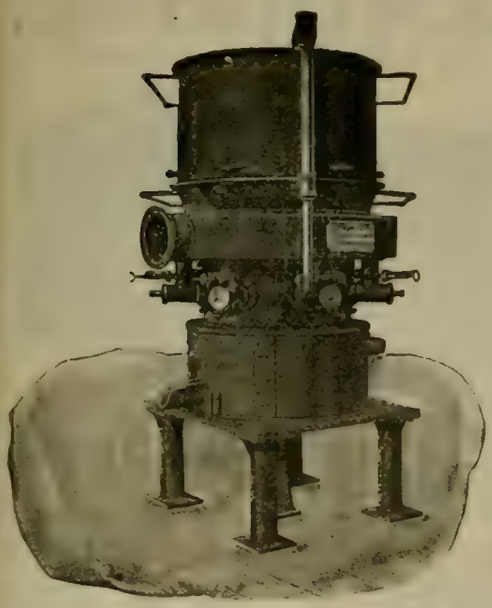
WILFLEY CONCENTRATOR.

Over 2000 in Use.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.



One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

A MODERN COPPER SMELTER (ROUND FORM).

THE COLORADO IRON WORKS CO.,

Established 1860. DENVER, COLO.

MANUFACTURERS OF

Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake.
No better device has been designed for this purpose. For prices and further information address the builders.

NO MORE PACKING DIRT TO WATER.
—THE—

PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.
Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

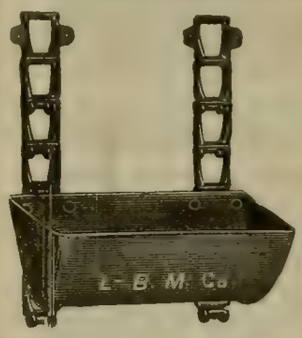
THE IDEAL CONVEYOR BELT



LEVIATHAN

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.
55-57 Market St., Chicago. 120 Pearl St., Boston.
SEND FOR PRICE LISTS AND SAMPLE.

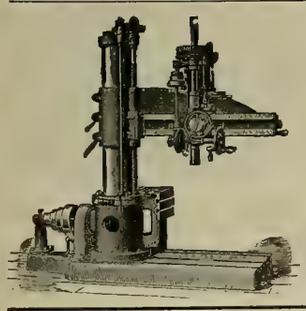
Denver, Colorado, U. S. A.



"The Proof of the Pudding is in the Eating."

Something over a year ago, two of these Richards' Patent Triple Plunger Pumps, with motors as shown, were supplied to a mine in Mexico, for the purpose of raising water to an elevation of 650 feet. The owners were so well pleased, that they ordered another of the same a few months later. These pumps were arranged with outside packed plungers, for pumping muddy water — designed for that purpose, they did it satisfactorily.

For all purposes where a uniform resistance to the driving motor is a consideration, these pumps are admirably adapted. Triple Plungers and crank shafts run in a bath of oil if desired. Made with large valve areas, and by actual test develop a very high efficiency. Furnished with or without motors, or for use with gas or steam engine.

This is only one of over fifty different kinds of pumps we make.
Our 1899 Catalogue tells all about them; sent on application.

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see this Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Commercial Paragraphs.

AT THE Golconda, Oregon, mine a Bryan roller mill and eight Johnston concentrators have been ordered.

JEAN F. WEBB, of Denver, Colo., proprietor Webb Pneumatic Cyanide Process, has sold Boulder, Colo., rights to the Manila M. Co.

THE Weigele Pipe Works, Denver, Colo., report having contracted for water power and placer pipe which requires their full capacity for two months.

THE Vulcan Iron Works Co. of Seattle, Wash., are building and installing a large tramway on the property of the Golden Tunnel M. Co. at Baring, Wash.

HENDRIE & BOLTHOFF Manufacturing & Supply Co., Denver, Colo., have the contract to erect an 80-stamp mill for the Boston & Denver M. & M. Co. at Black Hawk, which will handle all the ores from the Gregory-Bobtail mines and those of the Cook M. Co. The stamps will be 1000 pounds weight, rapid drop, and will be equipped with twenty-four Woodbury concentrators. It will be automatic throughout and will be built under the direct supervision of Mr. H. Bolthoff, one of the pioneer millwrights of the State.

THE Denver Engineering Works Co. have made a shipment of eight carloads of machinery to Atlanta, Georgia, for the construction of a Loder pyritic smelter near that place by the Southern Smelting Co. The same type of furnace has been put in at the remodeled Elgin smelter at Leadville, Colo. A plant of similar style is contemplated for British Columbia. Cammett & Shepard of the Denver Engineering Works report having received patent papers No. 632,892 on the Cammett concentrator. The Denver Engineering Works report having shipped the machinery to Breckenridge, Colo., for the Mountain Pride 75-ton concentration mill, of which H. C. Foote is Mgr. Shipment has also been made of machinery for the Excelsior mill at Frisco, Colo.

Recently Declared Mining Dividends.

Portland, Cripple Creek, Colo., $60,000; payable Oct. 15.

Gold King, Colorado, $30,000; payable Oct. 20.

Mercur Co., Utah, quarterly, $50,000; payable Oct. 20.

Bullion-Beck, Utah, $10,000; payable Oct. 15.

Catalogues Received.

CATALOGUE No. 15 of the Gates Iron Works series is devoted to the exclusive discussion of cement machinery, which this company produces. So far as known this is the first time that a manufacturing establishment has produced a catalogue relating to a complete line of modern machinery for cement making, taking in the whole process. The Gates Iron Works show in Catalogue No. 15 that they are prepared to make complete plans for cement mills, equip the entire plant with all requisite machinery and erect the buildings, and have everything ready to begin successful operation. Machinery of the latest modern type, built with special reference to requirements of commercial economy, is described, suitable for the production of Portland or hydraulic cement. Not the least interesting part of the pamphlet is the emphasis placed on the statement that all machinery is so packed and prepared that it may be safely carried and delivered foreign. The catalogue will be sent anywhere on request. Address Gates Iron Works Co., 650 Elston avenue, Chicago.

Single claims and groups. One large ledge, low grade, free milling. Undeveloped copper properties. PACIFIC MINING & DEVELOPMENT CO., Redding, Cal.

STOCKHOLDERS' MEETING.

Notice of Stockholders' Meeting of the Oneida Gold Mining & Milling Company.

In accordance with a resolution passed by the Board of Directors of the Oneida Gold Mining & Milling Company, a meeting of the Stockholders of this company will be held at 2 o'clock in the afternoon on TUESDAY, the 24th day of October, 1899, at its principal office, Room 24, No. 320 Sansome St., San Francisco, California, to consider and vote upon a proposition to increase the capital stock of this company to Two Million Dollars in Four Hundred Thousand Shares at the par value of Five Dollars each. JOSEPH H. MOOSER, Secretary.

Dated San Francisco, Cal., Sept. 8, 1899.

WANTED—For Eastern syndicate, developed and paying gold mine; no limit as to price. **FOR SALE**—Hydraulic properties and developed and undeveloped quartz mines in promising mining localities. Purchaser may deal with owner direct. W. F. ARAM, room 40, 8th floor Mills Bldg., S. F.

Electrical and Steam Engineer, with first-class experience in electrical mining machinery and haulage, wants a steady position; is industrious, strictly reliable, does all the repair work in first-class style. Good references. Address J. M. S., Mining and Scientific Press, San Francisco, Cal.

WANTED,
AMALGAMATOR AND MILLMAN WHO ALSO UNDERSTANDS ASSAYING.
Address GOLD HILL QUARTZ MINING CO., Gold Hill, Oregon.

Mining Engineer and Metallurgist Desires Position as Superintendent.
Fifteen years of practical experience in mining and milling in the United States, Canada and Mexico. Thoroughly competent in every respect. Speaks and writes Spanish fluently. Specialist in the treatment of rebellious silver and gold-bearing ores. Experienced in designing and building of mills.
Address F. VALENTINOV, Apartado Postal 814, City of Mexico.

WANTED!
2500 MINERS
To work in the Metalliferous Mines of British Columbia, at the following prices per day of eight hours:

Hand Drillers,	$3.00
Machine Men,	3.50
Miners in shafts,	3.50 to $4 00
Carmen,	2.50 to 3.00
Shovellers,	2.50
Laborers,	2.50
Blacksmiths,	3.50 to 4 00
Timbermen,	3.50 to 4.00

Apply to THE SILVER-LEAD MINES ASSOCIATION, Sandon, British Columbia.

HEALD'S
BUSINESS COLLEGE.
24 Post Street, - - - San Francisco.
MINING AND CIVIL ENGINEERING DEPARTMENT: Mathematics, Draughting, Strength of Material, Chemistry, Assaying, Blow-Pipe Analysis, Geology, Mineralogy, Surveying, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation.
ELECTRICAL DEPARTMENT: Theory and Practice; Construction.
BUSINESS: Bookkeeping, Shorthand, Typing, Modern Languages, etc.
Twenty teachers; individual instruction; can enter at any time; Catalogue and Journal free.

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of September, 1899, an assessment (No. 20) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of October, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1899, an assessment (No. 1) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of October, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of September, 1899, an assessment (No. 13) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1899, an assessment (No. 33) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 31, 10th floor Mills building, San Francisco, California.

ANDES SILVER MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of October, 1899, an assessment (No. 49) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of November, 1899, at 1 o'clock P. M., to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of October, 1899, an assessment (No. 3) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

Mine Management.

One of the most important factors in making a success in mining is the exercise of common sense. A vein or an ore body may be large, but it is not always advisable to build a mill or reduction works before the vein has been developed. It may not prove to be as extensive with development as the surface showing indicates, or even if it does hold out there are few ore bodies which will keep a large mill supplied without some preliminary work being done to render the ore cheaply and quickly accessible. An instance in point is found at the old village of Altaville in South Dakota. In 1879 two brothers located several claims, the principal one being known as the Jenny Lind. It was recognized as a good prospect and in the course of a few months the property was sold to an Eastern company. The development was superficial, but a 40-stamp mill was rushed to completion, a large force of men employed, and, as the saying is, "everything went." A gentleman of high social standing in his Eastern home was sent out to manage the enterprise. He had never seen a mine before and knew not even the rudiments of an industry which requires more than ordinary business capacity to say nothing of practical experience. The natural result—failure was the consequence. The mine was closed down and later the mill moved elsewhere. A year or two since a practical miner took the property after an investigation and commenced working it on a small scale. He discovered that not all of the vein or lode was rich, though some of it contained sufficient to constitute pay rock. By careful selection of his ore he made a success from the start and has since enlarged his plant and is making a success. This is but a single instance. Nearly every mining community has similar monuments of ill-investment and folly in management. A mine manager who is deficient in technical knowlege of his business will, if he is wise, select reliable and experienced men to take charge of the various departments of the enterprise, making them responsible for the results, and where this has been done few failures have followed. This is common sense mine management.

KNOWLEDGE comes with experience. The broader the field of observation the more extended the experience—the greater the knowledge gained. A man who has learned all he knows in one mine, or one district, or even in a single State, has not so much knowledge as one who has seen more, though he may have learned what he does know thoroughly. To say of a man, "He mined forty years in this or that mine or county," is not paying as high a tribute to his experience as at first might appear. Men who have mined for so long in any one place, or who have conducted the metallurgical operations in but one mill or reduction works for years, have much else to learn, and in some cases much which would be of advantage and value in the mines or mills in which they are employed.

THAT a stampede to Cape Nome is inevitable in the spring of 1900 seems certain. The facility with which gold has been thus far obtained on the ocean beach and in the shallow placers and the large returns for limited labor would prove a great incentive under any conditions, but being so easily accessible a "rush" which will eclipse the Klondike stampede is probable. Those who think of going to the arctic circle should remember that the thousands already there, and other thousands who will reach Nome from other sections of the North before the ships can possibly get there will have located everything within miles and the newcomer should go prepared with sufficient money to either buy property already located or to take return passage by steamer. There are miles of country farther north and all along the coast of which little is known, but the discovery of gold in those localities is a matter of good fortune and will be accompanied by all the hardships which have marked the progress of the development of the Yukon region.

EXAGGERATED statements concerning mine development, ore in sight, production and possibilities, are in these days taken with much allowance. Twenty or thirty years ago less attention was given to the facts than now. A mine with half a million in sight would readily sell then for double that amount. Now the cost of equipment and production is charged against the half million and a reasonable allowance made for ore not blocked out, for experience has proven that ore bodies are erratic; they often fail to "go down," or, going down, have been known to decrease materially in value. There are some who cannot understand why this is so. They were well known in the "good old days" when everything was taken for granted, and they can see no reason why the same conditions should not obtain now. Then all mining was looked upon as a gamble and investors had to take a gambler's chance. Now mining is a legitimate business and it is yearly growing more conservative. Capital is ready for investment, but it must see something tangible, and where this is possible it is not more timid than in ventures in other lines. Mining experts are not now solicited to give opinions as to what can not be seen, but to state the facts concerning a mining property as determined by development. They must also advise as to treatment of ores, equipment, transportation of product, etc. The palmy days of the speculative miner and investor are gone, and instead is found a demand for facts.

Charcoal in the Cyanide Process.

Several years ago charcoal was employed experimentally as a precipitant of gold from chlorine solutions, and a patent was issued for this process. It has not come into general use. At the Mount Morgan gold mine, Victoria, Australia, however, this method of precipitation of gold in the chlorination process is employed on an extensive scale. The filters are very large and are lined with cement. The process at these extensive works proves its utility and experience there has evidently determined its superiority to either the ferrous sulphate or sulphuretted hydrogen method of precipitation. In 1884 the late W. D. Johnson, of San Francisco, Cal., who at that time was chemist of the State Mining Bureau of California, made a series of experiments with cyanide as a solvent of gold and also with charcoal as a precipitant of the auro-cyanide. In order to facilitate the dissolution of the gold, Dr. Johnson added to the solution of cyanide of potassium a small quantity of peroxide of barium which, it was claimed, greatly facilitated and hastened the action of the solution, tests demonstrating that while the ordinary cyanide solution would accomplish the dissolution of a given amount of gold in from eighteen to thirty-six hours, the same quantity of gold would be dissolved with the Johnson solution in two to three hours. If worked on a commercial basis it would effect a great saving. In experimenting with charcoal as a precipitant Dr. Johnson first placed a small, solid block of charcoal in a beaker containing a solution of auro-cyanide, and it was found after a time to be coated on the under side with a thin film of gold. After numerous experiments of various kinds he devised a filter and passed the auro-cyanide solution through it. The filter was a small affair consisting of a 3-inch glass funnel, such as is commonly used in the laboratory. This was lined with filter paper of the ordinary kind and within it was placed powdered charcoal. It was found that the charcoal precipitated a notable quantity of gold but not sufficient to make it a success. The writer, who knew of these experiments, suggested that a second and third filter or even a larger number be employed in series. This was done with the result that all the gold was extracted from the solution.

In Australia, at the mills of the Brilliant Extended G. M. Co., wood ashes was used to keep the quicksilver in good condition when grinding concentrates which were being treated by amalgamation. In subsequent treatment by the cyanide process the amount of gold which could be extracted was small. An investigation discovered a considerable quantity of charcoal in the sludge which had come from the wood ashes. A quantity of this charcoal was collected and upon being incinerated and assayed was found to be rich in gold, thus proving further that charcoal is a precipitant of gold from cyanide solutions.

Notwithstanding the fact is well known that charcoal will precipitate gold from cyanide solutions, the process is very little employed. The most notable instance is at the South German Works, at Maldon, Victoria, where W. B. Gray has introduced it on a large scale, probably being influenced to give the process a thorough trial by the success of the application of charcoal in the chlorination process at Mount Morgan. The agitation process is employed at the South German Works, and the gold solution drawn off after settling, passed through a filter to arrest any slimes that may be in the solution.

In this plant forty filters are employed, set in eight series, with five filters in each row. The filters contain 560 pounds of powdered charcoal, which has been previously washed, and the plant treats 400 tons of tailings weekly. Bosqui, in "The Cyanide Process," says that the first filter precipitates 45% of the gold, the second 25%, the third 15%, the fourth 9% and the fifth 5%, thus effecting a saving of 99%. It will be noticed that each succeeding filter extracts an increasingly larger percentage of the gold remaining in solution. The filters may be employed until sufficiently rich to warrant their incineration and the recovery of the gold. Only those filters rich enough to justify it need be removed and the lower filters moved upward, new filters replacing them at the foot of the series.

The cost of charcoal at this plant is about 5 5 cents per ounce of gold saved. The gold has a higher fineness than that precipitated by zinc, and it is claimed the charcoal will throw down gold from the weakest solutions. The total cost at these works is 63 cents per ton, of which 32 cents is for cyanide.

An objection has been made to the use of charcoal filters for the reason, as it is claimed, that fine particles of the carbonaceous matter pass the filters and contaminate the solutions, unfitting them for subsequent use; but it seems that by the employment of a proper filter this might be obviated.

The incineration of the charcoal in retorts seems to offer less opportunities for loss than when accomplished in pans.

Mining in the Transvaal.

During the year 1898 the mines of the Witwatersrand produced $75,000,000, or within $6,000,000 as much as was ever produced in a single year in California, where in 1852 gold to the amount of $81,294,700 was taken from the mines.

The gold output of the Witwatersrand was from the operations of seventy-seven companies, having in the aggregate 4765 stamps. The greater number of these companies are working from the outcrop downward, or on the first row of levels, there being during the year but eleven companies operating what are termed deep levels, though there are a number of companies sinking on the second and third row of deep levels, which have not yet come into production. When this occurs the output will be largely increased. The average duty of a stamp on these mines is about four tons per day, or about 1500 tons yearly. Taking this as representing the average crushing capacity, the tonnage milled was about 7,000,000 tons. A much larger amount of ground was broken, as many of the mines sort out and reject that portion of the conglomerate too low grade to pay.

When quiet again reigns in the Transvaal its mining industry is likely to expand far beyond its present limits. The Minister of Mines has ventured the prediction that not less than 12,000 stamps will be in operation within the next five years, with a crushing capacity of 18,000,000 tons annually, which at the present value per ton will make an output of $180,000,000 annually.

These mines are of such character that they render these estimates entirely within the bounds of probability, for up to the present time they have not developed those extreme inequalities of occurrence so characteristic of mineral veins and deposits elsewhere, and the mining operators of that region figure as confidently on the future development and production of their properties as though the rock were actually in sight. In these mines it is not unlikely that deep mining will only be limited by the economic result, and that so long as the mines can be profitably worked other obstacles than heat and distance must be encountered before mining ceases. As in the past, the necessities of the case will result in ways and means now untried.

The cost of labor in these mines during the year 1897 was 32% of the total expenditure, and in 1898 was 34.5%. That of native labor was but 15%. During the present year, owing to the falling off of the supply of native labor, the white labor will no doubt show a material increase, but the extensive introduction of power drills will become a factor in keeping the cost of mining down, so that while the cost of white labor may be found to constitute a larger percentage of the total expenditure than in former years, the cost of mining may not be materially increased.

Concentrates.

MANGANESE has more affinity for carbon, sulphur and oxygen than iron has.

SULPHUR combines with iron in any proportion up to 55%, forming a sulphide.

THE royalty charged by the Russell process people is from 10 cents upward per ton.

GALVESTON, Texas, is exporting spelter ores. The September total was 1939 tons.

A COMPLETE description of the "bromine process" appeared in the issue of Feb. 19th, '98.

SAN FRANCISCO foundrymen are buying old mining machinery in Eureka, Nevada, for $8.50 per ton.

PETROLEUM, or other oil lands, may be located, held and patented under the rules governing placer locations.

IT is understood that the De Lamar, Nevada, mill has used 900 pounds of cyanide daily, about three pounds per ton.

A DYKE as an accompaniment to a vein is an indication of permanency of the fissure rather than of richness.

A COLUMN of water 1000 feet in height is equal in weight to a column of mercury of equal cross-section 73.8 feet high.

RUSSIA allows cyanide of potassium, exclusively for use in the Siberian and Ural gold mining industry, to be imported duty free.

EXCEPT some desultory operations in San Luis Obispo county, no chrome iron deposit in California is now being worked at all.

THE success attending the intelligent reopening of old mines in California is proving a strong stimulus in adding others to the increasing list.

A PURCHASER at foreclosure sale takes whatever interest the mortgagor had in the land at the time the mortgage was given, and that alone.

THE deepest mine in Colorado is the Geyser, at Silver Cliff. For nearly a year Supt. Elmendorf has been hoisting from the 2600-foot level.

THE State Tax Commissioner of Michigan says that there is over $100,000,000 worth of mining property in that State which now escapes taxation.

THE Mining Department of the Russian Government offers for sale Eastern Siberia placer mines to the highest bidder, the sale to be next February.

THE controlling interest in the Tacoma, Wash., smelter is understood to be held by D. O. Mills and other owners of the Alaska-Treadwell property.

WHILE zinc occurs as abundantly as either lead or iron in the sulphide zone of Leadville, Colo., it is almost wholly absent in the zone of oxidized ores.

THERE is no local demand for, or production of, nickel. Latest New York quotations are $1 per pound for No. 1 oxide black, or green; for No. 2, 60 cents.

WHEN it is noon in London it is 7 A. M. in Boston; when noon in San Francisco it is about a quarter past 3 the same afternoon in New York City, sidereal time.

PLATINUM is worth $15 to $18 per ounce. The reported discovery of platinum at Hot Springs, Arkansas, "going five pounds to the ton" is not likely to affect the market.

ALL government land is subject to mineral location if discovered to contain mineral deposits or veins, whether the land was previously recognized as mineral land or not.

THE law of Colorado does not give a lien on the estate of the lessor of a mine to secure a claim for wages to one who has done work in it under a contract with the lessee.

A FIRE EXTINGUISHER which may easily be made and kept stored in bottles ready for use consists of 3 pounds of salt and 1¼ pounds of sal ammoniac dissolved in a gallon of water.

THE Lake View Consols mine in Western Australia is one of the richest gold mines in the world. In July it produced 8009 tons of ore which yielded $622,500, an average of over $77 per ton.

IN the Terrible mine, in Colorado, a large quantity of carbonate of lead was found in a porphyry dyke, in which the ore occurred as a replacement of the original rock. The dyke cuts a granite formation.

WITHIN the present month a number of serious accidents, some of them fatal, have occurred in mines from the explosion of missed holes. Too great care cannot be taken when disposing of a missed hole.

A NOTE of a corporation, issued by an officer or an agent having authority to issue notes, is valid and enforceable against it, in the hands of a bona fide holder, though it was executed for an unauthorized purpose.

WHERE the business operations of a corporation have become unprofitable, its working plant, franchises and privileges may be disposed of at private sale if the terms have been agreed to by a majority of the stockholders.

THE wages of a watchman or keeper of a mining property cannot apply as assessment on an unpatented claim unless the watchman or keeper actually performs labor or improvements to the extent of the necessary assessment.

PUMICE is produced in commercial quantities in California. It is also mined at Black Rock, Utah, the finished product selling in Chicago at from $25 to $35 per ton. It is brought as ballast from Europe, which militates against domestic production.

THE term "blowing in," as applied to blast furnaces, has reference to the time when the fires are started up after having been shut down for a time. The fire is started and gradually increased for several days in order to have the brickwork thoroughly dry.

THE courts have decided that a certified check is one secured by the bank against which it is drawn—the bank holding an amount equal to the value of the check subject to the demands of the person in whose favor it is drawn until the check is presented for payment.

IN the issue of Sept. 30th a misstatement was made in regard to the limitation of time for filing location certificate with the county recorder in the Territory of Arizona. Ninety days are given by the revised code of Arizona, not sixty days as previously stated.

EASTERN "scientific" journals assert that Prof. W. C. Day of Swarthmore College, Philadelphia, Penna., has "duplicated Utah gilsonite by making asphalt out of herrings and sawdust," but it is not probable that the commercial success of the former will be seriously interfered with thereby.

THE gross ton is employed by many technical writers in their computations of quantities for the reason that it corresponds more nearly to the metric ton than the short ton of 2000 pounds. A long or gross ton (2240 pounds) equals 1.01605 metric tons. A metric ton contains 2204.62+ pounds.

ON a mining claim, patented, or whereon the necessary assessment work has been done, no one against the will or permission of the owner can work or legally attempt to work in any manner. This applies in a quartz claim to an area of 300 feet each side of the center of the vein and 1500 feet in length.

MOST of the great iron ore deposits of the United States occur in the Algonkian formation, which is intermediate between the Archæan and the Cambrian. The Algonkian includes various clastic rocks—the result of the degradation of the Archæan—and contains traces of the remains of organic life.

IN the early days of drift mining at Mokelumne Hill, Calaveras county, Cal., an amorphous silica was found associated with the volcanic tuff covering the gravel channels. Some of these segregations possessed all the properties of opal, and a very few of them exhibited a faint play of colors. One, it is said, was sold for $75.

THERE are numerous hills which are the result of uplift, and some are formed by the outpouring of lava upon the surface or the accumulation of vast heaps of cinders and fragmental volcanic detritus about craters, but for the most part the hills are carved from greater masses and are the result of erosion, being remnants of much larger bodies of rock.

"CALL LOANS" such as cited are secured at very low interest rate because the lender is amply secured by collateral that can be instantly turned into cash, different from real estate security. Then, too, in a "call loan," the lender can at once sell the collateral without delay or legal expense in the event of the borrower not meeting his obligations.

NICKEL occurs associated with chrome ores in serpentine in North Carolina, and the deposits near Riddles, Oregon, are similar. The ore occurs chiefly as silicate. The nickel ores of the noted mines of Sudbury, Canada, are sulphide — nickeliferous pyrrhotite with chalcopyrite. All pyrrhotite does not contain nickel, though it is of common occurrence.

EARTHQUAKES cannot be successfully predicted. A long period of scientific observation of seismic disturbances has failed to show that an approaching earthquake can be predicated by the weather or by the most scientific instruments. These disturbances, which are caused by movements of the earth's crust, may occur at any time in any part of the world.

LOCAL mining regulations determine the width of quartz lode locations, but in the United States they cannot exceed 300 feet on each side of the middle of the vein, nor can local law make them less than 25 feet on each side of the middle of the vein. All placer locations are twenty acres, and local law cannot make them less than that area, no matter how rich they may be.

T. D. S., GRASS VALLEY, Cal., can, by sending 50 cents to the Director of the U. S. Geological Survey, Washington, D. C., with request for Folio No. 29, enclosing the exact amount (50 cents), get a good publication that could not be issued privately for $50. Stamps or money orders are not accepted. Should the edition be exhausted, the money would be returned to the sender.

NOTHING is regarded as utterly impossible, nor is it assumed that the limit of knowledge has been reached. Some of us expect to die learning, but wave motor mechanism and flying machines do not yet seem to have reached the stage of practical development that would warrant immunity from such irreverent criticism as that so vigorously objected to by a Jerome, Arizona, correspondent.

TIN ORES occur in Bolivia in andesitic or trachytic rocks of Tertiary age. In the Black Hills the tin ores are associated with tantalite, columbite and certain lithia-bearing minerals, occurring in granitic dykes of coarse crystallization. In California the cassiterite is found in a matrix of tourmaline, consisting of a mass of fine acicular crystals, with some quartz. The veins occur in or associated with granite.

REGARDING T. A. Edison's acquiring a New Mexico tract to extract gold therefrom, Edison's agent says that "electricity is to make everything ready for another force to do the work of separation which electricity can not do, since it repels rather than attracts gold. That other force is air, propelled in some way at the right time and in proper quantity to blow the lighter material away from the heavier gold," which seems sufficiently obscure.

THE former ruling admitting patent on groups of mining claims, on one of which $500 worth of work had been done, was superseded by a new ruling Dec. 17th, '97, making it necessary to have $500 worth of work done on each claim, whether alone or a part of a group, before patent would issue. Subsequently this ruling was suspended until July 1st, '98, applying only to patents issued up to and including that date.

IN a system of mine timbering care should be taken in framing the joints, but the greatest care exercised in this direction by experienced carpenters is lost if the timbers are not properly placed in the mine. A very important matter, if not the most important, is to give careful attention to wedges when the timbers are in position. Not only is it necessary to properly and firmly drive the wedges when first put in position, but they should receive attention from time to time, to see that they do not become loosened by the shifting of the ground. In some large mines, where the excavation of large masses of rock weakens the ground and causes it to shift, or where there is swelling ground, men are detailed whose duty it is to look after the wedges and see that they remain firmly in place.

MANGANESE is usually found associated with iron, it being rare to find one without some trace of the other. The most common ores are oxides and carbonates. The sulphide (alabandite) is an uncommon mineral. In the United States it is found in Arizona and in Colorado, but nowhere in large amount. It is supposed that the scarcity of the sulphide of manganese is due to the instability of compounds of sulphur and manganese.

THE copper ores of the United Verde mine, Arizona, occur in Algonkian rocks; those of Bisbee, Globe and Clifton in rocks of Palæozoic age. The copper-bearing rocks of the foothill section of California occur in Cretaceous or Jurassic rocks in contact with diabase or serpentine; those in Shasta county, Cal., in eruptive rock-quartz porphyry. In the Lava Beds of San Bernardino county, Cal., rich copper ores also occur in quartz porphyry.

THE great gold-bearing zones of the Black Hills are in Algonkian rocks (formerly classed as Archæan) and are among the oldest gold-bearing veins in the world. Those of Cripple Creek are in a late Tertiary eruptive formation—andesite breccia. The existence of detrital gold in the conglomerate at the base of the Cambrian series in South Dakota proves the Algonkian veins to have been gold-bearing before the Cambrian was deposited, thus establishing their great age.

CALIFORNIA has furnished about one-sixth of all the quicksilver production of the world. In that State the ores occur chiefly in a form of mineral deposit peculiar to the ores of that metal, and which have been described by Geo. F. Becker as chambered veins, being found along complicated systems of fissures and zones of fracturing, often of great extent. These deposits usually occur in the vicinity of eruptive dykes; at New Almaden, a rhyolite; at Sulphur Bank, with basalt.

THE reporting of the international yacht race near New York City by wireless telegraphy was done from the deck of an accompanying steamship by Signor Marconi, the discoverer of the system. A vertical signal wire, 140 feet above the water, was attached to the vessel's foremast. Messages were correctly transmitted fifteen miles at the rate of sixteen words per minute and immediately transmitted by cable and land wire so that New York, London and other places simultaneously received the dispatch.

THE meeting on the 23rd inst. of the California State Miners' Association will be the eighth annual convention of that organization. It will be held at Golden Gate Hall, Sutter St., San Francisco. Questions of importance to the mining industry will be discussed and officers elected. The work of the Association goes on through its executive committee and officers through the year. The annual convention hears reports from those who have been working, and largely decides what the work shall be for the ensuing year.

WHERE A locates a lode claim and complies with all the requirements of the law, and B, coming after him, locates a claim including a large portion of A's claim, and proceeds to patent; having obtained a patent, A has no recourse unless he can prove that B obtained his patent by fraud. B cannot obtain a patent without due form of legal process, including the publication of a notice in a paper nearest the claim, and it is A's business to know that no one has jumped his claim. The United States deputy mineral surveyor is not supposed to know anything about A's location officially. He makes a survey of B's claim from data furnished by B, and has no interest in other claims in the vicinity.

RUTILE is a mineral of somewhat variable composition, but consists essentially of titanium dioxide—oxygen 40, titanium 60. Iron is usually present up to 10%. It occurs usually in the form of prismatic crystals, with the faces vertically striated or grooved. Occasionally found compact and massive. It is almost as hard as quartz, luster metallic-adamantine; color reddish brown passing into red; sometimes yellowish, bluish, violet, black, rarely grass green. By transmitted light deep red, streak pale brown. The ordinary mineral is red and other shades not black. It is often observed in the form of fine needle like inclosures in quartz crystals. It occurs in granite, gneiss, mica, slate, and syenitic rocks and sometimes in granular limestones and dolomite.

ANY person who is a professional mining engineer, geologist, metallurgist or chemist, or persons practically engaged in mining, metallurgy or metallurgical engineering are eligible to membership in the American Institute of Mining Engineers. Associate members include all suitable persons who are desirous of being connected with the Institute and duly elected. Each person desirous of becoming a member or associate shall be proposed by at least three members or associates, approved by the council, and elected by ballot at a regular meeting (or by ballot at any time conducted through the mail). A printed form—proposal for membership—bearing the name of the person whose name is to be proposed and signed by three members of the Institute is forwarded by mail to the Secretary who submits the proposal to a ballot of the members. A membership fee of $10 must accompany such proposal. Information as to the publications of the Institute may be obtained by addressing the Secretary, R. W. Raymond, 99 John St., New York City.

TELEDIAGRAPH is the name given to the apparatus invented by E. A. Hummell of St. Paul, Minn., for the telegraphing of pictures. The picture to be sent is first drawn on tinfoil with a certain kind of ink which will not easily blur by rubbing. The foil is then wrapped around a cylinder in the sending machine, similar to the wax cylinder of a phonograph. At the receiving end is a similar device arranged to work synchronously with the sending apparatus; but instead of tinfoil, a sheet of carbon or manifold paper is placed between two blank sheets of paper. In the sender a needle or platinum point is made to trace its way over the surface of the tinfoil, automatically moving down the cylinder a certain distance on the completion of each revolution. As this needle comes in contact with the ink lines it is thereby raised from the metallic surface and the circuit is broken. At the receiving end a corresponding needle reproduces the pulsations of the needle in the transmitter, and, pressing against the sheet in contact with the carbon paper, traces upon it an impression of the desired picture.

The Copper Queen Mine, Arizona.*

NUMBER II—CONCLUDED.

By JAMES DOUGLAS, Gen'l Mgr. Copper Queen Mine.

Though, as a rule, the clays of the ledge matter are ferruginous, they enclose here and there masses consisting of pure white clay, so free from iron as to be suitable for the plastic material of of converter linings. Such white clays may have been originally partitions of pure limestone between masses of sulphuretted ore, blocks of limestone intercalated in the ore, which we assume the ledge matter to have originally been.

If, therefore, we assume that the ledge matter represents or replaces ore as originally deposited, in what condition was that ore, and through what process of alteration has it come to assume its present composition and appearance? It has been suggested that the ledge matter is an altered feldspathic rock in place; that this intrusive rock carries the ore; and that the ledge matter and the ore, as found to-day, are merely instances of alteration. It is difficult to conceive how irregular, isolated masses of intrusive rock could be injected into the limestone so as to fill the space occupied by the ledge matter; but a more cogent reason for questioning the correctness of the theory is the fact that outside of, and below, the area of alteration we find no such bodies of copper-bearing "porphyry" (to use the popular term) as the theory calls for; whereas we do find large bodies of unaltered copper-bearing iron pyrites in contiguity with the altered bodies.

Fig. 2 is a cross-section through altered and unaltered ore bodies.

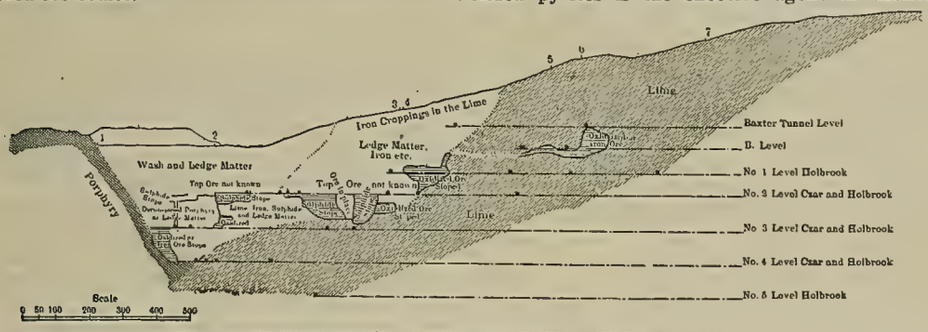

FIG. 2.—CROSS-SECTION COPPER QUEEN MINE, ARIZONA.

One or more granite veins traverse the limestones of the Queen hill, and even cut through, without appearing to affect, the ore bodies; but these veins are barren. They have not been traced from the surface, but they correspond approximately in position and direction with heavy quartzite croppings, which break through the limestones near the crest of the hill. If the surface quartzites and the deeper granites belong to the same system, this instance would confirm the evidence presented elsewhere, that feldspathic rocks, under such potent influences of decay as exist in the Southwest, lose all their basic ingredients at, or near, the surface, and are altered into very acid felsites, or even quartzites. We have used the decayed granite on the 400-foot level as plastic lining for the converters.

With regard to the ledge matter and the oxidized ore, my own opinion is that they are the product of replacement and local concentration; that where there is ledge matter to-day, there was, originally, more or less compact iron pyrites carrying a small percentage of copper; and that, during the process of alteration, not only did ferruginous solutions of alumina replace the pyrites, but the copper, by a process of segregation akin to crystallization, was concentrated and collected into areas of limited size, thus constituting the comparatively small bodies of oxidized ores which are disseminated irregularly through the very large masses of ledge matter. The acid products of decay thus liberated must have been enormous. As the outline of the masses of ledge matter has never been traced, it is impossible to determine their actual size, and thus arrive at an accurate estimate of their quantity; but, approximately, there has been exposed on all the levels above the 400-foot level not less than 10,000,000 tons of ledge matter. If this was, before alteration, a sulphide ore of the average composition of the existing unaltered masses, there must have been set free at least 4,000,000 tons of sulphur. That the ore before alteration was as compact, and therefore carried as high a percentage of sulphur, as the existing unlatered ore, may be doubted. It is possible that one reason why the sulphide ores of to day on the upper levels are only partially decayed is that they were composed of more compact pyrites than the ores which have been completely altered and are imbedded in ledge matter. In any case, assuming that the ledge matter and ore represent sulphuretted compounds now altered, there must have been oxidixed and rendered soluble more than a million tons of sulphur, which would be sufficient to produce widespread alterations in the adjacent limestones and hasten decay in the ore masses themselves; to reach by diffusion the adjacent eldspathic rocks; to alter them, and to carry back some of their basic constituents and silica to replace dissolved elements of the limestones and ores.

As I have already pointed out, the limestones themselves which enclose the ledge matter are extensively altered. As the result of such alteration, there must have been produced correspondingly large quantities of sulphate of lime. Through the percolation of water this has been completely dissolved and removed. In dryer mines, such as those at Globe, small quantities of gypsum are found; and in such extremely dry regions as that in which the Boleo mines of Lower California are situated, gypsum accompanies the oxidized copper ores in such quantities as to convert the furnace product very largely into matte. At Bisbee, however, where the ledge matter is everywhere wet, where fissures and caves afford channels for the flow of water, and where, during the wet season, our pumps have to handle from one to two million gallons of water a day, even such sparingly soluble products of decay as gypsum have been dissolved and have disappeared.

It is more difficult to account for the enormous quantities of alumina which must have been derived from extraneous sources to form the clays. They must have been derived and conveyed by diffusion from the adjacent feldspathic rocks. As I have already remarked, when we drift from the limestones into the feldspathic rocks, assumed to be rhyolite, to the east, it is impossible to distinguish the difference between altered limestone and altered rhyolite. But in the distinctly feldspathic rocks we find that widespread decay, though less destructive, has occurred. As this rhyolite carries more or less iron and copper pyrites, it may be argued that the enclosed pyrites is the effective agent in assisting decay. But except at the surface, where the rhyolite is colored, the pyrites is undecomposed. Below the surface the rhyolite is white and softened to considerable depth. It is therefore quite conceivable that, by means of the insensible interchange of solutions from the decaying bodies of pyrites through the adjacent feldspathic rocks, alumina and a silica should be dissolved, and that they, in their turn, should displace the carbonate of lime and replace some of the iron in the altered pyrites.

At the Copper Basin in Yavapai county, Arizona, a copper solution oozes from feldspathic rocks which carry only a trace of copper. On exposure to the air, there separates in the bottom of the streams an insoluble magma, the solid constituents of which are:

	Per Cent.
Silica	7.17
Fe_2O_3 and Al_2O_3	16.21
CuO	64.40
SO_3	12.22
Total	100.00

In time this sludge is converted into a mixed carbonate of copper and alumina, which binds together the gravels into conglomerates, of which some twenty thousand tons constitute horizontal beds of copper ore. The alumina and silica are in this case dissolved from the granite, through which percolate the soluble products of the decay of copper and iron pyrites.

A feature of the Bisbee mine is the large caves, which have had some influence on the occurrence of of the oxidized ore bodies. The walls, roofs and floors of these caves are always covered with stalactitic accretions, which are often tinted green, blue and red by the copper and iron solutions which are mixed with a solution of carbonate of lime. What, however, gives these caverns practical interest is that they have invariably covered oxidized ore bodies. Fig. 3 gives a cross-section through one of the large caves. Three such caves of considerable extent have been encountered, and in every instance this combination has occurred. It may be accidental; but so satisfied are we to the contrary that when a cave is now met with, drifts are run beneath it to strike the ore body. It is a fair assumption that the cave, if not originally formed by the contraction of an ore body, was increased by the shrinkage of the latter during its oxidation, and that, therefore, a genetic relation really exists between the cave and the underlying ore.

Moreover, some real, and not accidental, relation can be traced between the surface contour of the country and the underlying ore bodies. Where the ore bodies have come to the surface, and have been decayed into ledge matter, erosion has been extensive, as in the case of the depression east of the Copper Queen hill, through which the Arizona and Southeastern R. R. enters the town, and in which the slag dump is being deposited. This depression, already observed, marks the line of contact between the limestones and the rhyolite. The fissure between the Copper Queen hill and Copper King hill to the west uncovers the deposit of cerussite which attracted attention to the district before the copper; and this gulch may occupy the position of ore bodies which, there is reason to think, have been completely removed by denudation. South of the Copper Queen hill there is a broad depression which corresponds roughly to the ore-bearing ground in depth. It would be drawing an unwarrantable conclusion to predict the position of an ore body from the surface contour of any country; but where the rocks are known to be ore-bearing, it is often as fair an assumption that surface elevations and depressions represent ore bodies in depth as that the colors of soils and rock are indicative signs.

The metallurgical practice has necessarily undergone radical modifications with the change in the character of the ore; and the plant has also grown, both in size and in the dimension of its separate parts, with the expansion of the mine. The water-jacketed furnace which was introduced when the mine was opened by Mr. Lewis Williams, who was probably the first metallurgist to apply it to copper smelting, has remained the type of furnace used; but the 36-inch round shell has, by successive changes, developed into furnaces of 122 inches by 42 inches. There is no other reason for confining them to this size than that the capacity of such a furnace is approximately that of the converters, which are coupled with the furnaces. Originally the furnace plant, consisting of two 36-inch jackets, was built directly below the open cut, and the ore was crushed under a separate roof, thus involving unnecessary handling; but in 1886–1887 the smelting works were removed to their present site, though they were still planned for the treatment exclusively of oxidized ores. Already, however, the percentage of sulphur in the oxidized ores was increasing to a degree which injured the quality of the black copper bars, and involved the retreatment of part of the product as matte. Simultaneously large bodies of compact sulphurets were being discovered, the utilization of which involved a change of treatment. By that time the pneumatic method of concentrating matte had acquired such undisputed acceptance in Butte that the company decided to adopt it; but, instead of building the vertical converter, which had heretofore been exclusively used in this country, the horizontal barrel type was copied, with modifications, from those in use at the metallurgical works in Leghorn, Italy, at Aiguilles, France, and at Vivians' works in Swansea, Wales.

At first the converters were fed from a remelting furnace, but this wasteful operation was soon abandoned, and each of the three converters was placed opposite its companion smelting furnace, and the molten matte was poured from tilting wells directly into the converters. This plan secured notable economy over the cost of remelting, with its attendant handling of the cooled matte, but was found to involve occasional delay—at one time of the furnaces, at another of the converters—so that neither furnaces nor converters could be pushed to their maximum capacity. An electric crane is therefore being introduced to transport the matte from any one of the furnace wells to any one of the converters. The smelting plant of the mine will hereafter consist of four water-jacketed cupolas, 42 inches by 120 inches, of oval shape, and with taper from the feed door to the tuyeres. Each furnace is provided with two tilting wells, arranged in tandem. From the second well the slag will flow into two-ton ladles, which are moved by the electric crane to the four-ton slag cars, drawn by a steam locomotive. The matte will be poured from whichever of the tilting wells of

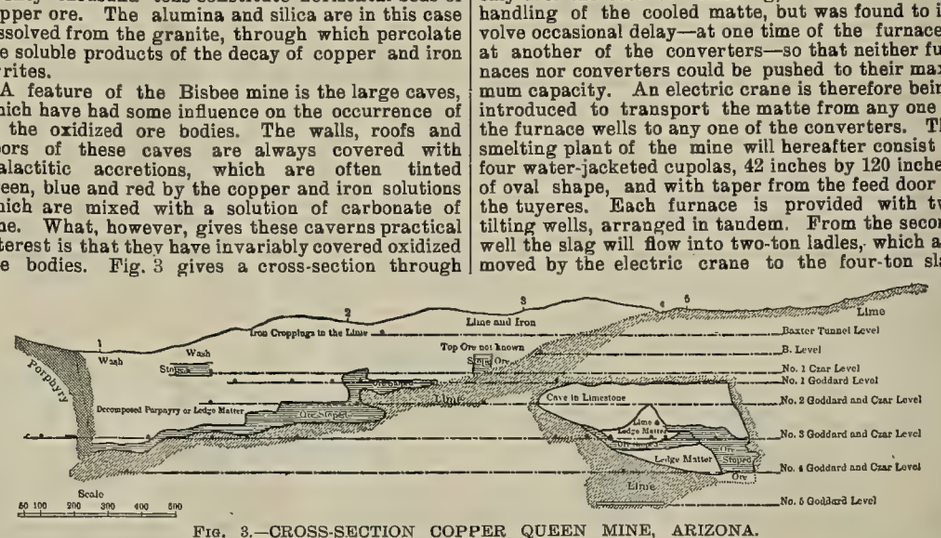

FIG. 3.—CROSS-SECTION COPPER QUEEN MINE, ARIZONA.

each furnace is quite full, and conveyed to a converter; and the same crane will return the converter slag to the well nearest to the furnace, thus allowing the slag ample time and space to settle while traveling to the discharge of the second well. The converters are 8 feet long and 5 feet 6 inches in diameter. The average daily capacity of each furnace is about 160 tons of ore, exclusive of extra charge of foul slag, and each converter can blow daily thirty to forty tons of 45% matte to metallic copper, averaging a trifle over 99%. The blast is derived either from a horizontal duplex Riedler engine or a vertical Scranton engine. The pressure usually maintained is from seven to eight pounds. While the matte can be blown at much lower pressure, a lower blast retards the operation.

In "Mineral Resources of the United States" for 1883–1884 I described the construction and operation of the old 36-inch jackets then treating the oxidized ores of the mine.

At present a charge of the large 42x120-inch furnace is composed of naturally oxidized ores mixed with sulphuretted ores in such proportion as to yield a matte of about 45%. The following samples of ore charge and slag were taken during a day's run of the same furnace. Each ore charge consisted of:

	Lbs.
Oxidized ores from various parts of the mine, carrying more or less sulphur	1,500
Low-grade clay ore	1 000
Raw sulphide ore	1,000
Roasted sulphide ore	100
Total	3,600

One charge of briquettes, made from fine ore screenings, flue dust and coke dust, in a Chisholm & Boyd brick press, is fed for every ten charges of ore. The coarse screenings from the converter are added as extras—hence the larger proportion of silica in the slag than the composition of the ore charge would warrant.

ANALYSIS OF ORE CHARGE.

The dry copper content was, therefore, 8.27%. This, of course, represents not the average run of the mine, but selected ore, as rough sorting is done underground. No flux is ever added to the furnace charge, as by a judicious selection of acid and basic ores a fusible mixture can always be obtained. The coke consumption is 12.5% of burden of furnace. The coke used is a very impure product of the Trinidad, Colo., ovens, carrying over 20% of ash, but the furnace charge is sufficiently basic to permit its economical use.

The operation of one of the converters when fed from a single furnace, involving, as already stated, a considerable waste of time, can be followed by tracing the steps of the life of a single lining, as in the following table; and the behavior of the principal ingredients of the matte is indicated by the analysis and the products of the blow:

Samples of Products of Bessemer Converter No. 3, at Bisbee, During the Life of One Lining.

NEW LINING—FIRST CHARGE.

First tap of matte from well No. 3. Blast turned on at 12:13 P. M.; blast turned off at 12:28 P. M. Time of first blast, 15 minutes.

Pour finished at 12:33 P. M.

Second blow began at 12:52 P. M.; second blow ended at 1:20 P. M. Time of blow, 28 minutes.

Third blow began at 1:30 P. M.; third blow ended at 1:58 P. M. Time of blow, 28 minutes.

Bullion all poured at 2:06 P. M.

Length of blast on charge: First blow, 15 minutes; second blow, 28 minutes; third blow, 28 minutes. Total, 1 hour 11 minutes.

Sample No. 1—First tap of matte into converter; ladle at beginning, middle and end of tap.

Sample No. 2—First pour of slag, 4½ pots; dip sample, two rods to each pot.

Sample No. 3—Ladle sample of white metal from converter.

Sample No. 4—Second tap of matte into converter from well No. 3.

Sample No. 5—Six pots, poured slag.

Sample No. 6—Two pots, skimmed slag.

Sample No. 7—White metal from converter.

Sample No. 8—Metallic copper; ladle sample taken near beginning and end of pour. Copper made from this charge, 9½ bars.

[Sample No. 2 probably too high, as dip of rods from last pot was too deep.]

SECOND CHARGE OF CONVERTER.

First tap of matte from No. 3 well into converter.

First blow began at 2:20 P. M.; first blow ended at 2:48 P. M. Time of blow, 28 minutes.

Second blow began at 3:12 P. M.; second blow ended at 3:37 P. M. Time of blow, 25 minutes.

Third blow began at 3:50 P. M.; third blow ended at 4:32 P. M. Time of blow, 42 minutes.

Length of blast on charge: First blow, 28 minutes; second blow, 25 minutes; third blow, 42 minutes. Total, 1 hour 35 minutes.

Sample No. 9—First tap of matte taken as for sample No. 1.

Sample No. 10—First pour of slag, 10 pots.

Sample No. 11—White metal in converter, end of first blow.

Sample No. 12—Second tap of matte from well No. 3 into converter.

Sample No. 13—Second pouring of slag, 9 pots.

Sample No. 14—Two pots skimmings.

Sample No. 15—White metal, end of second blow.

Sample No. 16—Taken like sample No. 8; 14½ bars of metallic copper.

[Converter lining patched with one wheelbarrow load of lining after this run.]

The converter lining used in Bisbee is composed of quartzite and clay from the mine, the latter carrying a small percentage of copper. No ore sufficiently siliceous, and, at the same time, sufficiently plastic, has been found at Bisbee to serve as lining; but at Morenci an ore with an average composition of 54% SiO_2 and 20% Al_2O_3 is used to line the body of the converter. A more siliceous mixture is preferred for the zone of the tuyeres. The small quantity of gold and silver, which the above analyses reveal, comes from every section of the mine—a certain stope containing more on one day than on another day. For a time a selection was made, one converter and one furnace being run on the more highly argentiferous ore, and bars of slightly higher tenor in gold and silver were made from them; but the difference between these and the average was too small to encourage us in continuing the practice. No roasting is actually needed; but two cylinder calcining furnaces are kept running on very heavily sulphuretted ores, extracted chiefly during exploration. The furnaces are automatic and self-roasting. Each handles eight tons of coarsely crushed ore a day, reducing the average sulphur contents from 45% to 8%.

The power plant of the works, like that of all plants built up by installments, is very defective. No steps are being taken to improve it, because the company contemplates building in the near future a large gas producer and a gas engine plant, the experience of both the Arizona Copper Co. and the Detroit Copper Mining Co. having been overwhelmingly and unreservedly favorable to that mode of generating power, at least under the local conditions here existing.

THIRD CHARGE OF CONVERTER.

First blow began at 5:10 P. M.; first blow ended at 5:41 P. M. Time of blow, 31 minutes.

Second blow began at 6:10 P. M; second blow ended at 6:35 P. M. Time of blow, 25 minutes.

Third blow began at 6:45 P. M.; third blow ended at 7:26 P. M. Time of blow, 41 minutes.

Length of blast on charge: First blow, 31 minutes; second blow, 25 minutes; third blow, 41 minutes. Total, 1 hour 37 minutes.

Sample No. 17—First tap of matte taken from settler No. 3, taken like sample No. 1.

Sample No. 18—First pour of slag, 10 pots.

Sample No. 19—White metal, after first blow.

Sample No. 20—Second charge of matte from No. 3 well into converter.

Sample No. 21—Nine pots slag, second pour.

Sample No. 22—Two pots skimmings.

Sample No. 23—White metal, after second blow.

Sample No. 24—Metallic copper, 14½ bars, taken like No. 8.

[Converter lining reinforced with one wheelbarrow load of lining after the run.]

FOURTH AND LAST CHARGE OF CONVERTER.

First blow began at 8:43 P. M; first blow ended at 9:09 P. M. Time of blow, 26 minutes.

[Had to wait nearly an hour for matte, as No. 3 furnace had been run down.]

Second blow began at 9:19 P. M.; second blow ended at 9:56 P. M. Time of blow, 31 minutes.

Total time of blast: First blow, 26 minutes; second blow, 31 minutes. Total, 57 minutes.

Product, 52 bars; weight, 15,070 pounds.

Sample No. 25—Matte (only tap) poured from No. 3 well.

Sample No. 26—Nine pots slag poured.

Sample No. 27—One pot of skimmings.

Sample No. 28—White metal in converter after first blow.

Sample No. 29—Metallic copper, 12 bars.

Sample No. 30—"Granulated slag," 2 pots grab as raked out.

Sample No. 31.

Sample No. 32.

[In blowing up the charges to white metal there were always some fumes coming from the converter. But the fumes were very much heavier than usual in the last charge. In fact, there were very dense fumes — probably lead—through almost all of the time of the first blow on the fourth charge.]

* The figures for silver and gold, in parenthesis, represent ounces per ton.

An examination of the above statement shows that 10 hours 43 minutes were consumed in making 15,070 pounds of copper, in four charges, or 2 hours 40 minutes per charge. To this, 20 minutes must be added for the time allowed for changing converter shells.

Of this time, the first charge was blown up to copper in 1 hour 11 minutes; the second, in 1 hour 35 minutes; the third, in 1 hour 37 minutes, and the fourth, in 57 minutes. Total, 5 hours 20 minutes.

The skimming and second matte filling actually occupied 34 minutes for the first charge; 37 minutes for the second; 39 minutes for the third, and the skimming of the fourth charge occupied 16 minutes. Total, 2 hours 6 minutes.

The difference of 3 hours and 17 minutes, or 49 minutes per charge, was therefore spent in pouring copper, patching and charging,—an excessive allowance, due in part to the system, otherwise so economical, of linking a furnace to one converter, as previously explained.

The Newest El Dorado.

Three years ago the MINING AND SCIENTIFIC PRESS illustrated and described the newest found gold fields of the dreary Yukon region. From other regions, drearier and still farther toward the reign of ice and night, comes confirmation of rich gold finds at Cape Nome, Alaska, and already are reported the usual "rushes" toward the bleak spot where men who are believed to be reliable write us gold is plenty.

Cape Nome is said by returned visitors to be "the coldest and windiest place on earth." Norton sound

BEACH DIGGINGS NEAR ANVIL CITY,—$3,600 TAKEN FROM THIS CLAIM IN THREE WEEKS.

freezes over and the ice piles up high on the beach. The beach is a summer sluicing proposition, and no place for any white man to want to winter. This season there were about 2000 people working with rockers on the beach, some taking out $25 per day, others $100. The diggings are shallow, the deposit extending along the beach for twenty miles. The "formation," etc., have heretofore been described at length. Nuggets worth $300 have been found, the most of the gold being fine. As often happens, it was "tenderfeet" who made the discovery. Two boys who had never handled mining implements began "working" out some grey sand in front of the store tent of the N. A. T. Co., and found "wages." Near by a man who had a tent near the beach, wanting to build a "porch," sunk a hole for a post, and found hardpan at a depth of 2 feet. On this clay hardpan was a layer of 3 inches of ruby sand, full of fine gold. That started a lively securing of claims. At first the Transportation Co. wanted to monopolize the beach, but found it impossible, the rocker men claiming and maintaining a right to a 30 foot strip above high water. Miners say that not more than half the gold is saved; it is very fine and is found in black or ruby sand on a thin layer of clay, from off which the black sand is scraped. No one goes below the second stratum of this clay lest the water come in upon him. The rockers and work are crude, some of the gold is rusty and will not hold to the plates, the black sand is sometimes nearly as heavy as the gold, so that the saving is not more than 50% of the gold actually present. Anvil City will be a lively place next season, when considerable of Dawson City's present population will have left the Canadian El Dorado of '97 for the newest El Dorado on American soil. The chief charm about Cape Nome is that, unlike Dawson on the Klondike, it is a poor man's camp, and for a while at least no one has any advantage. The MINING AND SCIENTIFIC PRESS of April 22 had an account of the discovery and organization of the Cape Nome district, and gave the first authentic account from miners of that region.

Herewith and on page 457 are presented some views specially engraved for the MINING AND SCIENTIFIC PRESS, which portray more faithfully than can any description just how the gold is being won from the water's edge. It is on a bigger scale just what has been done for forty years along the California and Oregon coast. In the latter case the richest results were always after a great storm had "concentrated" the surface sands and made a little rich pocket of beach sand that paid well. In the case of the Cape Nome beach diggings the ocean shore is rich in gold dust and nuggets partially protected from the tides and storms by the overlying sand, being the disintegration of the mountains seaward, and indicating a "mother lode" inland. It is probable development will show that the whole expanse of tundra from the Cape Nome beach clear back to Anvil creek is a gold-bearing plain similar in formation and scarcely less rich in gold than the slice of beach which the ocean has been cutting away. Anvil City, the most northern American town, may prove as big a shipper of gold as was its waning competitor on the Canadian side of the Yukon.

The United Verde, Arizona.

The largest copper mine in the southwestern United States, and one of the richest in the world, is the United Verde at Jerome, Yavapai county, Arizona. The district was discovered in 1875 by a party of prospectors who made numerous locations on the hills where the great copper mines now are, among them some of those now forming the United Verde group.

During the following seven years the original locators did development work on some of the claims, and in 1882 sold their interest to ex-Governor Tritle of Arizona and F. F. Thomas of California for $15,000. A thirty-ton smelter was built in the early summer of 1883, which was run continuously for a year or more. Up to October, 1884, the smelter had produced in 289 days 4,396,951 pounds of metallic copper and 237,951 ounces of silver. The copper was worth at that time 12½ cents per pound and the silver about $1 per ounce. In December, 1884, a new furnace was purchased and there was an intention to increase the capacity of the works, but the constantly decreasing price of copper discouraged the enterprise; and this, together with the expense and difficulty in obtaining coke during the following winter, and also to the fact that sulphides had commenced to make their appearance in the mine, led to the closing down of the property, as the situation at that time did not appear to justify the reconstruction of the works or additions thereto. The property remained idle until the summer of 1887, whenex-Governor Tritle took it under lease, and in August of that year the furnaces were again blown in and a successful run was made lasting several weeks. In the fall of the year the works and mine were again closed down.

In March, 1888, W. A. Clark of Butte, Montana, came into possession of the United Verde, which at that time had a reduction plant of 100 tons daily capacity. Since the early attempts to work the property, a railroad had been built from Seligman Junction, on the line of the Atlantic & Pacific, to Prescott, passing within twenty-two miles of the mines, greatly simplifying the transportation problem. Copper had also gone up in price to about 16 cents per pound. In the following May the furnaces were once more blown in under Mr. Clark's management, and then began the successful history of these mines. From time to time additions and improvements were made to the plant, and at the present time the property is thoroughly equipped with modern machinery

UNITED VERDE SMELTERS, JEROME, ARIZONA.

and labor-saving devices, which have enabled it to make a large output at nominal cost.

The plant now has six water-jacket furnaces, having a capacity of 200 tons each, a reverberatory furnace of ordinary type, one tilting furnace and six converters. A battery of ten boilers, having in the aggregate a capacity of 1500 H. P., furnishes power for these works. A complete electric plant has also been installed. Cranes and travelers handle the matte, conveying it from the furnaces to the converters and also carrying the bullion from the converters to the refining furnace. The slag pots are handled by electric motors, and everything about the mine and reduction works is conducted on a large scale. The mines are making an annual output approaching 40,000,000 pounds of refined copper and several hundred thousand ounces of silver, the enterprise giving employment to nearly 1000 men.

The accompanying illustration, from a photo specially taken for this article, is a general view of the reduction plant, showing also the company's offices and workmen's cottages.

Liquid Air—Some Fallacies, and a Few Facts.

Written for the MINING AND SCIENTIFIC PRESS by GEO. S. BINCKLEY.

In the first place, liquid air is not stored energy at all. On the contrary, it contains not nearly as much potential energy as the same weight of ice.

Its expansive power is less than that of water. In other words, its ratio of expansion is lower; consequently, in the evaporation of equal volumes of liquid air and water to greater but still equal volumes of air and steam, more work will be performed by the expansion of the steam than the air.

In the production of the liquid air, the work performed in the compression of the air from atmospheric pressure to that required for liquefaction must always be in excess of that represented by the expansive power of the liquid air, owing to the fact that the compression of the air cannot be isothermal, that there are losses of power due to the clearance spaces in the cylinders, leakage and friction in the machine itself. Taking all these matters into consideration, it will be seen that even with the most improved machinery there will always be very considerable losses, thermal and mechanical. Eliminating these losses, we would have an exact balance in the amount of power exerted and in the power available in the form of liquid air.

In the liquefaction of air, the result to be attained is not the storage of energy in the air, (although this is the preliminary step), but the extraction of almost all the potential energy that it contains at atmospheric pressure and ordinary temperatures, reducing it from the state of a gas to that of a liquid, having an extremely low temperature, and, consequently, little energy. In this state it has, very naturally, a great capacity for the rapid absorption of heat, from the surrounding air or anything else near it, until a thermal equilibrium is reached. During the establishment of this equilibrium the liquid will expand as a vapor and, if confined, will exert a corresponding pressure, which may be utilized in an engine of the ordinary form. It derives its energy, however, from the surrounding atmosphere, the energy stored in it during compression having been entirely dissipated during liquefaction.

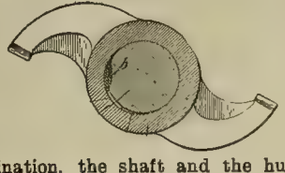
In the liquefaction of air, the purpose of compression is to concentrate the total heat or energy existing in the air into a small volume, the temperature of which is first reduced by the application of cold water to the tubes forming the receiver, and further reduced by allowing air, at ordinary temperatures but under high pressure, to expand around the receiver. This air, having been deprived of a great part of its energy, will, on expanding, absorb from anything that it comes in contact with the amount of heat necessary to establish a thermal equilibrium, and, in doing so, will further reduce the temperature of the air under pressure. Carried far enough, this will produce liquefaction, the liquefied air having parted with as much energy, or heat, as was expended in its liquefication.

Mr. Tripler, who has accomplished the most conspicuous results in the way of liquefication of air, and who has written about it a good deal, says that after the process is begun and the temperature in the condenser brought to a sufficiently low point, the compression of the air before liquefication will not be necessary, but that the air will condense at atmospheric pressure, fresh air rushing in as the process of condensation goes on. This would undoubtedly be true if the temperature in the condenser was maintained at the same low point; but the heat in the inrushing air must be absorbed by something, and no matter how short a time is assumed, the change of temperature of the condensing surface will necessarily be immediate, and will continue until a thermal equilibrium shall have been established. To maintain the condensing surface at the same low temperature, the expansion of air or gas from a

high temperature is necessary in order to absorb the heat carried by the in-rushing air, and the energy stored in this air or gas and dissipated by its expansion is equal to the energy that it will absorb from the air condensed and liquefied, assuming that the process is perfect, which it, of course, cannot be. This is a simple matter, in the face of which it is difficult to accept Mr. Tripler's statement that, with the expenditure of three parts of liquid air used as a source of power in an engine, he can produce seven parts of fresh liquid air. He says that in the process of liquefaction he "does not know what becomes of the heat;" but the writer is of the opinion that, if he will make careful experiments, instead of deductions from false premises, he will find out. Assuming that his statement is made in good faith, it would be perpetual motion of an aggravated type, and it is as reasonable to suppose that a man can lift himself by his bootstraps as that nature will fail to establish an equilibrium of temperatures.

Pressure and heat are as tangible elements in a problem of this kind as weights and volumes are in problems dealing with the movement of water, and, as water seeks its own level, so do the temperatures of two bodies placed near each other tend to an equilibrium if they differ at first. The problem of liquefaction of air deals with the dissipation of energy, but the dissipation of a certain amount of energy below the plane of equilibrium is equal to the accumulation of the same amount above this plane, which is represented in this case by atmospheric pressure and ordinary temperatures.

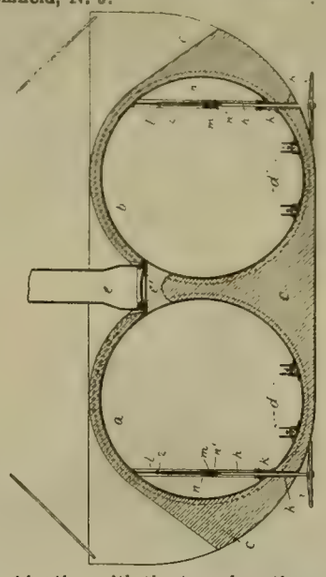
Turning from the theoretical considerations of the question to the probability of practical utility, the outlook is rather encouraging. In the first place, it has been demonstrated that the liquid may be transported with comparatively small loss, and if proper means were taken to prevent radiation and the liquid stored in spherical reservoirs, it is reasonable to conclude that the loss from radiation would be slight. It will remain liquid at atmospheric pressure, if the temperature is kept at a proper point, and there would be an excellent economy in the operation of an engine using it if the cylinders were heated and a high ratio of expansion employed. There could be no trouble from freezing, as liquid air is as dry as a bone, and the small amount of heat necessary to keep the cylinders warm would be directly converted into work with very small waste indeed, and if multiple cylinder engines were used and the air thoroughly heated in the jackets and receivers, as well as in a pre-heater, there might be a high degree of economy shown in the utilization of liquid air as an absorbent and vehicle for the transformation of the heat of the atmosphere into useful work. This is its only function as a "source of power."



Owing to the fact that the evaporation of liquid air and the attainment of high pressure does not involve the application of higher temperatures than commonly exist in the atmosphere, higher ratios of expansion may be used in an engine using it than in the steam engine, and the absence of heavy boilers and fuel supply would seem to make this method of indirect power transference of value in street car propulsion and possibly for automobiles and in aerial navigation. Not enough has as yet been done in the production of liquid air to be able to say what its relative economy will be as a system; but it may easily be that, with improved methods of production and earnest study of the subject, good results will be shown. In its sphere, there is reason to think that liquid air may be of great advantage in many ways; but its sphere is limited at the best, and further developments may tend to draw the limits closer than seems probable at this time. There is small reason for the enthusiasts to blind themselves to the facts, for there is nothing mysterious about the liquefaction of air, and there has been no development so far to shake one's faith in the results of years of patient experiment and investigation by the world's most famous scientists and engineers.

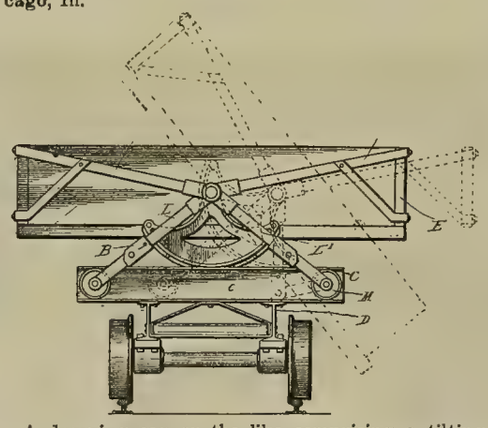
Latest Mining and Metallurgical Patents.

Patents Issued Oct. 10, 1899.



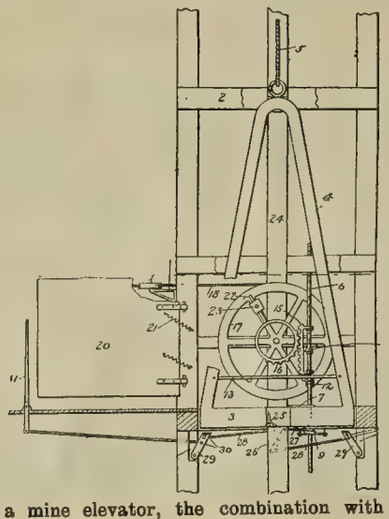
Specially Reported for the MINING AND SCIENTIFIC PRESS.

CAM OR PULLEY FASTENING.—No. 634,660; W. C. Davis, Denver, Colo.



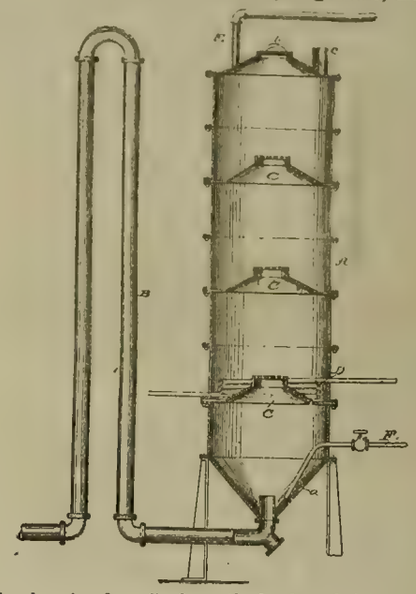
In combination, the shaft and the hub mounted thereon, one of parts having a curved key seat or recess, and a wedge block or key seated in key seat and having a curved outer face, the other part having an eccentric surface corresponding to the curve of the outer face of the key. The shaft having a curved recess therein, the hub having an eccentric groove or channel, and the wedge block having one face curved to correspond to the recess and the other face curved to correspond to the curve of the eccentric groove or channel formed on a curve corresponding to the curve of the key seat, and the wedge block or key having curved faces corresponding to the curves of the key seat and groove, and the wedge block loosely seated in recess, hub having a cut-away portion to permit the entrance of the key.

SUBMARINE TUNNEL.—No. 634,322; C. H. Buckelew, Plainfield, N. J.



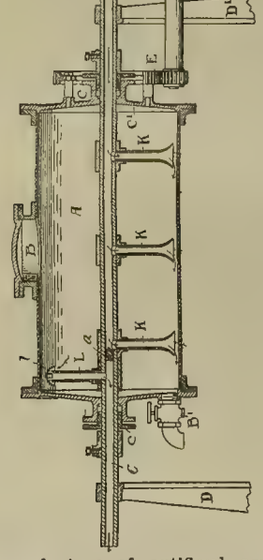
The combination with the tunnel sections of a submarine tunnel, of a bearing plate *i* outside the tunnel section, the shaft *h* connected thereto at the lower end and screw-threaded at the upper end, the sleeve *k* and stuffing box *k'* through which the shaft passes, a frame connected to the shell of the tunnel section and composed of vertical plates *l l'* and a cross-head *m*, nuts *n n'* upon the screw-threaded end of the shaft and at opposite sides of the cross-head *m*, an eye-frame *o* connected to the upper end of the plates *l l'*, an eye 2 at the end of the shaft *h* for a rope to connect and to suspend the shaft and its bearing plate from and by the eye-frame 2.

DUMPING CAR.—No. 634,683; M. G. Bunnell, Chicago, Ill.



A dumping car or the like comprising a tilting body having a rocker base; and a gate for such body provided with break-joint arms which are pivoted to the tilting body and provided with rollers arranged to traverse the guideways, arms being each adapted to break joint one way at a point between its pivotal support and its roller.

DEVICE FOR OPERATING MINE SHAFT DOORS.—No. 634,802; C. Caldwell, Anaconda, Colo.



In a mine elevator, the combination with the hinged spring-actuated door, the oscillating rope wheel, the rope connected therewith and with door, and the cogwheel carried by rope wheel, of the rack bar meshing therewith, the vertical bar carrying rack bar and formed with a vertical groove, the shoe fixed to rod, the plate through which rod passes formed with a key engaging with groove, the bar pivoted to plate, the lever with which it is connected, the rods connected with lever, the pivoted chairs with which last mentioned rods are connected, the hand lever and connecting rod.

METHOD OF REFINING CUPRIC SULPHATE SOLUTIONS.—No. 634,751; O. Hofmann, Argentine, Kans.

The herein-described method of refining crude cupric sulphate solutions, consisting in first neutralizing the solution, then heating it, adding cupric oxide, and finally injecting air into the solution, to precipitate the impurities in the solution. A method of eliminating from a solution of cupric sulphate the salts of iron and other metals like arsenic, antimony, nickel and cobalt contained therein as impurities, by neutralizing and heating the solution, then adding cupric oxide, and injecting air in cupric sulphate solution in which the cupric oxide or oxidized matte is suspended until the iron and other impurities are precipitated.

ART OF MANUFACTURING ASPHALT FROM PETROLEUM RESIDUE.—No. 634,818; J. W. Hayward, Cleveland, Ohio.

In the manufacture of artificial asphalt from petroleum residue, the method of manufacture consisting in mixing pulverized limestone with the petroleum residue while it is in a heated state, and in this state oxidizing the mixture by subjecting it to the diffusion of air.

ART OF SMELTING ORES.—No. 634,566; F. Ballou, Leadville, Colo.

The improvement in the art of smelting metallic ores in stack furnaces herein described, which consists in first saturating coke with water, then charging the furnace with the ore to be smelted and with the saturated coke as fuel, forcing air through the lower part of the charge, and gradually feeding the charge downward to the point where reduction occurs.

Cripple Creek Tunnel Enterprises.

TO THE EDITOR:—In 1896 a decision by the United States Court of Appeals defined the rights under tunnel locations, giving them much wider scope than had been accorded by any prior rulings. The decision was followed by a great number of tunnel locations in Cripple Creek district, many of the locators apparently being prompted by the temptation to take undue advantage of surface claim locators, which the new interpretation of the law was supposed to make possible; as well as by the chance of striking rich ore in the blind leads. A few were located with drainage and ore haulage as the primary purpose, the projectors seeking and receiving the co-operation of surface claimants and avoiding litigation. At any rate, the district was full of tunnels (on paper) and the tunnel promoter, in selling stock, disseminated his inflated idea of the cinch his tunnel would have on the district. At that time, the writer, in an article in the MINING AND SCIENTIFIC PRESS, took occasion to indicate that the tunnel scheme, as it was then being conjured with, would fall far short of expectations as a real mining factor in the district.

Subsequent events have shown that mining sentiment has not sustained the doctrine that then prevailed. Tunnels have been driven to open veins located on the surface and to facilitate operations of well known mines; but the general tunnel proposition, as purely a means of adversing surface locations, has to a large degree lost its popularity in Cripple Creek district. The distinction between this and the enterprises that seek the co-operation of surface holders seems quite clear.

In view of the large number of locations made three years ago as tunnel enterprises, it may be interesting to make a brief summary of some of the tunnel work of the district as it stands to-day.

The Cripple Creek and Gold Hill tunnel enters Gold hill within the limits of the town of Cripple Creek, cutting easterly through the grounds of the Midget, Moon-Anchor and Anchoria-Leland, connecting with the last named workings at 685 feet depth. It is 3035 feet long and is of use in draining those properties.

The Goodwill tunnel, 100 feet lower in elevation than the one described, was driven 3000 feet in a southwesterly course through Gold hill, cutting under the E. Porter Gold King. It has been closed down for many months.

The Ophelia, better known as the Bush-Moffatt tunnel, enters Gold hill at the junction of Cottontail and Cripple Creek gulches, taking a southeasterly course. It was started in 1895, was driven 2600 feet when a strong vein of water was encountered that drained various mines on Gold hill. The water continued to flow till apparently the same channel was struck by the Standard tunnel, in Beacon hill, which diverted the water from the Ophelia, leaving the latter dry. About a year ago work was resumed on the Ophelia tunnel and it is now in about 4000 feet. Its course takes it through the southern portion of Gold hill, under the town of Anaconda, through Raven hill and Bull hill, terminating at the Victor mine, in Bull cliff. The projectors of this tunnel have secured leases from surface claimants along a portion of its course and the object is solely one of drainage and transportation.

The Uinta tunnel pierces Battle mountain from Eclipse gulch a distance of 2300 feet, and was originally designed as a prospecting tunnel, but later became the property of the Woods Investment Co. and for the past year has been inactive.

The Columbine-Victor tunnel, 3600 feet long, cuts through Squaw mountain, intersecting the Gold Coin shaft at the first level on the Victor side and terminating near the site of the Economic Extraction Co's. mill on the opposite side, and will soon be utilized as an electric haulage route for ore between the mine and mill referred to.

The Squaw mountain tunnel was driven 1680 feet, and subsequently sold to the Gold Coin people and has been idle for three years.

The Standard, owned by some of the officers of the Standard Oil Co., was driven from the west side of Beacon hill a distance of 4000 feet toward Raven hill when a tremendous flow of water was encountered, which made an abandonment of the work necessary.

The American tunnel enters Beacon and Guyot below the Brodie mill and starts, it is asserted, at a lower point than any other tunnel in the district. Its course is toward the Elkton and Last Dollar and is to pass into the hands of O'Connor Bros., who own the Hibernia and Deadshot.

The Raven tunnel was driven solely for the purpose of enlarging operations of the Raven mine and as such served its purpose. It is about 3000 feet in length.

There are others on which more or less work has been done, but in none of which is there much activity to day. WASCOTT.

Cripple Creek, Colo., Oct. 10th, '99.

The Automobile.

Frequent illustrated references have been made to the freight and passenger carriages built in California and elsewhere, which, under the general name of "automobiles," are attracting considerable deserved attention. Some of the best mechanical intelligence is now being directed to the improvement and evolution of those "horseless carriages." In the East their manufacture is an increasing industry, and they are coming into common use. The motive powers are steam, gasoline, compressed air and electricity, the second named being of most general appliance. In its September issue, "The Automobile," a New York publication, devoted to the advancement of this particular industry, illustrates the present state of the art. The passenger vehicle here reproduced therefrom is a steam stanhope vehicle of neat and light appearance. The weight of this carriage

FIG. 1.—STEAM STANHOPE.

is about 400 pounds. The speed can be regulated by driver from one to thirty miles an hour. The mechanical equipment is very simple, and it is claimed that any one can operate it. Water and fuel can be carried for a long run, or obtained in any town or village. The vehicle can be run forward or backward at the will of the driver. The carriage is guided by a lever, which turns the forward wheels. It is fitted with pneumatic tires, ball-bearing axles, springs, etc.

Steam and electricity are largely used in passenger automobiles. For freight service gasoline is in more general requisition. The latest and best application of a gasoline motor on the Pacific coast was noted and illustrated in the issue of Feb. 18th, '99. In the issue of March 4th, '99, appeared an illustrated technical account of an auto-truck, an experimental device, the motive power of which was compressed air.

Experiment still goes on, for, costly though such experiment be, it is manifest that with good roads will come great demand for machines that will carry freight and passengers over moderate grades regularly at less average cost than horse power.

Herewith is presented what is believed to be the latest development in this matter of experimenting. Instead of confining the propulsion to one form of energy, the design of the power equipment of the Fisher automobile truck involves a three-motor idea, a gasoline engine with a connected dynamo for generating an electric current, a storage battery and an electric motor for driving the truck. This amount of machinery results in great weight to the truck, which in this case amounts to more than four tons, of which amount the storage battery weighs about 1000 pounds. Certain advantages in this combination are claimed by those who have studied the problem.

It is independent of a power station. The storage battery provides energy for driving the truck four or five miles, the truck having a reserve force, should the generating part become deranged. The gasoline engine, with its dynamo, is supposed to keep the batteries charged, thus having on hand their full reserve strength. The dynamo, acting as a motor, can also be used to give the engine an initial start, and, when running, it can maintain a uniform speed irrespective of the motion of the truck.

Among the manifest objections are large first cost, heavy weight and complexity of machinery, though the advantages of a variable speed, a backward as well as a forward motion and the certain control of the truck are considered as offsets to such objections.

The engravings only partially show the mechanism of the truck. The cooling pipes are noticeable under the footboard and at the sides. A large surface is thus provided in order that the water for cooling the cylinder may not reach the temperature of the boiling point. The designers have noted the liability of these tubes becoming damaged in this exposed position and will provide for a more protected place.

This truck has a wheelbase of 10 feet, and wheelgage of 66 inches. The front wheel diameter is 34 inches and rear wheel diameter 46 inches. The tires are 4x$\frac{5}{8}$-inch. The dynamo weighs about 600 pounds, the battery 1000 pounds, and other parts in proportion, giving a total weight of about 8500 pounds. It is purely an experimental truck, and it is expected that much may have to be changed. It is here cited and illustrated as showing what is being done experimentally to evolve a really economical autotruck.

In the arrangement of the apparatus, the engine shaft lies lengthwise of the wagon, with the engine cylinders vertical. The dynamo is placed at the front end, and is shown in Fig. 3. The truck is said to handle well, being run through narrow alleys and turned on sharp turns and backed with equal facility. The steering arrangement is considered satisfactory and will be retained.

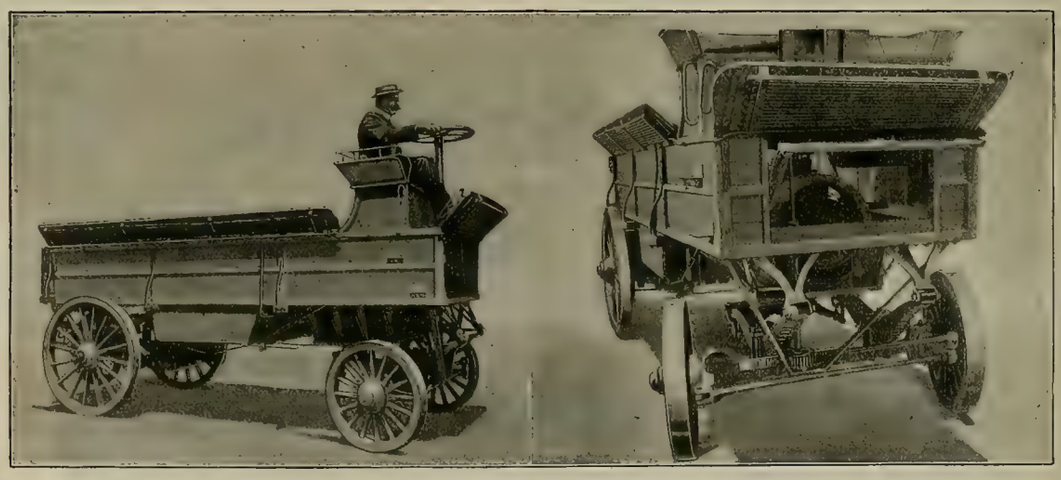


FIG. 2.—FISHER AUTOMOBILE TRUCK.

FIG. 3.—FISHER AUTOMOBILE TRUCK.

The makers say that the next truck built by them will be after a modified design of this truck. The engine is to be of a four-vertical-cylinder type, and about 12 H. P. It is to be located under the driver's seat, with the shaft placed across the body of truck. The wheels are to be made heavier, with heavier and broader tires. The speed will also be lowered, and will range from three to six miles per hour. It is hoped to reduce the total weight of truck relative to its carrying load. The weight of driving machinery requires greater strength in the truck itself, and, consequently, greater weight. It would seem that the whole problem lies in the driving equipment.

The truck in its present form is capable of carrying a load of 10,000 pounds over a good road at a speed of from four to eight miles per hour.

AT Butte City, Montana, the movement of a granitic mass along the line of what appears to be a fault plane has occasioned damage to numerous buildings along the fracture. Thus far the movement, though slight, has been sufficient to seriously crack the walls of these structures. That the movement is due to natural causes, and not to weakening by mine excavations, is determined by the fact that there are no extensive mines in the vicinity.

Mining Summary.

ALASKA.

(Special Correspondence). — This section, north end of Prince of Wales island, is beginning to attract attention. The Alaska Pacific M. Co. have erected and are now operating a 2-stamp (900-lb. stamps) mill and concentrator on the Bluebird group, and apparently have a large body of ore. The vein or veins exist along a faulted plane in granite, the axis of fracture being filled with quartz carrying auriferous sulphides, the granite itself having been to a great extent replaced by gold-bearing sulphides and vein matter. Apparently, a section of 50 or 60 feet in width is of sufficient value to pay. Negotiations are pending for the sale of the Wano group, on which a large surface showing has been fairly well developed to a depth of 150 feet.

Shakan, Alaska, Oct. 3rd, '99.

Seattle *Times*: Capt. Carroll, master of the steamer Queen, has made a trip to Nome, and says it is his impression that the wide expanse of tundra, or marshy moss-covered plain, extending from the beach back to the mines on Anvil, Snow Gulch and other creeks, are rich in gold-bearing gravel. Out of this flat a claim had been located and two men paid $6000 for it. They put up a rocker at a pool, stripped the moss and began making a cut, carrying the sandy material in wheelbarrows to the rocker. They had not gone 20 feet into the bank when they struck a bed of the ruby sand 18 inches in thickness, and it was as rich as the beach sands. Captain Carrol examined this mine and measured the stratum of sand. He says the cut or trench was 4 feet deep. The plain, which is a level stretch, extends back from the beach five to seven miles and runs along the coast. It begins 30 to 100 feet back from the present line of high tide and rises 12 to 15 feet above the beach. On account of its depth the beach miners did not take time to prospect it this summer, being too busy washing gold from the narrow strip of beach. Captain Carroll was at Nome several days and counted 1520 tents on the beach within a short distance of the town.

ARIZONA.

GILA COUNTY.

Globe *Times*: At the United Globe mines and smelter the company has put in a new 75 H. P. boiler at the Hoosier mine. A large pump will be put in the mine and as soon as the water is out sinking will commence. At the smelter a new furnace will be put in, the largest ever brought to Globe.

MOJAVE COUNTY.

The Oro Plata and the Mariposa mines have been transferred to Rocheford & Smith for $100,000.

Kingman *Mineral Wealth*: It is reported that the Kinsman M. Co. has struck an 8-inch streak of 500-ounce silver ore in the Echo mine in Cedar district. The Echo mine in early days produced ore that paid to be hauled to the river, sixty miles, thence to Yuma by boat, and from there to San Francisco by rail. The mine has been idle for years owing to the water in the workings. Of late years, however, the water has diminished until there is not enough to run the mill the company has erected.

YAVAPAI COUNTY.

The Morning Glory mill on Turkey creek was burned recently. The property is in litigation and the mill has been idle for some time.

Prescott *Courier*: New machinery for the Silver King mine on Groom creek has arrived. It consists of a large hoist and pumping plant. The Silver King is under control of Mr. Mackin and others. It figured several years ago in litigation and since has been idle, the shafts and workings filling with water. When the new machinery is erected Mr. Mackin will place men at work and handle the output at the Silver Flake mill, two miles from the mine.

Prescott *Courier*: The Tip Top mine, owned by E. and F. Wager, is being worked by the owners, who have taken out ore which carries 2000 ounces of silver per ton. R. Friedall is overhauling the Silver Museum mine, which is near the Tip Top, and is working on the top of a rich shoot of ore which carries 800 ounces of silver to the ton.

YUMA COUNTY.

It is reported that since Hubbard Bowers bought the Harqua Hala mines, his superintendent, C. Pickenbach, has opened new ore bodies and has enough in sight to run the mill two years.

Yuma *Sun*: C. Rader and V. Westfall will begin developement on a group of gold and copper claims twelve miles south of Tacna in the Copper Mountain district. They have ledges that assay well on the surface.——The coming winter will be a busy season along the Colorado river in northern Yuma county. R. J. Dyas, who recently acquired a group of fifty-six copper claims near Bill Williams' Fork, is working thirty men developing his property. The result so far has been satisfactory and he is considering the erection of a reduction plant. E. S. Blaisdel, in Empire Flat, also has a large force of men at work.

CALIFORNIA.

Amador.

Jackson *Ledger*: S. K. Thornton of the Shenandoah G. M. & M. Co. has a force at work developing the property of the company near Plymouth. The shaft is down 250 feet and the ore body fills the shaft at the bottom. Sinking continues and drifting in the ore body is being pushed at the 200-foot level.——Men at the Gover mine are pulling down the old buildings and getting ready to reopen the shaft as soon as the management of the Consolidated Gover, North Gover, Fremont and Loyal Lead mines is ready to enter upon that work. Arrangements have been made to commence the sinking of the three-compartment shaft on the Fremont, and the sinking of a shaft on the Loyal Lead and North Gover will be inaugurated. C. E. Purington has charge of the work.

Jackson *Republican*: Grading for the new 60 stamp mill at the Oneida mine is about finished.——It is reported the Butte Basin M. Co. will resume work with W. E. Stewart as Supt.——The Central Eureka mine will haul ore to the Zeila mill at Jackson for treatment. ——The shaft at the Bellwether mine at Jackson has been unwatered and preparations for sinking made. It is reported the owners intend to sink until a depth of 1000 feet has been reached.——The machinery of the Anita mine, near Jackson, has been sold to a company operating near Plymouth.

Sutter Creek *Record*: At the Mutual mine, on the Fernando ranch, the shaft is down 110 feet, and carpenters are erecting the framework around the shaft. A donkey engine for temporary use is being put in. The hoisting and pumping machinery will be completed in a few weeks.

Calaveras.

A. Lee has commenced the construction of the 120-stamp mill at the Melones Con. mines near Robinson's Ferry.

Two miners at Lancha Plana, while working placer ground on the site of the old schoolhouse, recently found an old can containing $985 in gold coin.

The copper mines at Copperopolis are being pumped out preparatory to starting up.

The work of unwatering the Sheep Ranch mine is progressing, and by the first of the year the mill now in course of construction will be in operation.

Recently a dam of the Ross Reservoir Co. broke and the Utica M. Co. was thereby deprived of one of its principal storage reservoirs. Half of that large body of water escaped down the San Antonio creek before the flow was checked. The Lightner mine was compelled to shut down. The mine was run by electric power. After the break in the Utica dam, water could not be spared for the batteries. Five years ago the same dam broke.

The What Cheer mine in Chili gulch, near Mokelumne Hill, is being reopened under the management of G. W. Enright, who has the mine under bond representing Denver, Colo., capitalists. The shaft is 200 feet in depth, at the bottom of which a level has been run 30 feet in the gravel and the pay streak is found to be 6 feet in width. There is a 5-stamp mill on the property and steam power is used for operating the hoist and other machinery.

The Commodore G. M. Co., of Stockton, has been incorporated: W. H. Clary, E. W. S. Woods, S. N. Cross, J. M. Abell, W. H. Clary, Jr., Stockton. Capital, $100,000. This company will operate the Commodore mine, a mile northwest of San Andreas. W. H. Clary, Jr., is Supt.

Angels *Record*: At the Melones mine, at Robinson's Ferry, workmen made a find and took $2700 from one place. They were working in the tunnel being driven at that place and cut a stringer, in which they found the gold.——The Santa Ana mine, in Albany Flat, four miles south of Angels, started up recently and will employ thirty-five men.——The Ford M. Co., at San Andreas, has levied a 4-cent assessment to meet the expenses of development.——J. N. Lively is making arrangements to resume work on the Veritas mine.

San Andreas *Citizen*: In the recent forest fires L. L. Emery of the Rose Hill mines lost 1400 feet of flumes, which will be replaced. Mr. Emery is enlarging the Jesus Maria ditch to carry 2000 inches of water and building a dam at Jesus Maria creek, to divert the water from it and the Little Mokelumne and carry it to the reservoir. The ditch from the reservoir to the hydraulic claim will carry 4000 inches of water.——Redmond, Casey & Haven are reopening the Mahala mine, near Rich gulch.

Del Norte.

Crescent City *Record*: The copper mine known as the Avoca, on the southerly slope of Myrtle Creek hill, was prospected thirty-five years ago and was abandoned at the time of the general decline of copper. A defined lead crops out 1500 feet, which is prospected by a shaft to a depth of 40 feet, showing a vein of ore 5 feet thick. At the base of the hill, 700 feet distant, is an old tunnel run toward the lead. The tunnel is closed by a cave 150 feet from its mouth, but it was originally in 600 feet. It is stated that good ore was taken out of the tunnel, some of it native copper. The Avoca is owned by E. C. Catching and is nine miles from Crescent City. On the hill a few hundred yards above the Avoca and parallel with it is a lead recently located by Mr. Catching and L. W. Musick. The surface ore assayed 22% copper and $5.50 gold per ton. No development has yet been made.

El Dorado.

The Little Gem is half a mile south of Volcanoville on the ridge between the branches of Grizzley canyon. This quartz discovery was made a year ago by Root & Schultz. It afterwards passed into the hands of San Francisco parties, with Judge Bahrs as Supt. Men are grading for the mill, which will have four stamps of 850 pounds each. The mill and hoist will be run by water power, the pipe for which is laid. There will be 200 feet pressure. The shaft is down 60 feet. The ledge is perpendicular and is 20 inches wide.

Georgetown *Gazette*: The 2-stamp mill recently erected at the Demetre mine, three miles east of Georgetown, is in operation. It is run by steam power.

Mountain Democrat: Supt. Bind of the Blue Gouge mine has contracted for a new 10-stamp mill with four Huntingtons. The capacity of the plant will be equal to forty stamps. It is calculated to have the mill running by December 1st.

Fresno.

The Ohio State M. Co. has sold its mining machinery to a Fresno foundry. The company put nearly $25,000 in the bed of the San Joaquin river at the mouth of Fine Gold creek in an unsuccessful attempt to dam the flow and recover the gold in the pool.

Kern.

C. R. Merriam has in San Emedio canyon two veins of iron ore, one 55 feet, the other 75 feet, wide, separated by a 30-foot vein of marble.

Mariposa.

A. H. Ward and Captain Todd are arranging to reopen the old Hite mine, at Hite's Cove on the south fork of the Merced river. A diamond drill will be employed in this work. The mine was successfully worked for twenty years by the discoverer, John R. Hite, and subsequently by three other parties who have left noting in sight. The hanging wall of the vein is black slate (Calaveras formation) and in it occurs several large veins and a gray felsitic dyke. No crosscutting has been done in the hanging wall and it is thought that a new shoot will be discovered there.

Mono.

Bridgeport *Chronicle-Union*: At the Castle Peak (old Dunderberg) mine, it is reported that the ledge in the new tunnel has been struck, opening up 9 feet of good ore. A sawmill is to be put up, and men are logging. Next spring and summer will find it one of the liveliest mines in the county.——The Arnot-Par Value mine has been turning out good ore and the mill has been running day and night preparatory to closing down for the winter. A number of extensions have been taken up by Supt. Gilnes, J. Hays and F. Page, the entire ledge being seemingly as good as the original locations—the Arnot and Par Value.——The Cameron mine is also coming to the front, a 5-stamp mill having been bought. These mines are in the Green Creek district, within a short distance of Bridgeport. The Castle Peak is owned by A. D. Cullum of London.

Nevada.

The Coe mine, half a mile from the Idaho, near Grass Valley, has been sold to Denver, Colo., capitalists. For a number of years in the early days this mine gave employment to many men. Ten stamps were run for ten years. Litigation between the original owners caused the mine to shut down, and subsequently the machinery was removed. At times the mine has been worked by tributors, the ore paying from $25 to $50 per ton. It has a three-compartment shaft 550 feet in depth. The product of the Coe mine has been $500,000.

Grass Valley *Union*: A discovery has been made in the North Star mine of a new shoot of ore in the 500 drift. The ledge is 3 feet in thickness, in virgin ground; the company has a large scope of country to work, owning all the ground between the North Star proper and Central North Star and Wolf creek. A test of the ore is now being made in the North Star mill, and, if it comes up to expectations, a larger plant will be put in.——The Board of Supervisors of Nevada county have appropriated $500 to the county association to be used in furthering the interests of the mining industry.

Orange.

It is reported that placer gold has been found in the Santa Ana mountains about twelve miles from Capistrano, and numerous prospectors are in that section locating and developing prospects. J. Yaeger, who for years has been prospecting in these mountains, has numerous claims. There are large masses of intrusive rocks among the metamorphic formations and prospecting heretofore in this region has discovered ores of silver and gold with the sulphides of iron, zinc, copper and galena. As far as developed zinc predominates, it is a good field for the prospector however, though the ores are base and will require concentration.

Plumas.

Quincy *Bulletin*: H. C. Dickinson of Reno, Nev., and J. H. Lesher, H. Gobert and C. Seward of Genesee have bought the Crown Point mine, east of Quincy, from G. Brandt. Part of the purchase price has been paid. They will erect a quartz mill.

Oroville *Mercury*: W. E. Duncan Sr. has his hydraulic elevator ready for working. Its duty is to handle the big boulders which are in placer mining the principal source of expense. By means of this elevator huge rocks and stumps are removed and the use of derricks dispensed with. The elevator consists of an inclined plane or grizzly 40 feet long and 10 feet wide. A 6-inch stream of water under a 325-foot head forces the material up the incline, the finer material falling through and the coarser being driven over the dump. The fine material runs back down a solid plane under the grizzly and is washed in sluice boxes, set at an angle from the bottom of the elevator. A monitor is used to wash the material into the sump. Mr. Duncan uses another elevator at the point where the material leaves the sluice, thus dumping the debris far from his seat of operations.

San Bernardino.

The hills comprising the Calico range consist of rhyolite, breccia and tufa, intersected by large dykes of hornblende, andesite and liporite. In the breccias chiefly the silver-bearing veins and great silver ore deposits of the district occur. These rocks lie upon an upturned older crystalline formation, gneissoid in character, with small granite veins traversing it. In this older formation are veins of quartz, rich in gold but as yet undeveloped. Gold prospects also are found near Paradise Springs, fifteen miles north of Calico, and northeast of the old silver camp fifteen miles is a group of claims on which a large amount of work has been done. They are known as the Alvord mines. An interesting feature is that the gold occurs in crystallized lime rock and in limonite ore. The wall rocks of the gold-bearing zone are much altered, but presumed to be a type of diorite.

San Diego.

Los Angeles *Times*: The treatment of tailings from the Cedros Island ore at National City by the Stephens process is by means of a solution which consists of chloride of lime, nitric and muriatic acid, bromide of potash, salt and water. From tailings containing $8.23 per ton it is claimed 97½% is recovered at a cost of 24 cents per ton, and out of 7000 tons of tailings on the dump 2000 tons will go $10. The Cedros Island ores are unlike most California ores and contain, besides silica, pyrite, chalcopyrite, malachite, iron oxides, arsenic, free sulphur, gold, silver, lead and other minerals. The ores are base and complex.

Shasta.

(Special Correspondence). — Near Delta H. C. Woodrow & Co. of St. Louis, Mo., are developing a property on which they have a shaft 110 feet deep and a 375-foot tunnel on a 9-foot ore body. They employ three shifts.

In the Advance mine, near Delta, a San Francisco company have cut an ore body of high grade. They have introduced cyaniding and get 94% of the values.

M. Vreem has been shipping ore all summer to the Keswick smelter. This property was worked by lessees and abandoned; the owner and present operator resumed work, and in 20 feet struck a rich ore body, from which the present shipments are made.

At the Black Diamond copper property, near Stillwater, owned by the North California Investment Co., of which C. Dobbelstein is Supt., sixty men are at work.

At the DeLamar copper property, at Ydalpom, about twenty-five men are employed. As the buildings advance to completion to house the employes, the force will be increased.

In the Bowery Belle mine, near Shasta, ore is being shipped from an 8-foot ledge. The product is white quartz, in which gold is visible frequently. The property belongs to Kahny & Burgbacher of Redding.

Redding, Oct. 17th, '99.

R. B. Johnson of Seattle has transferred to A. P. Wass of Butte, Montana, and T. Donnelly of Shasta county, the Sulphur Creek placer claim, the Thompson placer mine, fourteen and one-half acres of mining land and a water ditch, all in Quartz Hill mining district.

The Coronado Copper M. Co., which owns the Coronado mine in Sunny Hill district, has let a contract to Swanson, Strandin & Sjulauder for 350 feet of tunnel, at $5 per foot. J. A. Kahny is Supt. of the mine.

Redding *Free Press*: T. Maupin of Gas Point reports that two prospectors have uncovered two veins of gold quartz on Bee Gum, the North Fork of Cottonwood creek, said to be the richest in that part of the county. Several minor strikes have recently been made on Bee Gum.——J. A. Wilson of the Alta gold mine, near Furnaceville, says the ledge crops for 1000 feet along the claim, and averages 3 feet in width. At the point of discovery Mr. Wilson has gone down 8 feet and from his statement the gold runs $40 to $60 per pan. He is opening the ledge in the ravine 200 feet from the original workings, where the ledge is equally rich.

Redding *Searchlight*: The Bullychoop mine, also known as the Frick & Davis property, near Ono, has fifty men at work. It is owned by a German company. The mine is north of the Cleveland Consolidated. The latter has been bonded to a Scotch syndicate, and fifteen men are at work cleaning and putting the same in repair. A mill will be be built. ——At the Sunny Hill mine, ten miles east of Bullychoop and the same distance from Ono, the owners have twenty men at work, a chute 450 feet long having been put in below the mine.

Siskiyou.

The quartz ledge has been found again in the Golden Star or old Spencer mine at Humbug, beyond the break of a couple of weeks ago. The vein is 32 inches in width. When first opened it paid $120 to the ton.

Tyer & Co., of Colorado, have bonded the mine and mill of the California & Oregon quartz mine on Corson creek, Klamath river, above the Anderson ferry, and are now developing the mine. A shaft has been sunk 100 feet, and a tunnel run 200 feet from the shaft. The 5-stamp mill on the claim will be utilized.

In the Salmon river section, at present water is very scarce, and several quartz as well as placer claims have been shut down.

The Commodore quartz mine at Barkhouse creek, Klammath river, has paid the past month between $8000 and $10,000.

Collins & Co. are building a wingdam in the Klamath river, near Oak Bar, and reported to be taking out good pay.

Two Oakland doctors are working a quartz ledge on Patterson creek in Scott valley, near the Sheba mine. They have ordered 60,000 feet of lumber.

Yreka *Journal*: The Siskiyou M. Co., working the Mabel mine in the ridge between Barkhouse on Klamath and Scott rivers, J. W. Martin Supt., has bought the Chamberlin & Timmons' quartz mill. The mill will be utilized in development work and prospecting, with a view of putting up a larger mill later, as the company has several quartz locations in the same vicinity on McKinney creek.——The shaft at the Nurse ranch, near Greenhorn, is down 85 feet. Supt. Page expects to reach bedrock soon, if water does not prevent. The water is increasing as the shaft is deepened, and may necessitate a steam pump.——Several new locations of quartz and copper ore have lately been made in the Preston Peak section, near the Oregon boundary, in Happy Camp district.——The King Solomon quartz ledge, at Salmon river, is reported as showing up paying ore. Heretofore it was considered low grade.

Tuolumne.

Supt. G. F. Dyer of the Draper gold mine, near Soulsbyville, reports a rich strike in the

bottom of the shaft at the depth of 350 feet. The compressor and drills recently bought are on the ground.

At Big Oak Flat new strikes are reported in the Mack and Longfellow mines. Some of the ore is very rich. The veins of this section commonly carry tellurium and gold, also pyrite, galena and blende, and rarely copper sulphide. There are numerous pocket claims about Big Oak Flat, and in some of them the slates in which the pockets have been found are also known to be gold-bearing. Nearly all of the dumps prospect well in free gold. This is the material which has been rejected as waste by the pocket miners. The only tools used in working these pocket mines are the usual mining tools and a hand mortar, pestle and pan. The slate zones containing gold will require milling machinery for their reduction. Thus far there is a scarcity of water in the district, but the ditch of the Merced Co., which passes along the hills above the flat, will remedy the difficulty. Big Oak Flat in the early days produced a large amount of placer gold and every bit of the original soil has been washed away, exposing a granite bedrock. This granite mass has an oblong form and is inclosed on all sides by slates and mica schists, excepting at the southeastern end, where a granitic dyke extends from the main mass in the direction of Groveland. The granite is fissured in a northerly and southerly direction by quartz veins, with many smaller veins running in various directions, often connecting with the larger veins. The rich mines now being developed on the northern side of the basin are in the granite at the surface, but pass into the slates in depth.

Sonora *Union-Democrat*: The Sunnyside mine is on the river hill of the Tuolumne, one mile south of the Marlow Diggings, a section in which but little development has been done. The claim is owned by Baker Bros. of Summersville and L. R. Ellis of Sonora. The croppings are 2 feet wide. At a depth of 40 feet the vein has widened to 4 feet of ribbon quartz. Assays average $14 per ton. The mine is to be developed by a crosscut tunnel, which will tap the vein in 125 feet and give 150 feet backs. The tunnel has been driven 30 feet.

Sonora *Independent*: The Greenhorn Gulch quartz mine, near the Tarantula, and one mile north from the Rawhide, has been bonded to Dr. G. F. Hunter and M. Page. The property has a shaft on the vein.——The Mt. Jefferson Co. at Groveland is making preparations for the 10-stamp mill.——The Mt. Zion, near Groveland, after a long idleness has resumed work.——The Green Spring mine, near O'Byrnes' ferry, is yielding rich rock. The property was relocated by the present owners last November and the rich ore struck in extending the tunnel in the old workings. The ledge is wide.——A 5-stamp mill is being built at the Free Lance mine, southeast of Sonora, near the Burger ranch. C. A. Meyer of San Francisco is the principal owner and P. R. Gardner superintendent.

COLORADO.

CLEAR CREEK COUNTY.

Maxwell & Hood, operating the west extension of the Griffith mine at Georgetown, have opened a solid body of high-grade ore. It is telluride and runs on picked assays over 200 ounces gold to the ton, carrying one-third of the value in silver. The streak is 8 inches wide. Other parts of the vein have been worked for the past two years by different parties, and regular shipments of 200 tons per month of $50 ore have been made. This is the first high-grade find in the vein.

The Harrisburg mine at Freeland is being worked by a Boston company, with a fine showing of ore in the shaft and levels. They are sinking the shaft to greater depth to prove that the split vein now worked by the Freeland people is the Harrisburg. If this proves correct, it means considerable litigation.

The Everglade and White Talc claims at Yankee hill have been sold for $10,000 to New York parties.

P. Gilene & Co., leasers on the Independence mine, in the East Argentine mining district, have had a millrun made on their ore. The first car returned 473 ounces silver per ton, the second class 137 ounces per ton. The streak of pay ore is 3 feet in width.

GUNNISON COUNTY.

The Granite Mountain Co. is operating properties at Tomichi, in White Pine district. Dr. D. P. Campbell of Cleveland, Ohio, is Gen'l Mgr. The Granite Mountain, formerly the Magna Charta tunnel, has been driven nearly 4000 feet and has cut 27 veins varying in width from 18 inches to 12 feet. Drifting has been pushed on some of the veins to the extent of 590 feet and on others from 50 feet to 200 feet. The mine is equipped with a compressor and seven Ingersoll-Sargent drills, Pelton wheel of 100 H. P., an 80 H. P. boiler, 50 H. P. electric plant, two dynamos and a large amount of other machinery.

Gunnison *News*: The Taylor Park M. Co., working both lodes and placers in this county, is installing a $15,000 plant of machinery, consisting of three air drills and an 85 H. P. engine. An ore body 2½ feet wide, which averages $100 to the ton, has been encountered in a winze sunk from the upper tunnel level, 325 feet. There is a plan to drive another tunnel 500 feet down the hill from the second tunnel. H. A. Watson of Colorado Springs is Gen. Mgr.

Crested Butte *Pilot*: After fifteen years of inoperation, due to litigation, the Ruby Chief group of mines, near Irwin, has been bonded and leased to a company of Illinois and Iowa capitalists, the lease being dated June 1st, 1900, through the efforts of S. C. Robinson of Cripple Creek.

LAKE COUNTY.

(Special Correspondence).—The shipment, from the R. A. M. amount to 100 tons per day consisting of iron sulphides, whose values are chiefly silver.

The Ibex, the big group on Breese hill, is making extensive improvements of a mechanical nature, thereby increasing the compressor, pumping and engine power. At present about fifty-five air drills are operated. Mgr. S. W. Mudd states that the property is shipping about 200 tons of ore per day. The Ibex mines are about 1000 feet higher elevation than those on Carbonate hill, and the ores are generally silicious in character, whose values, in the order of their importance, are gold, silver and copper. The formation here is considerably faulted and disturbed, and the operations, which extend over a large area, encounter various conditions.

In Big Evans gulch, north of Breese hill, the ores from the Dolly B., Resurrection and others possess much the same silicious characteristics as those of the Ibex, though in addition there are low values in lead.

The mines, generally, of Carbonate and Iron hills are pushing their new work into the sulphide stratum, though the carbonate contact above it still produces considerable of the characteristic carbonate ores for which the district was originally noted.

The Sedalia, adjoining the Resurrection, belonging to O. C. Bartholomew of Leadville and W. H. Picking of Bucyrus, Ohio, recently resumed operations. The shaft is 710 feet deep and from a drift at that level a winze has just been sunk 15 to 20 feet in solid ore, which runs high in lead carbonates, gold and silver. This property is on Little Ellen hill.

Supt. Carnahan states that the Resurrection is shipping approximately 6000 tons per month. The ores, which come from the 800-foot level, are oxidized, somewhat siliceous, carrying gold and silver, with about 12% of lead carbonates. A new shaft is being sunk at a point 1700 feet from the old shaft. It will be sunk to 900 or 1000 feet, and in time will be connected with the old workings. This property is near the head of Big Evans gulch.

The New Monarch, in the same locality, is being opened and is shipping twenty-five tons per day.

The successful operations of the Home M. Co. of Leadville are attracting wide attention. The officers of this company are: J. Harvey, Pres.; A. Sherwin, Vice-Pres.; A. V. Bohn, Sec. and Gen. Mgr.; E. Stevens, Treas. The controlling stockholders are Leadville men. The company owns no mines, its functions thus far being those of a lessee. As such, it controls the grounds of the Estrella M. Co., of twenty-six acres; the Bon Air, Star, Penrose, the Gray Eagle group and the properties of the Pocabontas Con. M. Co. The Penrose belongs to McDonald & Bulkley and comprises about nine acres; the Gray Eagle and Pocahontas groups belong to Smith & Moffatt of Denver. The Home M. Co. likewise controls 400 feet of the southwest end of the Orion claim, as well as the Alice placers, within the city limits. The properties thus controlled under long-time lease form a part of the down-town group of mines. Their operations at present are confined to three shafts, viz: the Penrose, Star and Bon Air, from which shipments amount to about 150 tons of ore per day, which rate Gen. Mgr. Bohn anticipates will be kept up.

The Pumping Association, through whose operations the down-town mines were unwatered, nominally maintains its existence, though each mining company interested does a certain amount of pumping, and at the end of each month the expense is adjusted on a certain basis, the Home M. Co., perhaps, handling two-thirds of the water.

The Mab mine is shipping about 5000 tons of ore per month from its 1000-foot shaft. The ores are all sulphide, carrying gold, silver and lead.

The Adams, Maid & Wolftone Co., lessees of the old Adams, Maid of Erin and Wolftone grounds, on Carbonate hill, are sinking a new shaft 4½x15 feet in the clear, which is now 750 feet and will be sunk to 1500 feet. They are preparing to put in heavy hoisting and pumping machinery at this shaft which will cost at least $150,000. From the various leases on the group about 3000 tons per month are being shipped, which includes carbonates, sulphides and zinc ores. The new shaft is on the Wolftone grounds. S. D. Nicholson is manager of both the Mab M. Co. and the A. M. & W. Co.

The Coronado, operated by the Coronado L. & M. Co., in which Admiral Dewey and Gen. E. S. Otis are said to be stockholders, is shipping ore from the 540-foot level, same being carbonates, rich in silver and lead. A new station is being put in at the 600 level, where a compound duplex pump is to be installed that will handle 500 gallons of water per minute. Preparations are being made for sinking 200 feet deeper into the sulphide stratum. A. Tracy is Supt. and H. J. Higgins Mgr.

On the Midas a new shaft has reached the 535-foot level, from which a drift is being made to connect with the Penrose shaft, the latter being expected to handle the water from the Midas.

The properties of the Morning Star Con. and the Evening Star M. Co., under the management of E. D. Dickerman, are being opened through fourteen different shafts in Carbonate hill. About 150 tons per day are being mined, part of which goes to the Colorado Fuel & Iron Co.'s steel works at Pueblo, and the remainder to the smelters, the greater portion of the whole being iron ores, though there are some carbonates of lead which come from near the surface. All the present shipments are from the upper contact.

The Greenback shaft, on Iron hill, has reached 1100 feet depth and is equipped with heavy hoisting machinery. A new shafthouse is to be erected. At present from twelve to fifteen wagon loads per day are taken to the smelter.

The R. A. M. management are driving a drift on the 1500-foot level to cut under the ore body, the principal shipments being from the 1400-foot level. The surplus water is pumped to the 500-foot station, from which it is carried out through the Emmett workings.

The Louisville, on Iron hill, ships sixty tons of ore per day—sulphide of iron and lead. A. L. Winch is Mgr. and C. W. Bean Supt.

The Ruby, in the same locality, under lease to J. Maxwell and associates, was originally a carbonate mine, but present work is for the purpose of opening the sulphide vein at 500 feet depth. A crosscut is being run at this level. A. G. Goodwill is in charge of the mine.

The A. Y. and Minnie, on California gulch, is working under lease to Douglas & Newton, who also operate the concentration mill. They mine 100 tons per day, the product being lead concentrate.

The Moyer mine, belonging to the Iron-Silver M. Co., employs 120 men. Mgr. T. E. Schwarz states that the mill, being remodeled, will be ready to operate by Nov. 1st. Fourteen new concentrators are being put in place in this mill.

The Yak tunnel, the property of the Yak M. M. & T. Co., which starts in California gulch, below the A. Y. and Minnie, has been driven a mile and a half toward the Ibex grounds, on Breese hill. This company controls the grounds along its line by ownership and lease, being a prospecting as well as a drainage and transportation proposition. The tunnel is 7x7 feet, having a grade of 5 inches to the 100 feet. At present the face is in gray porphyry. It will cut the Ibex grounds at 1300 feet depth.

The Denver & Rio Grande and the Colorado & Southern railways are showing activity in extending spurs to various parts of the district. A branch of the Southern comes in by the Maid of Erin grounds, through Stravhorse gulch, across Carbonate hill to the Yankee Doodle, thence to the Henriett. The Rio Grande, which has had its Breese hill and Evans gulch branch in operation nearly a year, is also extending spurs to other parts of Breese hill and to Iron and Carbonate hills.

The Union smelting plant, which was idle for years, started up a few days ago under the management of the American Smelting & Refining Co.

It is estimated that the present ore output of Leadville mines amounts to over 2000 tons per day. WASCOTT.

Leadville, Oct. 14th, '99.

(Special Correspondence). — The *Herald-Democrat* gives G. W. Cook as authority for the statement that Leadville district has produced about 2,000,000 tons of manganese iron ore, and that the September shipments of this kind of ore amounted to 20,500 tons. Col. Cook is president of the Keno Mining & Leasing Co., a producer of manganese, whose output is shipped regularly to the Illinois Steel Works. On the 16th inst. twenty-five cars of this material were shipped from Leadville over the D. & R. G. Railway and fifteen cars over the Colorado & Southern to Denver, whence a train of forty cars was shipped to Chicago to the steel works above named, the aggregate being 1200 tons. The train was decorated with banners, bearing statements and figures showing Leadville's production of manganese, and others advocating a duty of $1 per ton on foreign imports of this material.

Leadville, Oct. 16th, '99. WASCOTT.

The South Park road having reached the Catalpa-Crescent, the lessees propose to ship 200 tons per day from that property.

Leadville *Carbonate Chronicle*: The ore congestion in the Leadville district is now at an end. There are three smelters in blast and the fourth, with an additional capacity of 300 tons per day, will be in operation in a few weeks, when the Leadville smelters will handle 2000 tons of ore per day.——The Fanny Rawlings M. Co. propose to sink the shaft to a depth of 1000 feet. A part of the new machinery is already on the ground.——The N. & M. fraction is improving, recent assays showing 42 ounces silver, .21 of an ounce in gold and 4% copper.

MINERAL COUNTY.

Creede *Candle*: For the current week the ore shipments from Creede were 158 cars—3470 tons.——Anderson & Martin have shipped a car of lead and zinc obtained from the creek below the Ridge mine.——W. Skinner has a contract to clean out the shaft of the Phœnix mine, in Phœnix Park, which has been leased to W. Boyle.——The retimbering of the old shaft on the United mines is completed to the water and the pumps and pipe line are being put in.——The Creede Co-operative is shipping forty to forty-five tons per day, the ore principally coming from the seventh level, where the vein is 4 feet wide and has been the same in quality and quantity since found. At this level the ore carries more gold than in any of the levels above. Most of the ore is being concentrated.——The diamond drill is boring toward the Last Chance shaft, which will be tapped at its bottom and drained by the latter part of next week, after which the drills will bore from the Last Chance into the Amethyst mine.

SAN JUAN COUNTY.

Silverton *Standard*: Syfer & Ray located a claim Sept. 28th near the Silver Wing mill, at the mouth of Picayune gulch. They have opened a good-sized vein of lead, running, assay tests, 100 ounces of silver. They expect to ship a carload of ore soon.——In the Red Mountain mining district the weekly shipments are: Congress, 8 carloads; Barstow, 2 carloads; Enterprise, 1 carload. —— The Treasury Tunnel, under Mgr. Hammond, has put in power drills, with 600 tons of coal housed for winter.——At Chattanooga the Elmira M. & M. Co., operating the Elmira property, formerly the Silver Ledge, are shipping one carload of concentrates daily.

SAN MIGUEL COUNTY.

Work has been suspended on the Meldrum tunnel near Telluride by orders of the head office at Glasgow, Scotland. The tunnel is in 2800 feet.

Telluride *Journal*: The Liberty Bell, in Cornet Creek basin, in the spring built a 10-stamp mill, by which it was demonstrated that it could successfully treat the product of the mine; ten stamps were added and later the capacity was doubled by the addition of twenty more, making forty. Recently the company began the erection of forty more stamps, which will give them a capacity of 300 tons every twenty-four hours. They have located the waters of Mill creek and will build a power plant at the lower end of the stream, below San Miguel, and generate power for their own plant. There is water to develop 300 H. P. for the greater part of the year in this stream. This power will be conducted to the mill and used for all purposes there, instead of the water power they now employ. A cyanide plant is to be built for treating the tailings from the 80-stamp mill, tests showing $1.50 per ton can be saved by this treatment, that now goes over in tailings.

Telluride *Examiner*: The new Smuggler-Union mill building at Pandora is enclosed and the work of putting in the batteries is under way. It will have sixty stamps of 1050 pounds each, ninety drops per minute, and it will be equipped with concentrating apparatus, made up of Frue and Triumph vanners and double-decker Wilfley tables, which will give an additional milling capacity of 200 tons every twenty-four hours.

Telluride *Examiner*: A large tonnage of ore from the Klondike property, in Ophir district, is being treated at the Suffolk mill. The owners, Van Endert and Roberts of Telluride, are conducting experiments and working the property with a small force. The ore averages $10 per ton, though a great deal of it has run $20.——The Liberty Bell management is experimenting with the cyanide process for the treatment of the tailings. If the experiment proves successful, the facilities will be increased to handle the entire tailings from the plant.

TELLER COUNTY.

(Special Correspondence). — It is learned from a reliable source that negotiations are pending, and likely to be consummated by Nov. 1st, '99, whereby there will be a consolidation of four corporations, viz: the Florence & Cripple Creek Railroad Co., Golden Circle Railroad Co., Midland Terminal Railroad Co., Metallic Extraction Co., La Bella Mill, Water & Power Co. and the Colorado Trading Co. The new company now formed to take over all the interests involved will be known as the Denver & Southwestern Railway Co., which will either build a new line of road from Cripple Creek to Denver or form connection with a new line that is to be built by another company. The deal, it is claimed, involves the purchase by the new company of all the interests of Messrs. Moffatt and Smith in the F. & C. C. Railroad, the Metallic Extraction Co.'s cyanide plant at Florence, Colo., and the power plant of the La Bella M. W. & Power Co. at Goldfield. The combination will control the transportation of the district and, to a large extent, the electric power, and will be a strong factor in the reduction of ores. It is claimed the promoters of the new company are the capitalists interested in the Midland Terminal Railway Co.

Fifty brick buildings are in course of construction at Victor; it is claimed most of this building is being done with Victor money and very little with borrowed capital. The town, which was destroyed by fire last August, will soon be rebuilt wholly with brick and mortar.

The La Bella M. W. & P. Co., at Goldfield, is preparing to put in an additional engine for generation of electric power. The steel smokestack of this plant is 200 feet high and 9 feet in diameter.

The problem of obviating the disastrous effects of lightning on the electric equipment of Cripple Creek district is receiving attention by electricians, and experiments are being made, the utility of which can be judged better later on.

The Portland M. Co. have been figuring of late on the projection of a drainage tunnel, and they may select a site near Marigold, several miles down the creek. At present they are handling a large volume of water with pumps, which is expensive and burdensome. WASCOTT.

Victor, Oct. 10th, '99.

(Special Correspondence). — The enormous increase of the ore tonnage of Cripple Creek district since September 1st has congested the smelter, mill and transportation channels to a serious extent. It has resulted in the shipment to the mills and smelters of train loads of ore, making a tonnage greater than the capacity of those plants, and as a consequence a great many railroad freight cars have remained tied up because they could not be unloaded promptly. It was reported on the 7th inst. that about 200 cars of ore were at the yards of one of the reduction plants which could not readily be unloaded and released. It will be seen that this caused some of the roads temporary embarrassment, making a shortage of cars. In the meantime published accounts of friction between the reduction plants and railroads, and between the miners and railroads, in which first one party and then the other is represented as making a "bluff" to effect certain results, are believed to have little foundation in fact. That some friction exists is evidently true, but it would seem to be the unavoidable consequence of the ore output of the district suddenly outgrowing existing facilities for treating it. But this condition will doubtless soon be overcome by the same kind of energy that enabled the mines to create it. WASCOTT.

Victor, Colo., Oct. 12th, '99.

(Special Correspondence).— Ore shipments from the Independence mine, at Victor, for September, amounted to 3023 tons, of the value of $252,000, or $86.88 per ton. It is claimed the ore shoots have widened, showing larger bodies of ore on the fourth level. In May the ore averaged 4¼ oz. gold; in June 3.85 oz.; in July 3.88 oz.; in August 3.95 oz. per ton.

Victor, Oct. 14, '99.

Denver *Republican*: The Nellie V. G. M

Co. has been incorporated. The Nellie V. claim and the War Eagle claim are involved, and $110,000 cash was the consideration. The capital stock is $1,500,000. The two claims owned by the new company are located on Squaw mountain, 700 feet north of the Gold Coin mine, at Victor. The Nellie V. has produced $85,000. The property has lain idle for three years.——It is reported that a strike has been made in the Roxanna Co.'s property, in Squaw gulch, near Victor. The find has been made in the shaft which is being sunk in the gulch. The company is controlled by the Smith-Moffatt syndicate. The shaft on this property is within 150 feet of the Dolly Varden.——Lessees operating the Electric, of the Cadillac Co., report that they have struck stringers from an ore body in the crosscut they are driving at a depth of 45 feet. This crosscut was driven through a basalt dyke, with the expectation that on the other side of it they would find ore. They are nearly through it, and the stringers coming in.

IDAHO.

LEMHI COUNTY.

Boise *Statesman*: A recent discovery in the Black Bird district is owned by J. P. Clough and J. Sims. They have a claim in the center of a copper deposit. The ledge is 300 feet wide and it has been located continuously for three miles. Clough & Sims have crosscut the ledge at shallow depth, finding it is 300 feet in width. The ore averages 6% copper and $3 a ton in gold. Eastern capital has invested extensively in this new district. The G. & C. Exploration Co. have secured bonds on five groups there, comprising over 100 claims.

SHOSHONE COUNTY.

Spokesman-Review: Since the beginning of the year twenty-six mining companies have been incorporated in the Cœur d'Alenes. Of these nineteen are at work; two, recently incorporated, have not yet commenced operations, and of the other five nothing is known beyond what is shown by county records. Eleven of them were organized prior to April 29, but the riot on that day put such a damper on the formation of new companies that, except two, which were then in the process of formation, no more were incorporated until July 3. Since then they have come regularly, September being credited with six, while the first nine days of October added three to the list. In nearly every instance enough treasury stock has been taken by local parties to furnish a working capital sufficient for present needs. The promoters' stock is pooled and consequently there is little of it on the market. There are more men at work in the Cœur d'Alenes to-day than there ever were in the days when the miners' union controlled the camp—probably 200 to 300 more than when the attempt was made to stop operations at the Bunker Hill last April.

Mullan *Mirror*: Mgr. J. S. Olin of the Hunter states that work on a 200-ton concentrator at the Hunter is to be commenced within thirty days. Lumber for the new flume has been ordered. There are 1500 tons of ore on the dump at the mine and development work is going forward. The tunnel is in 1800 feet, and from tunnel No. 5 a shaft is down 160 feet. From the bottom of this shaft to the surface at the upper workings is 900 feet.

KENTUCKY.

The Queen City Mining & Manufacturing Co. has been organized in Cincinnati, which will mine zinc within 100 miles of Cincinnati. The subscribed capital is $25,000.

MICHIGAN.

HOUGHTON COUNTY.

A proposition is being agitated that contemplates a large mill, built at a central point in the copper country, to do custom stamp milling business for the benefit of the large number of new mines now being opened. New mines could become producers in a small way as soon as the work of opening them was begun, and would thus be put in a position to partially pay for their own development, and the percentage of mineral in their rock could be determined early in their career.

During September the Quincy copper mine produced 1,588,000 pounds of copper.

MISSOURI.

JASPER COUNTY.

D. H. Moffat and associates of Denver, Colo., have been investing in Joplin zinc fields. Mr. Moffat a short time ago bought the lease of one mine, paying $15,000 bonus.

MONTANA.

GRANITE COUNTY.

Philipsburg *Mail*: J. T. Pardee has sold to P. A. Fusz, Pres. of the Granite-Bimetallic Con. M. Co., his placer ground in Basin gulch, consisting of thirty-four acres, the consideration being $20,000. During the past four years thousands of dollars' worth of gold dust has been extracted by a few men during thirty days in each year. Mr. Fusz last April bought the placer mines owned by Allen & Spees, and later bought the claim adjoining on the north, owned by S. Watson, for $6000; also the adjoining ground on the south, owned by Con brothers.

SILVER BOW COUNTY.

J. A. and M. H. Murray have transferred to the Anaconda Copper M. Co. their interest in the Findling lode claim north of the city limits of Butte. Consideration was $25,000, and surface area conveyed was two acres.

NEVADA.

STOREY COUNTY.

An important industry promises to develop in the working of the so-called waste dumps of the more important Comstock mines. On the Confidence ground there is a large amount of quartz which contains gold and silver, and a mill erected at this point could also handle the Alpha dump to the north. It would take several years to reduce these dumps. The Yellow Jacket dump is also known to contain a great deal of low-grade ore. The Overman tunnel dump in Lower Gold Hill consists largely of quartz known to contain value. The large dumps of the Caledonia, Mides, Uncle Sam, Mary Ann, Trojan and Seg. Belcher and old Overman contain sufficient value, it is thought, to pay well with the new cheap power. Besides these there are numerous other dumps containing sufficient gold and silver to make their treatment profitable by the improved methods of to-day with the electric power.

The pumping operations on the Comstock have succeeded in lowering the water materially within the past week. Following is the latest official telegram:

VIRGINIA, Nev., Oct. 19th, '99.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco: At 6:30 this morning the water was 111 feet 2 inches below the 1050-foot level station. No. 2 elevator has been running continuously. JOS. R. RYAN.

WHITE PINE COUNTY.

There is a copper deposit six miles west of Ely, on which nine claims have been located. The deepest shaft is 70 feet, in solid copper ore, several other shafts and holes showing the same results. There are no veins or ledges, but a solid body of copper ore covering acres of ground. The values are said to run from 12% to 30%.

NEW MEXICO.

GRANT COUNTY.

The Hanover Copper Co., with a capitalization of $1,000,000, has filed articles of incorporation at Santa Fe, to operate mines in this county.

OTERO COUNTY.

A corporation has been organized to work the dry placers of the Jarillas. Dry washers have been bought for the purpose.

SIERRA COUNTY.

The Sierra county placers during September produced $3000 in gold.

OREGON.

BAKER COUNTY.

Seattle *Mining Record*: A rich strike was made recently in the Pocahontas Belle, near Baker City. The pay streak is 18 inches wide, with free gold in pyrite. The property is owned by C. Buzzard and T. Rinehart, formerly of Cripple Creek, Colo., who have refused an offer of $80,000 for the claim.——The Spokane capitalists who recently purchased the Copper Queen, on Powder river, made the first payment of $30,000 last week. A smelter will be built.

Sumpter *American*: The Cougar mining property, near Granite, is getting ready for extensive operations. All of the machinery is on the ground. Mgr. Larkin has, it is said, 7000 tons of ore on the dump. They expect to run only 70 tons a day for the first two or three months, and later to put on 100 men and treat 200 tons of ore daily.——The Thornburg placers, on the North Fork of the John Day river, nine miles west of Granite, have been bonded to Denney Bros., of Denver. Elmer Thornburg will continue to direct the operations under the general management of W. S. Duncan. It is stated that the property has been bonded on a basis of $23,000 and $3500 paid. The new company has put in two derricks for handling boulders and are driving a tunnel through the rim rock and will make an upraise to sluice out a large area of pay dirt which has heretofore not been touched.——Thirty men are working at the Magnolia mine, near Granite, grading for the new mill and framing timbers. The work is in charge of Millwright McLane, who built the Bonanza mill. Last week the workmen on the grade uncovered a 20-foot ledge, which panned free gold. W. L. Vinson bought this property a year ago for $45,000. He made the second payment of $5000 on his Magnolia bond, on the 6th in Baker City.

JACKSON COUNTY.

Ashland *Record*: In the vicinity of Hornbrook, Roberts & Co. continue to employ sixty men. This mine has kept ten stamps running on high-grade ore for eighteen months, averaging twenty tons per day.——Laflesh & Miner have seventeen men at work in their mine and mill.——Rose & Nikirk commenced crushing ore October 2d, in their new mill on Ash creek.——Doney Bros. tapped a heavy flow of water in their mine and are compelled to suspend until a pump can be put in.——H. Mattern has bought from C. Harness a half interest in the Ohio mines for $2000.

SOUTH DAKOTA.

LAWRENCE COUNTY.

John Greenough has driven a 1400-foot tunnel on his Reserve claim on Green mountain and has developed a valuable shoot of ore in the lower quartzite, which lies at the base of the Cambrian. On the north slope of Green mountain this stratum of quartzite contains galena and carbonate ores carrying values in silver and gold. The eruptive rocks of the same locality also are gold-bearing in numerous places, as in the old Huxley and Empire mines.

At an expense of $35,000 the shaft in Ruby basin, which was started by the D. & D. Co. two years ago, has under the ownership of Con. Golden Reward Co. reached quartzite at a depth of 590 feet. Drifting has already started east and west from the bottom of the shaft. The encountering of ore at this point on the belt means a great deal, for if such ore shoots are opened as are exposed in the Tornado and Union mines the construction of large plants by the Golden Reward Co. in Deadwood is assured, as it will be demonstrated that the silicious ore bodies extend for 16,000 feet through this company's properties.

UTAH.

BEAVER COUNTY.

Mgr. Farnsworth of the properties of the Horn Silver at Frisco says that the most interesting features at present are those in the copper-bearing shoot, so long neglected and from which a large part of the company's earnings are now being derived. The shoot has opened 8 feet of ore that averages 25% copper.

IRON COUNTY.

Tribune: The owners of the Johnny mine received for the last shipment to Salt Lake $2260 per ton. The new whim is in place on the Johnny and hoisting will be increased.——The Ophir, at a depth of 225 feet, has struck a body of rich ore, which carries gold and silver, 5% copper and 2½% lead.

JUAB COUNTY.

The cleaning out and catching up of the ore body recently uncovered in the Blue Bird, at Diamond, discloses 5 feet of silver and lead ore. The intention is to install a set of jigs. The strike was made at a depth of 325 feet.

At the Shoebridge Bonanza, Tintic, the pumps are going, water is being raised and the jigging of ore that has been stacked upon the dump for many years has commenced. The management is sacking high-grade lead and silver ore below.

Mgr. McIntyre of the Mammoth reports concerning the strike of high-grade gold ore that they occur at irregular intervals, while the entire ore body carries gold value. Sinking of the shaft, now at a depth of 1800 feet, will be resumed.

The shaft on the Dragon Iron mine at Tintic is down 460 feet, and will be provided with a cage, to be operated by a small hoist designed for it. At the 400-foot level the management has ordered drifting to commence which will take them 350 feet below the quarry, from which a great volume of iron ore is being mined.

Another strike is reported in the Grand Central at Mammoth in new ground, in Silveropolis territory.

Salt Lake *Tribune*: At a conference between the management of the Centennial Eureka M. Co. and the representatives of the American M. & S. Co. in Salt Lake on the 15th inst. a contract was agreed upon in which the American Smelting Co. will receive from the Tintic mine 100,000 tons of ore of the "first class"—the gross valuation of the tonnage specified in the contract being $4,000,000. At the conference were Bert Holden, managing director of the mining company; C. E. Allen, local manager, and J. W. McNeill, local manager for the United States M. Co. Representing the smelting interest were T. R. Jones, district manager, and H. Lyne of Denver, the latter the general contracting agent for the American Smelting Co.

SAN JUAN COUNTY.

The Big Indian group, on the southern slope of the La Sal mountains, has for three months been in the hands of New York parties, who had an option on the property for $500,000, which expired a few days ago, and the owners have resumed possession of the property and are making preparations for development. The mine is one of the largest copper propositions in Utah, though but little development has been done on it. The plans of the company include the erection of a plant for the reduction of the ores, and a force of men will be employed all winter. The erection of the mill will be commenced in the spring.

Mercur *Mercury*: A. Caldwell, who has interests in the Lasalle copper district, has bonded a group of his claims to Eastern parties for $40,000. Mr. Loomis of Colorado Springs is running a tunnel on a group of claims adjacent, is in 1400 feet and has cut the main copper-bearing vein, which is 93 feet thick and consists of pay ore from wall to wall. He intends to put up a fifty-ton concentrating plant.

SALT LAKE COUNTY.

The Bingham tunnel is approaching the 2000-foot station, and is advancing at the rate of 11 feet a day.

In the Sunnyside group, at Bingham, a discovery has been made in the new tunnel, where the management has uncovered a body of silver-lead ore, the assays from which show 67.6% lead and thirty-six ounces silver, with a small amount in gold. The ore occurs in a vein 8 feet wide.

The development of the shoot of high-grade copper, gold and silver ore recently encountered in the tunnel of the Bingham Copper & Gold M. Co., has begun. It has been followed several feet beyond the line of the tunnel.

A shipment of pig copper from the Highland Boy mine to the eastern refineries, consisting of two carloads, 120,000 pounds, valued at $20,000 represented a trifle over half a week's run.

The Morning Star group of claims, joining the Highland Boy and Zelnora at Bingham, have been bought by J. S. Kennedy of Boston for $200,000. The transaction was promoted by M. R. Hunt, Gen. Mgr. for the Last Chance Co. of Bingham. The Morning Star lines are 300 feet from a point in the Highland Boy, in which the management are stoping ore, while experts state that within its lines are 1200 feet of the Highland Boy vein.

Salt Lake *Tribune*: One more new furnace added to the set at the Germania smelter was blown in Saturday, and T. R. Jones, district manager of the amalgamated plants, thinks it looks as if a further increase in the capacity of the smelters will be necessary. With the blowing in of this new furnace at the Germania, and with two at the Mingo, the two smelters will this month handle 21,000 tons.——Upon the return of O. P. Posey, general manager for the Bingham Copper & G. M. Co., at Bingham, from Boston, definite information concerning the proposed smelter will be announced.

Salt Lake *Tribune*: The valley plants operated by the American Smelting & Refining Co. have eight furnaces in blast, running at maximum capacity. Six are in operation at the Germania and two at the Mingo, the combined plants handling 9000 tons of ore per month, employing 600 men. While the ores of the Old Jordan and Galena, the Old Telegraph and Niagara, owned by the United States M. Co., have been withdrawn from the market, their places have been filled by new producers and the increased output of the old ones. In addition to the ore reduced at the custom smelters, 6000 tons a month are smelted in the Highland Boy (Utah) smelter.

SUMMIT COUNTY.

At the old Park mine in Silver City the raising of ore has recommenced and in a few days another shipper will have been added to the list. In early days the Park was productive of a great deal of high-grade ore which was hauled sixty miles before the railroad was reached and then treatment charges were high. The sulphides were then encountered and for many years the property was practically abandoned. About a year ago the ground changed hands and the exploration of lower levels begun under the management of C. E. Loose. A short time ago ore was found.

TOOELE COUNTY.

In Deep Creek district, S. Crismon, B. and O. Young and F. Little are driving on their group at Clifton, and at 160 feet have broken into a body of copper-lead ore carrying silver and gold.

L. Martin, representing J. F. Woodman, is at the Cane Springs mine putting it in condition for winter work. For over three years it milled gold-bearing ore.

A carload of ore has been shipped from the Wilson group at Wilson Springs that runs high in copper and lead.

The Clark concentrator, now building at Ophir by W. A. Clark on the properties of the Ophir Hill Con., purchased by him during the season for $75,000, will have a capacity of 100 tons of ore daily with the present volume of water. The construction is under the direction of E. W. Clark.

WASHINGTON.

FERRY COUNTY.

A strike has been made in the San Poil at Republic. The south drift has widened to 8 feet and an average assay of 5 feet of ore was $104.

The new camp at Bolster is the scene of numerous new finds and prospectors are going there. It is on Meyers creek at the foot of Buckhorn mountain.

SNOHOMISH COUNTY.

Everett *News*: The sale of the ten claims composing the Bonanza Queen group, near Silverton, by J. F. Bender, A. Sutherland, N. Lockwood and others to J. B. Gallagher and others of Butte, Mont., is announced. The consideration was $25,000 cash, $62,000 to be paid December 1, 1900, $62,500 to be paid April 1, 1901. J. B. Gallagher has been the representative of Marcus Daly for fifteen years and it is reported that the purchase is in his interest.

WISCONSIN.

DOUGLAS COUNTY.

It is reported that a company is being organized with a capital of $2,000,000 to develop the Cuilligan copper property, one of the oldest in the Copper range.

FOREIGN.

AUSTRALIA.

The Mount Lyell smelters from July 27th to August 23rd, inclusive, treated 21,314 tons of ore for an average of: Copper, 3.46%; silver, 3.10 ounces per ton; gold, .09 ounce per ton. In addition there was treated 2237 tons of purchased ore. At the converters there was produced during the same period 829 tons of blister copper, containing copper 820 tons, silver 64,520 ounces, gold 341 ounces.

Melbourne *Standard*: The returns for the Lake View Consols mine for July were: Stone crushed at battery, 6893 tons—4726 ozs.; tailings cyanided, 3380 tons—1370 ozs., 19 dwt; slimes from filter presses, 2837 tons—1119 ozs., 8 dwt.; treated by new sulphide plant, 356 tons—1027 ozs., 16 dwt.; sulphide ore treated in Eastern colonies, 760 tons—22,230 ozs., total, 30,473 ozs., 19 dwt.; total number of tons ore treated, 8009; total value of gold, £124,500.——The fifty-two tons of sulphide ore sent to the Broken Hill Proprietary Co.'s Works, Port Pirie, for smelting yielded 657 ozs. of gold, an average of 12 ozs., 13 dwt. per ton——The Sulphide Corporation reports for July. Central mine, Broken Hill, ore milled, 4222 tons; concentrates produced, 930 tons, containing 29.1 ozs. of silver per ton, 63.3% lead, and 10.6% zinc. Cockle Creek works, bullion produced, 360 tons, containing 18,017 ozs. of silver and 515 ozs. gold ——The Central mine at Broken Hill is down 670 feet in the Kintore shaft. At this depth clean sulphides, worth 13.6 ozs. silver, 18.8% lead, and 22% zinc, have been struck.

BRITISH COLUMBIA.

The Payne mine in the Slocan has been developed during the summer so that an output of 2000 tons of ore per month could be made. The Payne is worked through adits and produces galena and carbonate ores. In 1898 it shipped 14,000 tons of ore.

One of the richest strikes ever made in Moyie has been made in the No. 1 tunnel of the Lake Shore mine, where 12 feet of solid galena ore was struck. This tunnel was being driven to strike the same ore body which was encountered in the No. 2 tunnel, but it was not thought that a large quantity of ore would be found at such a short distance in from the surface—75 feet.

A rich strike has been made at the Ward mine, Cariboo, in which San Francisco capitalists are interested; $1000 a day is being taken out.

Spokesman-Review: The Number One and Josie will begin shipping fifty tons daily. The ore will go to Northport. The vertical shaft in Number One is down 400 feet and at the 200 and 300 levels an ore shoot 4 feet wide has been opened 300 feet long, and its farther extent is unknown. Drifting to the vein is

in progress at the 400 level.——At the Josie the main shaft is down 500 feet and is now being overhauled for the electric hoist.——Rossland has nine shipping mines, including the Number One and Josie. The others are the Le Roi, War Eagle, Center Star, I X L, Iron Mask, Evening Star and the Virginia. Their total output, including the daily shipments of 200 tons from the Le Roi dump, will make the output of the camp 1000 tons per day.——The Evening Star has closed down and employes dismissed. It is said that the close-down is the result of a disagreement among the stockholders. The Evening Star Co. is a Spokane corporation. It has exhausted its treasury stock and recent development has been paid for by shipment of ore.

Rossland *Miner*: A rich strike on the Oro Donero is reported.——The main vein on the Referendum on Forty-Mile creek after a four-year search has been found. A shaft had been sunk 50 feet and a crosscut run 103 feet, where the ledge was met and crosscut and found to be 2½ feet in width. The crosscut was run into the hill and the ledge was found 60 feet below the surface. The formation is schist and the vein cuts the formation at right angles. Another vein has been found on the Referendum, 22 inches wide, which is parallel with the ledge just found and is 100 feet from it. The property is to be opened to the 200-foot level. In the meanwhile the intention is to install a 5-stamp mill. There is ore enough in sight, Supt. Littlejohn says, to keep the mill in operation for some time.—— The returns from the Northport smelter of Le Roi ore shipped from the mine for the first half of last month show as follows: 4249 tons shipped, giving 1735 ounces of gold, 3827 ounces of silver and 51 tons of copper, the total estimated gross value being $51,000.

CANADA.

In the zinc region north of Rossport, on the north shore of Lake Superior, good locations have been made near the Zenith mine, which was purchased a year ago from McKeller Bros., of Port Arthur, by men who put miners to work on the property during January, February and March. The ore was sacked and hauled out with sleighs twelve miles to Winston siding on the C. P. R. From there it was shipped to Belgium for treatment and netted $22 per ton. The result of the three months' work showed a gross return of $73,000. Negotiations are under way for the sale of the property for $230,000. There is said to be a quarter of a million dollars of ore in sight from the work of last winter. The Zenith has an ore body varying from 6 feet to 30 feet wide, all zinc blende.

Toronto *Gazette*: The Sultana mine in the Lake of the Woods district has been sold to a company known as the Sultana Mine of Canada, Limited, with head offices in London, England. The capitalization is $1,340,000. The manager of the mine is W. M. Strong.

LOWER CALIFORNIA.

The San Fernando copper mine, below San Quintin, has been bought by Denver capitalists. The price is reported at $175,000. The purchasers are represented by E. C. Humphrey of Denver. The San Fernando group of mines was worked years ago by French capital. The deepest workings in the San Fernando are 470 feet, with copper ore running from 25% to 40%. Work begun two or three weeks ago has reduced the flooded lower levels to operating condition. It will be necessary to develop water, as the mine is in an arid district. A smelter is to be built at the mine, operated by oil fuel from Los Angeles.

L. A. Wright, Mgr. Republica gold mine in Lower California, states that the 10-stamp mill lately put up at the mine will be replaced by a 30-stamp mill. A cyanide plant will also be put in to work tailings. Col. Boynton and R. Surbridge, president and vice-president of the Republica Co., who recently visited the mine, have returned to New York.

MEXICO.

Nogales *Oasis*: J. A. Naugle, manager of the Sonora railway, and G. H. Robinson, general attorney for the same corporation, at Hermosillo, have bought of A. Graff and F. C. Hartmann, in the interest of the Southern Pacific Co., the coal properties in the Barranca region for $125,000, United States gold coin. ——C. Meeker of Lafayette, Indiana, has recently bought of Bentley & Rawson of Minas Prietas the Admiral Dewey mine, near Willard station, ten leagues from La Colorada, from P. & S. Penelli of La Colorada, and C. Bernard of Hermosillo, the Esmeralda mine, and from H. Prickett of Nogales, and associates, the Sevillana mine, making a group of mines including seventy-two pertenencias. The price stated is $75,000, gold, for the group. The Dewey is copper, the Sevillana is lead and silver, and the Esmeralda, which is an extension of the other two, has both ledges. On the Sevillana is a shaft 300 feet deep, also a 60-foot shaft. On the Esmeralda are old, abandoned Spanish workings. Mr. Meeker has ordered a gasoline hoist.

SOUTH AFRICA.

The Government has turned over the Ferriera mine to the directors on condition that work is to proceed. The stock exchange is closed.

TASMANIA.

The whole of the shaft of the South Lyell, 11x4 feet, is in sulphide ore without a particle of gangue in it, bulk assays going 4½% of copper and 3 dwt. of gold.——The North Lyell Consolidated No. 3 tunnel is composed of gray schist, heavy mineralized, with quartz leaders carrying a little copper.——Assays from the Glen Lyell have been made with the following result: From open cut: copper, 10.6%; silver, 10 dwt., 12 grs; gold, 15 dwt., 15 grs. No. 2 adit, copper pyrites: copper, 20.7%; silver, 1 dwt., 7 grs; gold, a trace. South crosscut; copper, 5.3%; silver, 12 grs; gold, 19 grs.

Industrial Notes.

—Another railroad is to be built between Sacramento and Stockton, Cal.

—In Mazatlan, Mex., there has not been a failure or a fire for fifteen years.

—There is no economy in paying low wages, for cheap pay secures cheap work.

—Deposits in the San Francisco, Cal., savings banks amount to $117,324,597.

—Durango, Mexico, wants to borrow $2,000,000, to be expended in local improvements.

—The assessed valuation of the State of Montana, exclusive of railroads, is $136,000,000.

—Los Angeles, Cal., will now sell its recently authorized water bonds to the amount of $2,090,000.

—Santa Barbara Co., Cal., is shipping large quantities of beans for coffee manufacture in San Francisco.

—The United States of Colombia want to borrow $14,599,500, with which to replace its paper currency with silver.

—Beef on the hoof sells at $7 a hundred at Chicago—the highest October price since 1884. British war orders indicate further advance.

—The Edward P. Allis Co. of Milwaukee, Wis., recently advanced the wages of their employes 5%, requiring a monthly addition to their payroll of $15,000.

—The Transvaal war will interrupt a profitable and growing trade in mining machinery sent from the United States, but which in any event will be renewed.

—The Canadian-U. S.-Alaskan boundary dispute has been temporarily arranged by a line drawn across Chilkat pass, delimitated by the river and mountain top.

—A dollar never saw the day when it would buy more food, clothing, transportation and other necessaries of life than now. And a dollar never saw the day when it could earn less than now.

—Contracts have been made with ten steamers to carry ore from the Lake Superior iron docks to Cleveland, Ohio, next season at $1.25 a ton against 60 cents this season. This means that iron ore will sell at fully $2 a ton advance over the prices of the present year.

—The first steel plate ever made in Colorado was rolled at the new plate mill at the Bessemer Steel Works, Pueblo, on the 11th inst. It is a 78-inch mill and the first day's product ran 72 inches. The capacity of the mill is 100 tons per twelve hours for ¾-inch plates and twenty-five tons for ten gauge plates.

—The Columbia & Western extension of the Canadian Pacific Railway is nearing the terminus at Midway. The average cost of the present system has been $30,000 per mile, or $3,000,000 for the entire road. For two miles along McRae creek, the roadbed is cut through for a height of 50 feet. The cost of that section was $200,000.

—From New York to Valparaiso, on the western coast of South America, via the Straits of Magellan, is 8460 miles; via Colon and Panama it is but 4572 miles; from New York to San Francisco via the Straits of Magellan is 13,090 miles; via Nicaragua it is 4867. The commerce of the west coast of South America now amounts to over $100,000,000 annually. Of this sum but $15,000,000 is with the United States. The imports of Chili, Peru, Ecuador and Bolivia amounted in 1897 to over $50,000,000; of this amount less than $5,000,000 was from the United States.

—H. S. Pritchett, Supt. United States Coast and Geodetic Survey, goes next season on the U. S. steamer Pathfinder to Alaskan waters to survey the islands of the Aleutian group, near Unimak pass. The islands, Mr. Pritchett says, have not been correctly located on Government charts and maps. Several islands of the Aleutian group, lying between fifteen and twenty miles apart, near Unimak pass, have been selected as a field for the use of wireless telegraphy. By this means Mr. Pritchett expects that the difference in latitude of the islands will be determined accurately.

—The following figures illustrate the changes which have occurred in the railway system of the United States in the last eighteen years:

	1880.	*1898.*
Miles of railway	93,262	186,810
Miles of track	115,647	245,239
Miles of steel rails	33,680	220,804
Miles of iron rails	81,967	24,435
Number of locomotives	17,949	36,746
Number of passenger cars	12,789	25,844
Number of freight cars	539,255	1,284,807

There are five and one-half times as many miles of steel rails as in 1880; the mileage of iron rails has decreased 70%, to a little over 24,000, and will soon disappear.

Commercial Paragraphs.

RICHARD A. PEREZ, assayer and analytical chemist, of Los Angeles, Cal., has moved to 120 North Main street, Los Angeles.

H. D. & H. W. MORRIS have removed from their former location, 223 First street, to room 194 Crocker building, San Francisco. They continue as sales agents for the Chrome Steel Works of Brooklyn, N. Y.

PARKE & LACY CO., 21 and 23 Fremont street, San Francisco, are sole agents for Ingersoll-Sergeant rock drills and air compressors, Knowles pumps and Pulsometer pumps, and Bullock diamond drills.

THE Western Chemical Co. of Denver, Colo., has built on a larger scale the works recently destroyed by fire, and will have a monthly capacity of 1,000,000 pounds of sulphuric acid. The Western Chemical Works reports a deservedly large trade, its chemically pure product now being shipped everywhere.

Personal.

LOUIS JANIN is in Salt Lake City, Utah.

THOS. EWING is at the Sheeptrail mines, in northern Arizona.

T. C. ARCHER is Supt. for the Mountain Copper Co. at Keswick, Cal.

W. H. LLEWEWELYN, a New York mine operator, is in San Francisco.

BENJ. CRAWFORD is Mgr. "Morenci, Arizona, Copper Mines, Ltd."

W. L. WATTS has returned from Los Angeles, Cal., to San Francisco.

W. S. KEYES has returned to San Francisco from Montana, Utah and Nevada.

WM. MCDERMOTT has returned from San Francisco to Salt Lake City, Utah.

D. B. HUNTLEY of De Lamar, Idaho, is temporarily sojourning in San Francisco.

W. B. WILSON, formerly of Colorado, is the Supt. of the Le Roi mine, Rossland, B. C.

RALPH D. WANN has organized and is in charge of the El Paso Assay Co. at Victor, Colo.

A. L. COLLINS succeeds C. W. Miller as Gen. Mgr. Smuggler-Union mine, Telluride, Colo.

T. A. RICKARD of Denver has gone to London, Eng. He will return to Colorado about Nov. 20.

CURTISS H. LINDLEY of San Francisco has gone to the Cœur d'Alenes, Idaho, on professional business.

ALEX. BURRELL, Mgr. of the Drum Lummon mine at Marysville, Mont., has returned from Leadville, Colo.

GEO. T. RIVES, Gen. Mgr. Golden Cache Con. M. Co., has returned to Lillooet, B. C., from San Francisco.

J. W. GIROUX, for the past two years Supt. Gladiator mine, Mayer, Ariz., goes to the Bradshaw mountains.

L. R. MEAD, Sec. Risdon Iron & Locomotive Works, San Francisco, has returned from an Eastern business visit.

H. W. FAIRBANKS has returned to Berkeley, Cal., from an extended geological reconnoissance in Vancover Island.

PROF. A. VAN DER NAILLEN has returned to San Francisco from an extended scientific itinerary through Europe.

PROF. S. B. CHRISTY, of the University of California, has been elected Pres. Alameda Co., Cal., Miners' Association.

H. T. SCOTT of the Union Iron Works, San Francisco, goes to Washington, D. C., next month on Government business.

FRANK L. BROWN, Pacific coast Mgr. American Steel & Wire Co., has returned to San Francisco from Los Angeles, Cal.

PH. DEIDESHEIMER has returned to San Francisco from a professional trip to Big Oak Flat mines, Tuolumne county, Cal.

E. M. RAY, formerly of Cripple Creek, Leadville and Aspen, Colo., is in charge of the Bassick mine at Silver Cliff, Colo.

I. C. JACKLIN, who has charge of the De Lamar cyanide plants in Utah, has been investigating the ores of Republic, Wash.

SAM'L J. HENDY, of the Joshua Hendy Machine Works, has returned to San Francisco from a business trip to Eureka, Nevada.

G. W. BORROWE, consulting engineer of the Bechuanaland Exploration Co., South Africa, returns from San Francisco to Buluwayo this week.

WM. L. MCCAGUE, formerly with the Victor Sampling Co., is now Supt. of the sampling works of the National Gold Extraction Co. at Goldfield, Colo.

W. D. CORNISH, Pres. Oregon Short Line and Vice-Pres. Union Pacific, will soon be Vice-Pres. Oregon Railway & Navigation Co. and the Oregon Short Line; E. H. Harriman will succeed him as Pres. of the latter road.

W. B. VANDERLIP JR., who for three years past has been investigating placer deposits in Siberia for the Russian government, with headquarters at Vladivostock, is in San Francisco, Cal. He returns to Siberia in February.

IN the event of a positive declination on the part of Lieut.-Gov. Neff to accept further reelection as Pres. California State Miners' Association, Hon. E. C. Voorhies of Amador is looked upon by many as a suitable man for that position.

A. EKMAN, in charge of the California mineral exhibit at the Paris Exposition, is in the State Mining Bureau at San Francisco, superintending the packing and shipment of specimens secured. His Paris address will be 8 Place de l'Opera.

J. F. BURNS, J. F. Champion, S. D. Nicholson, J. Winchester, F. Woods, W. S. Buckley, S. V. Newell, W. D. Brainard and H. P. Lillibridge are the ten Colorado mining men chosen delegates to the California Miners' Association convention to be held in San Francisco October 23d.

Books Received.

"*Stories of Our Mother Earth*:" 220 pp., octavo, profusely illustrated; H. W. Fairbanks, Ph. D.; written for little folks but interesting to children of larger growth. There is not a dull line in the twenty-eight chapters, and the statements are geologically correct. "The Story of Petroleum," "The Work of the Wind," "Where Quicksilver is Made," "How Islands are Formed," are interesting and well told. Wittaker & Ray Co., San Francisco.

"*The Fireproofing of Steel Buildings*;" J. K. Freitag, C. E., 319 pages, octavo; treating exhaustively on the construction of modern buildings and methods of rendering them capable of resisting severe attacks of fire and water with a minimum of repairs after the fire. Illustrated. Published by John Wiley & Son., New York City; $2.50.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PUMP FOR GASOLINE GAS MACHINES.—E. J. Crawford, Campbell, Cal. No. 634,612. Dated Oct. 10, 1899. This invention relates to apparatus which is designed for the manufacture of gasoline or hydrocarbon gas, and has for its object the connection of a generator, an air pumping mechanism and means for automatically regulating said mechanism. It consists of a double walled tank and a double walled cylinder open at the bottom and closed at the top with the walls of the cylinder embracing the inner walls of the tank. There is an air inlet pipe within the cylinder having an upwardly opening valve which admits air as the cylinder rises and cuts off the flow of air as the cylinder descends. A hydraulic motor is vertically disposed within the double walled cylinder and has a stem and piston connection therewith. An air pipe leads from the interior of the double walled cylinder, a water supply pipe with branches leads to points above and below the piston, valves in the branch pipe and levers connected with the stems of the valves. The supplemental cylinder and plunger rod extends from the same having one of the valve levers connected therewith so that the valves are operated in unison.

RATCHET DRILL.—C. S. Stafford, assignor of one-half to J. H. Blakeway, all of San Francisco, Cal. This invention relates to improvements in ratchet drills. It consists essentially of a hollow head with a handle by which it may be turned, a stationary ring fitting within the head having a central sleeve through which the drill spindle and socket piece pass. Beveled pinions are journaled radially within the stationary ring and ratchets having beveled gears attached to them to engage the pinions upon opposite sides. One of said ratchets has a key or feather which engages a corresponding key-way in the drill spindle and pawls are pivoted upon the head or handle engaging the ratchets, stops are employed against which the opposite sides of the pawls contact to alternately prevent one ratchet from turning, while the other is allowed to move freely. In conjunction with this is a feed screw spindle and socket piece in which it is turnable, said socket having a ball-bearing disk and race-way as its head and corresponding race-way in the yoke and balls fitted in said race-way.

Recently Declared Mining Dividends.

Homestake M. Co., regular 25 cents, and extra 25 cents; payable Oct. 25. Total, $7,933,750.

Amalgamated Copper Co., $2 per share; Oct. 16.

Mercur G. M. Co., Utah, $50,000; Oct. 20.

Bullion-Beck, Utah, $10,000; Oct 14.

Deer Trail No. 2, Washington, $2500; payable Oct. 25. Total, $42,500.

Grass Valley Exploration Co., California, $7500; Oct. 20.

April Fool M. Co., Nevada, $5000; Oct. 20.

A New Arizona Gold Mine.

TO THE EDITOR:—The King of Arizona gold mine is one of the largest properties of its kind in Arizona. The mill recently erected is of a type not commonly in use. The ore is crushed dry and treated by the cyanide process without amalgamation, principally because of the necessity for economy in the use of water. The mill is working perfectly, making a very high extraction, and less than 35,000 gallons of water are required for the treatment of 100 tons of ore per day. The company had previously hauled its ore to be treated at a 5-stamp mill at the Gila river, thirty-five miles distant. Drinking water was brought a distance of twenty-two miles. This made the development of the mine very expensive. Water in ample quantity has been found in one well four miles from the mine, and in another twelve miles distant. These holes were bored in the gravel, in the valley, and the water was struck at 1000 feet and 500 feet depth, respectively, and is piped to the mine. The ore is trammed from the mine to the mill by hand, and upon being dumped into a bin passes through a Gates crusher, is elevated to revolving screen of ¼-inch mesh, then passes through a set of slow-speed Gates rolls (Argall type). From these it is again elevated and screened when it passes to three sets of high-speed rolls of the same pattern which crush to 30 mesh.

KING OF ARIZONA MILL, YUMA COUNTY, ARIZONA.

The pulp is dumped into six steel vats 6 feet high and 50 feet in diameter and goes through the usual process of cyaniding, which in this case requires from eight to ten days time. The vats are sluiced out and the water used over again. Two 80 H. P. boilers and a 75 H. P. Corliss engine furnish the power required. The ore is principally hard porphyry, with considerable quartz, calcite, and heavy spar, and requires fine crushing. Notwithstanding the fact that there is a great deal of high-grade ore, the values are easily recovered, as the gold is extremely fine and well disseminated. The ledge occurs in porphyry and outcrops for over 2000 feet, varying from 12 to 30 feet in width. It is now a producer, and with an output of 100 tons a day it will take front rank with the leading producers in the southwest.

Gila City, Oct. 7th, '99.

LEAD ORES are reported as being shipped from Guaymas to Germany as ballast. Sailing vessels arriving at that port with merchandise often find it difficult to secure a full return cargo. The ore has to be transported a long distance to Guaymas at large expense, but it is estimated that at the present price of lead it will pay, as it costs little to ship it. Two small vessels have been loaded with high-grade ore carrying a small per cent of silver. The ore is taken from a mine near Buena Vista. The large lead deposits are seventy-five miles farther east. A German company is making the experiment.

Calkins' Cupel Machines.

F. W. Braun & Co., of Los Angeles, Cal., are making and selling three styles of machines that are of interest to assayers everywhere, as the makers claim that these machines will make perfect cupels, quickly, easily and cheaply, and each assay office can have by their use just the kind of cupel required. The three varieties are known as the Automatic, the Table, and the Wall machine. The Table is herewith illustrated.

Fig. 1 shows the Table pattern cupel machine with tray holding the properly moistened bone ash in position for filling the mold.

Fig. 2 shows Table cupel machine after the compression has been made and before the plate forming the bottom of the mold has been slipped away from under the mold or ring in which the cupel is compressed.

Fig. 3 shows the Table cupel machine after the plate forming the bottom of the ring or mold in which the cupel is formed has been slipped away from under the mold, thus permitting the cupel to be expelled through the mold and into the hands of the operator. After having expelled the cupel, the plate, or bottom of the mold, is slipped back under the mold, and the bone ash on the tray is pushed into the mold until the mold is even full, when another cupel may be made by going through the operations above described. F. W. Braun & Co., Los Angeles, Cal., will send an illustrated circular to any one interested therein.

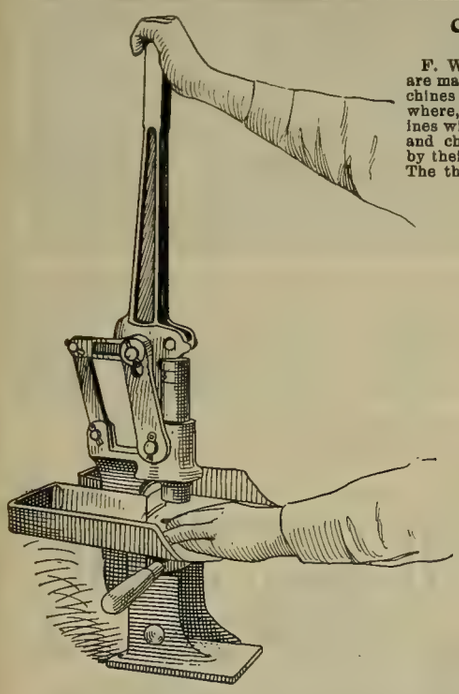

FIG. 1.

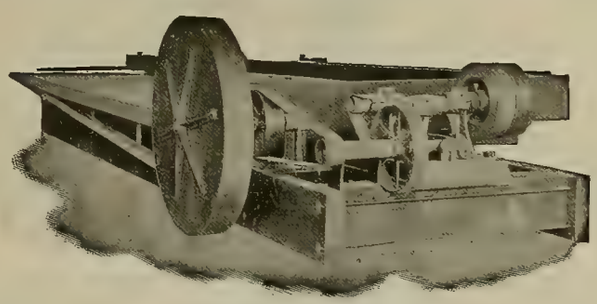
30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

Over 2000 in Use.

KEPT IN STOCK READY FOR SHIPMENT.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

THE WILFLEY CONCENTRATORS HAVE LARGE CAPACITY, EASY ADJUSTMENT, ARE SIMPLE IN CONSTRUCTION, AND NOT LIABLE TO WEAR.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : : :

BOILERS.

"STANDARD" TUBULAR STATIONARY BOILERS.

Our "Standard" boilers are made of "Best Flange" Open-hearth Homogeneous Steel Plate, of 60,000 pounds tensile strength. This steel will turn over and close down solid without fracture, when cold, or after heating and cooling in water, and will not blister.

In all sizes up to and including No. 17, the bottom of the boiler will be without seams, except around the heads.

The great advantages of a boiler made in this way are apparent; the bottom presents a smooth, even surface, which prevents lodgment of sediment and burning of plates.

The longitudinal seams of the shell are double-riveted, and the domes of No. 4 and larger sizes double riveted to boiler. The edges of the plates are planed, and the calking is done by Connery's patent concave system.

Special attention is given to the bracing, which is a most important item in boiler construction, and enough braces used to insure a large factor of safety.

DEWEY, STRONG & CO.,

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

Can I Become An Electric Mining Engineer?

YES, You Can. We guarantee we can make a thorough electric mining engineer of you at your home by our new system of correspondence instruction. Our instruction papers are prepared by the highest authorities and include every branch and method employed successfully to-day in electric mining. Course includes: General conditions of mines; Systems for the application of power; Mine wiring; Signaling; Electric haulage; Hoisting motors; Operation of electric mining installations; Cost of electric mining equipment, etc Our terms are within reach of all: $5 or $3 per month or cash in advance. *Write for our free illustrated book* (120 pages); it will pay you to read it. We teach also **Electrical and Mechanical Engineering, Mechanical Drawing,** Telegraphy, Telephony, etc., by mail. THE ELECTRICAL ENGINEER INSTITUTE OF CORRESPONDENCE INSTRUCTION, Dept. 21, 120-122 Liberty Street, New York.

I consider the Electrical Engineer Institute as conducted by Messrs Wetzler and Martin to be of great value to those who desire an Electrical education
Thomas A Edison

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ¾-inch cable. The outfit weighs 3500 pounds.

IMPROVED Gold Pans.

First Invoice at Hand.....$1.50 Each.

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

P & B ROOFING

ROOFING is to a building what clothing is to the body. It must protect and it must wear well. To put money in an interior and to save it on the roof of a building is poor economy.
P & B ROOFING possesses all the requirements of a first-class roof covering. It is waterproof, durable, inexpensive, easily laid. Ask your dealer for a circular, or address the makers.

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he out three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to

NO MORE PACKING DIRT TO WATER.
THE
PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

Market Reports.

SAN FRANCISCO, Oct. 19, 1899.

SILVER.—London, 26 11-16d; New York, 57⅞; San Francisco, 57⅞; Mexican Dollars, 47⅞@48⅛; New York exchange, sight, 10; telegraphic, 15 cents premium.

Secretary Lyman Gage, while in Denver, prophesied a rise in the price of silver and advocated the coinage of the dollar coined by England and the Mexican dollar coined by the Mexican Government in the Orient. He said that such a dollar need not be made legal tender in this country, but that it would circulate freely in our new possessions. He says that he will present a bill to this effect in the next Congress.

LEAD.—New York reports dull, $4.57½ bid, $4.62½ asked; brokers' price, $4.40.

Local, pipe, 7¼@7¾c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6½c.

COPPER.—New York reports Lake very quiet at $18.25; brokers' price, $18. Local—Mill copper plates, 23¾c.

The copper market appears weak, and has fallen a fraction within the week. Most of the large mines have disposed of their product for the present year. The copper market will be influenced by the price made by Calumet & Hecla at its next sale.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—11½@20c per pound.

TIN.—Dull, $31.50 bid and $32 asked; pig, 36@39c per lb.

The tin market has been quiet lately. Most of the recent fluctuation is apparently due to manipulation of speculators.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $47; export, $42@42.50; carload lots, special rates.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

PLATINUM.—London, 66s per ounce; New York, $17.75; San Francisco, $17.25.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c ℔ lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5¼@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¼@1½c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ℔ 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7½c; 6s, 12 oz., 5¼c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6¾c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.20; less than 200 gals., $1.25; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 56c; cs., 66c; raw, bbl., 54c; cs., 59c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 19c; Astral, 19c; Star, 19c; Eocene, 21c; Extra Star, 23c; Elaine, 24c; Water White, bulk, in tanks, 13c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 47c; cs., 52c; No. 1 bbl., 42½c; cs., 47½c; Neatsfoot Oil, bbl., 55c; cs., 65c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

Notice of Application for Dissolution.

In the Superior Court of the City and County of San Francisco, State of California.

In the matter of the application for the dissolution of the corporation named, THE GRASS VALLEY WATER COMPANY. Dept. No. 2. No. 70,052.

Notice is hereby given that said corporation, THE GRASS VALLEY WATER COMPANY, on October 17th, 1899, made a voluntary application for dissolution, in writing, to said Court;

That said Court thereupon on said 17th day of October, 1899, made an order directing that said application be filed with the Clerk of said Court, and that said Clerk give thirty-five (35) days' notice of the application by publication in the newspaper named, "Mining and Scientific Press," the same being a newspaper published in said City and County, and that this notice is now given, and will be published according to said order in said newspaper, "Mining and Scientific Press," during the period of thirty-five (35) days from and after the 20th day of October, 1899, the first publication being made on Saturday, October 21st, 1899.

Given under my hand and the seal of the Superior Court of the City and County of San Francisco, State of California, this 17th day of October, 1899.

W. A. DEANE,
County Clerk.
[SEAL] By E. M. THOMPSON,
Deputy Clerk.

Notice of Application for Dissolution.

In the Superior Court of the City and County of San Francisco, State of California.

In the matter of the application for the dissolution of the corporation named, NORTH STAR MINING COMPANY. Dept. No. 2. No. 70,053.

Notice is hereby given that said corporation, NORTH STAR MINING COMPANY, on October 17th, 1899, made a voluntary application for dissolution, in writing, to said Court;

That said Court thereupon on said 17th day of October, 1899, made an order directing that said application be filed with the Clerk of said Court, and that said Clerk give thirty-five (35) days' notice of the application by publication in the newspaper named, "Mining and Scientific Press," the same being a newspaper published in said City and County, and that this notice is now given, and will be published according to said order in said newspaper, "Mining and Scientific Press," during the period of thirty-five (35) days from and after the 20th day of October, 1899, the first publication being made on Saturday, October 21st, 1899.

Given under my hand and the seal of the Superior Court of the City and County of San Francisco, State of California, this 17th day of October, 1899.

STOCKHOLDERS' MEETING.

Notice of Stockholders' Meeting of the Oneida Gold Mining & Milling Company.

In accordance with a resolution passed by the Board of Directors of the Oneida Gold Mining & Milling Company, a meeting of the Stockholders of this company will be held at 2 o'clock in the afternoon on TUESDAY, the 24th day of October, 1899, at its principal office, Room 24, No. 320 Sansome St., San Francisco, California, to consider and vote upon a proposition to increase the capital stock of this company to Two Million Dollars in Four Hundred Thousand Shares at the par value of Five Dollars each. JOSEPH H. MOOSER, Secretary.

Dated San Francisco, Cal., Sept. 8, 1899.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Henry H. Meyer et als., in the French Claim, at Alabama Hill, near Downieville, Sierra Co., to deposit tailings in a ravine below the mine; from E. J. Sinnott and F. M. Spencer, in the Hopkins Creek Tailing Claim, in Goodwin Township, Plumas, Co., to deposit tailings in Hopkins Creek; and from James C. West, in the Eagle Gulch Mine, in Butte Co., near Strawberry Valley, to deposit tailings in a worked-out pit, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on October 30, 1899, at 1:30 P. M.

Assessment Notices.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of October, 1899, an assessment (No. 9) of ten (10) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of November, 1899, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 21st day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California. Office hours from 1 to 3 P. M.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of September, 1899, an assessment (No. 20) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of October, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1899, an assessment (No. 1) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of October, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of November, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of September, 1899, an assessment (No. 13) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1899, will be deliaquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1899, an assessment (No. 33) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 31, 10th floor Mills building, San Francisco, California.

ANDES SILVER MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of October, 1899, an assessment (No. 49) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of November, 1899, at 1 o'clock P. M., to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

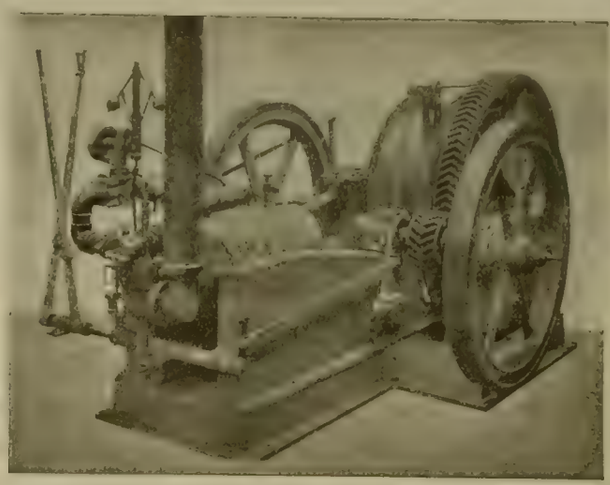
By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of October, 1899, an assessment (No. 8) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.



Any stock upon which this assessment shall remain unpaid on the 11th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Mines and Scenes in British Columbia.

Among the numerous beautiful sheets of water in British Columbia is that known as the Upper Columbia lake. These lakes, some of them merely the widening of a river, are all picturesque and form one of the most pleasing features of that scenic region. Within two miles of Upper Columbia lake a number of locations have been made on a series of quartz ledges, all of which are similar in character. There are several groups of claims, prominent among which is the Thunder Hill, which is described by the Provincial Mineralogist in his last report. The group consists of four claims, on which over $12,000 had been expended in development and improvements, not including a tramway from the mines to the concentrating mill, two miles distant. The main workings expose a vein 100 feet wide. An interesting fracture has taken place across the strike of the ledge, with a displacement of 50 feet. Where the ends of the broken ledge abut there was found a concentration of galena, from which a large amount of ore has been taken and to treat which the mill was built. Galena is disseminated through the ledge, but nowhere else in as great quantity as at the fault referred to. Auriferous pyrite also is found, but not abundantly. The concentrator is built on a steep sand bluff overlooking Upper Columbia lake. It is equipped with rock breaker, crushing rolls, jigs, buddles and all necessary devices for concentrating the ores of the mines.

Lake Windemere, in the East Kootenay division, is formed by a broadening of the Columbia river and is a beautiful sheet of water, navigable for small vessels. One of the accompanying engravings is that of the lake steamer Duchess at a landing.

The engravings giving views of the Thunder Hill concentrator and of Lake Windemere form a striking contrast with the wild mountainous scenes depicted in the remaining engravings. That of Mt. Thomas is reproduced from a photograph taken from the Pretty Girl mine, which is situated on the head of Boulder creek at an altitude of 9250 feet and 3000 feet above the canyon. The summit of the mountain, snow-capped and treeless, rises several thousand feet higher.

Even more wild and forbidding is the illustration of Spillimachene mountain, buried in snow and surrounded by deep chasms, from the depths of which comes the thundering roar of a rushing mountain torrent. Yet even on this mountain the prospector has built his monuments and opened veins rich in galena and copper. Ore from the Hidden Treasure, on this mountain, returned 53% copper.

The Influence of Forests Upon Storage Reservoirs; New Demand for Aluminum; Ammonia as a Fire Extinguisher; Draining Wet Tunnels, 494. Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends, 497.

WHEN experimenting with metallurgical processes it is better to endeavor to adapt the process to the ore than to search for an ore adapted to some pet process.

THE paying of unearned mining dividends is a reprehensible practice that usually ends disastrously. It is noticed that there are mines in the market today declaring regular dividends which are not earned, though the public is led to believe that they are.

MINING is an industry that thrives in almost every land. For years the hardy advance guard of this great industry have been pressing farther and still farther northward until they are now winning success on the edge of the arctic circle, and they are looking beyond it. For centuries the lands of the temperate and the tropical zones have yielded their mineral wealth to the tireless workers, who still continue to find new fields in the unknown wilderness of Africa and in Oceanica.

A CONTINUANCE of the war in South Africa for any considerable period will no doubt result in widespread commercial disturbances for the reason that the sudden discontinuance of one-third of the gold output of the world cannot but have its effect. No doubt it will materially affect the zinc mining industry also in the United States by a falling off in demand from South Africa of zinc for cyanide operations, it being doubtful if the necessary demand from other directions will equal the loss in the Transvaal.

ELSEWHERE herein appears a contribution on The Progress in Ore-Reducing Machinery, which is a brief resume of advancement in this direction during the past fifty years. While all mining engineers are agreed that the stamp as applied to the crushing of ores is not perfection itself, still it is the most simple machine in use for this purpose, and it is doubtful if it will be generally supplanted. That rolls are superior to stamps for the crushing of heavily sulphureted ores which are to be concentrated is generally understood, but that any one method of crushing ore of all classes will come into universal use is doubtful, for the reason that ores of various character require different treatment. Stamps will probably not be replaced by other devices for crushing hard, free-milling gold ores or any ores which do not slime abnormally, and rolls will come into more general use for crushing heavily sulphureted ores, while a combination mill, including the ball mill, will find its field of usefulness as well.

The California Miners' Association.

Elsewhere is given a summary of the transactions of the eighth annual convention of the California State Miners' Association. To publish all of what was done and said would transcend the limits of the entire twenty-eight pages of this issue.

The California Miners' Association is unique. It is not the first California Miners' Association, but it has longest held together, has done most for the mining industry, and gives promise of future value. It is looked to by other similar organizations, and its transactions and record are cited as models or guides for similar action. It has the best skill in the State or on the coast at its constant command. Mining lawyers, mining experts and skilled miners, practical men, professional men, State and national officials, men of brains, experience and knowledge—all serve the Association and give of it their valuable time without pay. Men who would courteously decline to take up a matter concerning mining within their province for less than a retainer of $1000; men with large business interests, requiring their constant personal supervision, will, at the behest of the Association, leave their homes, pay their own expenses, and toil for two days and part of two nights preparing reports, or drafting resolutions, or securing necessary funds, or information, or give expert advice, or do whatever else is delegated to them by the Association, with no thought of asking or expecting any financial return. Men of affairs also gladly give their time to furthering the interests of the Association in a variety of ways, with no expectation of advertisement therefrom or personal reward. This is the unique part of it: that the Association has constantly been able to secure high-class service without pay, and with the constant understanding that no one is to make anything out of his position.

There are things in this world that can not be bought, and the California Miners' Association is able to get free of any charge what would annually cost it $100,000 were ruling rates for such high-class work to be charged. It spends a little money; it has collected and paid out about $50,000 in its seven years of existence, and is in funds. The Association is purely voluntary; it is not even incorporated; it has no source of income but voluntary contributions, a nominal assessment of $1 per year from each member, and contributions from merchants, manufacturers and others who realize what such an organization means to the mining industry.

The Association has steadily declined to mix up in politics, to shoulder any one's responsibilities, to take up any one's troubles, or to put any one into position. It has steered clear of entanglements that might wreck it, and, while it has made some mistakes, has done so much, and, throughout, acted so wisely, as to merit general commendation. It has no organ, no one to be taken care of, and with enlightened selfishness tries to get the best out of every man, to the end that the general good shall be subserved. Its life will be in exact proportion to its usefulness, and if the miners of California should decide that it is no good to them, or not run in their interests, its subsequent days would be very short. Its chief danger would lie in the possibility of getting away too far from its original purpose, in ignoring the immediate needs of the men who make up its membership, or of trying to spread itself over too large and ambitious a programme. So long as it is run by miners, for miners, and in the interests of the mining industry, it will prosper, and deservedly.

The annual meetings are only public and prominent yearly manifestations of its existence. The yearly conventions are for consultation, reports, elections, and that renewed enthusiasm always resulting from personal contact of zealous workers in a common cause. But the real work goes on unceasingly, continuously; never hasting, never resting, it works on through its officers and committees without cessation, and much of the prosperity of the mineral industry of the State is due to its existence, influence and example.

In South Africa the English signal corps are to try wireless telegraphy in instances where the wires have been cut by the Boers. If this can be accomplished successfully it will practically render the cutting of telegraph wires on land useless.

The Advantages of Sorting.

Undoubtedly much of the rock put through quartz mills does not contain sufficient value to pay for its crushing, while encroaching upon the capacity of the stamps which might be employed in crushing pay rock. The question for the mine manager to determine is: does the rock being sent to mill contain waste, and, if so, how and where shall it be gotten rid of—underground or on the surface?

In some mines the barren rock occurs in large masses, interstratified, as it were, with pay rock, and the conditions are such that the waste may be left standing, as pillars, which to some extent help in supporting the ground. In others this cannot be done, and the waste must be mined together with the ore. Here, again, the question of sorting must be determined by existing conditions. If the waste occurs in large blocks, these may be rejected by the miners—who usually are able to distinguish the difference between waste and ore—and used as filling. If, on the other hand, the waste breaks small and, from necessity, becomes intimately mixed with the ore, then the sorting would be more effective, expeditious and less expensive on the surface, where boys or cheap men might be employed in this light work. Where this is necessary, the cost of tramming and hoisting has to be taken into consideration.

As a general proposition, all rock which, having reached the surface, contains sufficient value to pay even the cost of milling, or near it, should be crushed, as being less expensive than sorting. Where large amounts of ore are crushed and the tailings are subsequently cyanided, the crushing and after treatment of waste rock amounts to a large sum in the course of a year.

In the case of a 100-stamp mill crushing 400 tons of rock daily at a cost of 40 cents per ton, if 10% be waste, containing no value, then the cost of crushing this waste would amount in one year to $5840, bringing the cost of crushing the 360 tons of pay rock daily to 44+ cents per ton. If the cyanide process be subsequently employed in the treatment of the tailings in bulk, an additional expense is entailed in direct proportion to the cost, as in the mill, so that it becomes evident that the management can afford to expend the amount of the cost of crushing the additional waste rock in sorting it out, for it will result in ultimate gain in subsequent treatment.

On the Rand in South Africa, during July, the 5930 stamps in operation there crushed 804,000 tons of ore, though 1,009,000 tons were delivered at the mills. The difference, 205,000 tons, was waste, and represented 20.3% of the entire amount raised. To have crushed this additional amount while securing the same capacity on pay rock in the mills would have required an additional 1200 stamps.

Generally speaking, it pays to sort ores going to mills where crushing is done on a large scale at low cost; but where ores are shipped to custom mills and smelters, where transportation charges and treatment are high, the reasons for careful sorting are obvious.

AN energetic and observant miner in Arizona has discovered that some copper prospects on Castle creek in that Territory "are on the fault fissure which runs from the copper mines of the Grand canyon of the Colorado through the United Verde, the copper mines of Bigbug, the Ajo, and on to the French copper mine on the Gulf of California." In having made so valuable a discovery it seems unfortunate that he did not look farther and he might have as easily reached the conclusion that the northward extension of the same belt took in the Paradox mines in Utah, the Grand Encampment, Wyoming, and the copper mines of Butte, Montana. To believe this would require no great stretch of such an elastic imagination as that possessed by this discoverer.

IN view of the approaching convention to be held in San Francisco, Cal., on Nov. 14, for the purpose of considering that important topic, "the conservation of water," the article written by Jas. D. Schuyler, which appears on page 494, is of more than ordinary interest. The annually recurring drought in the State of California suggests that some active measures be taken to restrain and conserve at least a portion of the billions of gallons of flood waters that now, for the most part, flow away and are lost.

Concentrates.

A FLASK of quicksilver contains 76½ pounds, and is worth at present prices about $47.

WAGES of employees at the Ontario mine, Park City, Utah, have been raised 25 cents per day.

THE shipment of nitrate from the Chilean mines, it is said, will reach 30,000,000 quintals this year.

THE new Osceola mine, owned by the Calumet & Hecla Co., on Lake Superior, is said to be the largest new mine opened on the lake in recent years.

WHEN the manufacture of aluminum was first commenced in Pittsburg, Pa., it sold for $17 per pound. Its present price is 31 cents per pound.

THE noise and other discomfort attending a steam escape can be obviated by the use of an exhaust head, supplied by any dealer in steam fittings.

THE United States Geological Survey corps is at present compiling a topographical map of the Bingham and West Mountain, Utah, mining districts.

THE city of Chicago has 1000 miles of electric railway, 250,000 incandescent lights, 10,000 arc lights and 20,000 H. P. supplied from central stations to small motors.

PROSPECTORS searching for ideal conditions, or for conditions in a new country similar to that with which they have become familiar elsewhere, are often disappointed.

IN concentrating ores, the more valuable the concentrated material the more care should be taken to secure a clean and complete separation of the valuable from the worthless portions.

SOLDIERS returning from the Philippines who are from the mining regions of the United States unite in saying that there is gold in the islands, but none of them claim them to be very rich.

A WIDE AWAKE MINER at Butte, Montana, is said to have discovered a fractional piece of ground adjoining the Parrott ore-house in the heart of the Butte mineral zone, and located it under Federal laws.

A NUMBER of instances of the discovery of rich veins of ore by crosscutting have been recently announced. The importance of crosscutting in mines either old or new should not be underestimated.

LEADERS of the miners' union in the Slocan, B. C., mining district have endeavored to induce from mine managers a guarantee to miners working on contract a minimum wage rate of $3 50 per day. This has been refused.

THE confidence in the value of the California gold mines at great depth is evidenced in the large amount of money being invested in sinking deep vertical shafts and in their equipment with heavy modern machinery.

ACACIA has been found to make good mine timbers when the trees are thirty or more years of age. For some purposes redwood makes a superior mine timber, being enduring and not suffering materially from decay.

LARGE quantities of water in a vein are not an indication of valuable ore bodies, though they often prove the necessity of liberal assessment. Some very profitable mines are comparatively dry while some extremely wet ones never have paid anything.

ALL the silver smelted in Russia is extracted from argentiferous lead ores. All the gold produced in Russia contains silver. Silver smelted by private individuals is subject to a tax, reduced in 1887 from 15% to 3% for freehold and 4½% for leasehold works.

STEEL cement is now made from furnace slag, which, after going through certain processes, is combined with other ingredients, with the result of a cement that has exceptional strength and durability, being especially suitable for heavy foundation work.

IN the early days of mining in Leadville solid masses of silver chloride (horn silver) weighing many pounds were taken from mines on Fryer hill. In southern Yavapai county in 1890 a number of lumps of horn silver were picked up in placer mines by Mexicans.

THERE is a tendency in mining regions where water is sufficiently abundant to utilize the power which the water will furnish and transmit it by electricity for operating machinery, dispensing with fuel and the direct application of power by impact wheels.

A VERY high heat has been obtained in the reverberatory furnace by means of the petroleum blast, but this method has not, as yet, been successfully applied to the manufacture of iron from ore, though natural gas has been used for this purpose with success in Pennsylvania.

THE mining camps of Pioche, Nevada and Tombstone, Arizona, each had a similar experience with regard to water. Down to about 1100 feet the mines were dry, and below that level, in each instance, the water was so abundant that mining operations were partially suspended.

WITHIN recent years the discovery of rich deposits of gold, silver and other ores in quartzite has attracted more attention to rocks of that character. Usually these ore deposits in quartzite are accompanied by dykes of eruptive rock. There are important exceptions to this, however.

IT is thought by some competent mining engineers that the tunnel talked of for draining the mines of Leadville, Colo., which would start at Malta, is not a good business proposition, as it would be 30,000 feet in length and would not reach to as great a depth as the deepest mines in the district.

THE relative age of ancient river channels is usually determined by their position and often by the character of the volcanic cap. Unless the course of the channels intersect, it is not always possible to determine the relative age. Usually the channels which have cut to the greatest depth are the latest, but there are exceptions to this.

WOLFRAMITE often occurs associated with tin ores, and in this relation is found in the Black Hills of South Dakota, where it occurs in the granite dykes with cassiterite. It was formerly called by Cornish miners mock lead, they believing from its great weight that it contained lead. It occurs in numerous localities in the United States. In Connecticut, in Fairfield county, the wolfram ore occurs as wolframite, scheelite and wolfram ochre at contact of crystalline limestone and gneiss, in a vein 3 to 5 feet thick.

BY business men advertising is not done on the basis of doing a favor to the publisher, but is looked upon as an investment that is expected to yield a profit. Careful thought and consideration are given to the claims of a paper before the judicious advertiser pays it money. The value of an advertisement is to be determined by the results.

WHILE most of the mines thus far worked in the Cripple Creek district of Colorado occur in andesite breccia, and many of the veins are associated with phonolite dykes, some of the richest veins of the district are found in the underlying granite, notably those of the Independence mine, indicating the depth to which these veins may go.

THE Newhouse tunnel, being driven at Idaho Springs, Clear Creek county, Colo., will be, when completed, five miles in length. It is expected to intersect in its course 1140 veins, and will reach the California vein at a depth of 2400 feet, the shaft of that mine being down 2300 feet. The tunnel is 12x16 feet. It is being driven with power drills.

THE zinc and lead fields of southwest Missouri, southeastern Kansas, and extending into Arkansas, occur in what is known as the Ozark uplift, the outline of which covers an area of about 50,000 square miles. It is 320 miles in length and from 200 to 250 miles in width. Its geological structure is that of an elevated plateau bounded by monoclinal folds.

ORE deposits in sedimentary formations such as limestone, sandstone, shales, and quartzites are nearly always connected by fissures which extend to great depth. In some cases these fissures are occupied by intrusive dykes and often they are not, but careful inspection will generally discover that the ore deposit has direct connection with a fissure or a fissured zone.

BEFORE a mill is ordered or an addition to one already in place is made, there should be enough ore in sight to justify it. If it is intended for custom work it is just as essential to know that the ore is available in the camp as though the mill were built for a single mine. It is equally essential to know that the process by which it is intended to work the ore is applicable to it.

THE necessity for a cheap process to treat the lead, zinc and copper iron ores still exists. The spelter made from these complex or mixed ores is inferior to that made from pure zinc blende. A process of separately concentrating the zinc from the other sulphides is also required. Zinc blende is not as heavy as the sulphides of lead, iron or copper, yet is most difficult to separate from these ores when associated with them.

A NEW use for copper has been found in electroplating hulls of iron vessels. The United States Government in 1895 plated the hull of the sea tug Alliance with copper. A few days since this vessel was placed in dry dock and her hull, upon examination, was found wholly free from marine growth, in consequence of which the engineers have recommended that all the other vessels of the navy be treated likewise.

METAL-BEARING veins often occur at the contact of a dyke and a sedimentary rock, as porphyry and limestone. In some instances the ore occurs wholly within the limestone, as a replacement of the original mineral, and in other cases the mineral is wholly confined to the dyke. In either case it would be termed a contact vein. Most of the veins of the Salt Spring Valley district, in Calaveras county, Cal., are in the form of massive quartz replacing a dyke rock of the diabase type.

LENGTHY tunnels run for drainage and transportation of ores are only advisable when it is known that the values to be recovered justify the expense. Where mines opened through shafts have proven rich, and operations were suspended owing to heavy influx of water which could not be otherwise controlled, a tunnel to drain and ventilate the mines becomes a necessity and is a good business venture if not driven too far below known valuable ore bodies.

THE idea that numerous small stringers of ore will lead to large bodies of mineral is not always sustained by development of the stringers, though such condition is not uncommonly found to obtain. The Bimetallic shaft near Philipsburg, Montana, was sunk in a marshy spot in the granite. At this place there were a number of small iron-stained seams, which were recognized as an extension of the Granite Mountain vein. At a depth of 65 feet a rich vein of ore opened several feet wide, and this shoot produced millions of dollars.

AS A GENERAL principle in concentrating ores very fine crushing should be avoided in all cases, as the sliming of ores, which is an inevitable result of such fine crushing, renders it more difficult if not impossible to collect the finely divided material. In ores in which the mineral occurs in finely disseminated particles the ore may be granulated to a condition which will admit of a partial concentration by jigging with relatively small loss, as compared with the results of concentrating the same material after having been reduced to slimes by over-stamping.

A METHOD of separating nickel from copper-nickel ores and mattes is by smelting the mixed sulphides of iron, copper and nickel with an alkaline sulphide, or with acid saltcake. When tapped the sulphide of nickel settles to the bottom, with a small proportion of tin, copper and iron sulphide, while the sulphides of iron and copper, with a very small proportion of sulphide of nickel and a large portion of the salts of the alkali used form a distinct upper layer which is easily removed. By retreating the bottoms a still further separation is effected, until ultimately pure nickel sulphide is obtained.

AT the Black Hawk mines in San Bernardino Co., Cal., large masses of stratified limestone are found crushed into millions of fragments, the most of them being less than 3 inches in diameter, and in certain zones the rock has been granulated by compression and movement. These zones are gold-bearing, the gold occurring with a finely disseminated dust-like hematite iron. In some of the claims the iron is found concentrated into bunches and veins and is rich in gold. The entire region has been subjected to an extensive system of faulting, which has had a marked effect on the topography of the country. Lying out on the desert plain four miles from the Black Hawk mines is a nearly flat limestone formation, in which the rock is crushed in the same manner as that at Black Hawk. In the latter case the limestone contains chloride and bromide of silver with some lead. Some of these ores contain several hundred ounces per ton, but no large body of ore has been found at one place.

THE Dutch word "Witwatersrand" means literally "White Water Range," applying to a strip of territory a few hundred miles long and a few miles in width, which, seventeen years ago, was considered a worthless ridge. In 1883, however, gold was discovered. In 1884 the value of the gold production was about $50,000; the production of 1888 was about $5,000,000; that of 1890, $10,000,000; 1894, over $20,000,000; 1895, over $40,000,000; in 1897, about $55,000,000; in '98, about $75,000,000. The mines can only be successfully worked by the use of costly machinery, and while extremely productive where machinery has been used, they are not of such character as to make hand or placer mining profitable. The Boers own that country, the British want it, and the fight is now on.

IN the early days of California the claims on Stockton Ridge at Mokelumne Hill were 16 feet square, at first, and each claim holder undertook to sink a shaft. As the distance to bedrock varied from 50 to 250 feet, it soon became apparent that no one could reach the pay gravel under the circumstances. Numerous companies were formed and adjoining claims consolidated and in this manner the ground was worked. Even then the shafts were so close together as to often seriously interfere, as the scores of old dumps on the hills still testify. On top of the ridge shafts were sunk fifty years ago 250 feet deep, which are as good to-day as when first made, and not a stick of timber was used in them. The shafts are circular, 4 feet in diameter and are sunk through rhyolite tuff.

IN granular crystalline rocks, like granite, veins are often found breaking free from the walls which in depth are found "frozen." The reason may usually be found in the fact that the wall rocks have become altered or to some extent decayed, which causes the wall to part freely from the vein. In depth this condition does not obtain, and the ore shows no disposition to break free from the wall. In the deepest workings of such mines, however, there may be found places where the rock separates freely and there may even be a gouge seam, while other portions are frozen. This is due to the fact that the rocks are divided by fissures into great angular blocks and that these blocks have independent movements producing gouge seams along one portion of the vein while none are found on other portions.

THE world's production of tin is about 77,000 tons, of which Cornwall produces 5000 tons, or about 6%. The Straits Settlements lead in the production, with nearly 49,000 tons, or 61%; the Dutch East Indies contribute 19% and Australasia 8%; 80% of the world's total supply of tin comes from a comparatively small area, and is almost entirely in the hands of Chinese miners. In the early 60's Cornwall was producing about 10,000 tons of tin per year—about 50% of the world's total. The Cornish output then completely controlled the tin market; now the far East, with 80% of the total production, has become the dominant factor. The world's production of tinplates is about 725,000 tons per year; tinplate is sheet iron covered with from 2% to 8% of tin; hence, the total consumption of tin in the manufacture of tinplates is about 20,000 tons.

A NEW pneumatic cyanide process, known as the Johnson process, consists of expressing the water out of the slimes, obtained from the mills by means of a filter press, displacing the moisture and soluble cyanocides in the filter cakes formed in the press, by cyanide or potassium solution. The press is opened and the cakes of slimes dropped into a vortex mixing vat, containing cyanide of potassium solution, which is arranged so that air can be drawn into the vortex, facilitating the working of the cyanide. After the proper amount of cake and cyanide solution have been placed into the mixing vat, the agitator having been previously set in motion, the gold is brought into solution. The slimes are passed through a valve into a second receiver and forced into the leaching press. The gold leaves this press in solution and is run over boxes containing fine zinc, precipitating the gold in a metallic form. The cyanide containing gold that may be left in the filter cakes is displaced by pure water.

THE Mount Morgan mine in Victoria, Australia, one of the richest gold mines in the world, was described several years ago by R. L. Jack, Provincial Geologist, as being the result of a deposit of silicious sinter from thermal springs, which also deposited the gold. Since making this report, Mr. Jack has made a number of inspections of the mine at intervals of four or five years, and still insists that his original theory was correct. All American geologists and mining engineers who have examined this remarkable ore deposit fail to agree with Mr. Jack, and describe it as a quartzose rock—quartzite in part, impregnated by auriferous sulphides bearing gold. The ores are not susceptible to amalgamation and are treated by the chlorination process. The ore is dried in rotary ovens, crushed fine, roasted and then deposited in tanks provided with false bottoms and gravel filters and the chlorine gas turned in. The gold is recovered from the solution by passing through charcoal filters. This ore deposit has produced about $40,000,000.

AT the De Lamar mine, Mercur, Utah, the mill daily treats 500 tons ore, the oxidized ore going direct to the tanks, after crushing: the clayey ores are dehydrated in one roasting furnace, and the arsenic, antimony and sulphur removed from the baser ores in others, before cyaniding. The solution from the leaching tanks, of which there are ten, 25x50 feet by 5 feet deep, passes to three storage tanks, each 20 feet in diameter and 12 feet deep. From these it is drawn into the three precipitating tanks, 14 feet in diameter by 8 feet deep. Here zinc dust is added and the solution agitated by the admission of compressed air at the bottom of the tank. The solution is then pumped out through a filter press, and goes to the sump tanks to be used over again. The solution is not allowed to settle before pumping out, the idea being that by lessening the time of contact with the zinc in the tanks is secured maximum precipitation with a minimum loss of cyanide. There are five 18-frame filter presses, the frames being 24 inches square: the pipe through which the solutions are drawn off is 8 inches above the bottom of the precipitating tanks, so much of the precipitate accumulates in the bottom of the tanks and is cleaned up without going to the filter process. The strong solution used contains about 0.3% KCy; the zinc consumption amounts to about one-fourth of a pound per ton of ore treated.

Method of Working at the Taylor Mine Cyanide Plant, El Dorado County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by PROF. E. F. GROPELLO.

At the Taylor mine the ore is composed of highly oxidized iron pyrites which have been accumulating for years as a product of the concentrating plants of a 40-stamp mill, but too low in value to be either shipped to the smelters or chlorination works. The analysis shows: Iron pyrites and sand, 97%; copper, arsenic, antimony, 3%. Many ways have been tried during the last few years to work these concentrates by cyanide in its various methods of application, but proved unsuccessful.

GENERAL VIEW OF CYANIDE PLANT AT TAYLOR MINE, EL DORADO COUNTY, CAL.

Difficulties of different characters were the cause of previous failures. First: The very high consumption of cyanide. Second: The quick fouling of the solutions. Third: The undue consumption of zinc. Fourth: The unsatisfactory precipitation of the gold from its solution. All of these causes resulted in an unsatisfactory extraction of the value and a high cost of treatment. The causes and remedies of the various difficulties having been carefully studied and experimented with by the writer, the following plant and method of treatment was at last concluded upon and gave satisfactory results.

The plant consists of twenty leaching tanks 20 feet in diameter and 2 feet deep, a false bottom and two discharge doors being provided for each tank; three sump tanks respectively 16 feet, 9 feet and 7 feet in diameter and 3 feet deep; three solution tanks, respectively 10 feet, 8 feet and 6 feet deep and 8 feet in diameter; five zinc boxes 12 feet long and 18 inches deep.

The plant is also provided with a No. 2 centrifugal pump and a pulverizer.

The leaching tanks are made of No. 20 galvanized iron, riveted and soldered, and painted inside.

The solution and sump tanks are made of No. 22 galvanized iron, riveted, soldered and painted as above.

The galvanized iron, which, I believe, has found here for the first time its employment in the construction of cyanide tanks, is a very suitable material, being light, easily worked, and cheap as compared with ordinary steel, iron or wooden tanks.

The concentrates are in a pile, above the plant. Having stood for years exposed to the oxidizing power of atmospheric agencies a high decomposition took place, causing them to cake in hard iron lumps which were found impervious to the cyanide solution.

A cheap method of pulverizing the sulphurets had to be resorted to as they carried too much moisture to allow the use of rolls.

A cylinder consisting of two opposite steel plates, 30 inches in diameter, connected with two rows of steel bars, 12 inches long, so as to form a round cylindrical cage, with an end central feeder, has proven when driven at 600 revolutions a minute a very satisfactory pulverizer to cheaply get the material to the desired condition.

The concentrates are taken with an ordinary mining car from the pile to the pulverizer, the right amount of lime being fed into the pulverizer in connection with the charge so as to neutralize the acidity: as much as 600 pounds of lime to a charge of about twenty tons being sometimes necessary.

The pulverizer, by way of a discharge door, fills a car below, which is then dumped into the tank. The tank once filled water is allowed to percolate from the bottom till the charge is covered.

The water is then allowed to stand on the pulp for about three hours so as to permit a complete soaking of the mass. This time expired, percolation is commenced through the bottom discharge pipe, new water being allowed on top. Two or three days are needed to wash out all the soluble iron salts and neutralize the acid, the pulp losing at times as much as 13% of its weight during the preliminary treatment.

The charge being washed thoroughly and giving a decided alkaline reaction is then allowed to drain, vacuum being applied to assist percolation. At the end of the operation the pulp is about 14 inches deep. It is then shoveled over in the tank, using big square shovels, so as to bring the bottom in contact with the air, oxidizing the ferrous hydrates formed during the alkaline wash into the corresponding ferric salt practically unattacked by cyanide.

This done the first cyanide solution (.05 of KCy to the ton) is applied and allowed to stand on the pulp for about twenty-four hours, after which a very slow percolation is started, through a special set of boxes, sump and solution tanks.

The first solution proves to be full of impurities and often shows the presence of alkaline sulphides. These are eliminated by the use of soluble lead salt. Iron salts of complex and variable composition are also found, but the excess of lime mixed with the pulp in the presence of such a small amount of KCy, slowly precipitates the iron salts, some of which, being carried by the solution into the settling tank, are seen to quickly change into ferric hydrates and settle to the bottom. Thus the KCy which had been rendered inert by the solution of the iron is partially regenerated. The solution, being cleaned of all objectionable impurities, is then turned into the main zinc boxes, sump and solution tanks.

This treatment takes from three to four days. After the third day of treatment, if the charge does not show an even percolation or extraction (four samples each of a different section of the tank being taken and assayed), the pulp is shoveled over again in the way already mentioned.

This done, a solution of .10% of KCy to the ton is allowed to percolate through the charge for about fourteen days, when the extraction falls down to such a small amount that it reaches the limit of profitable working.

The pulp is then washed and sluiced out, the tank being ready for a second charge. The addition of small quantities of Na_2O_2 during the percolation has proved to notably increase the extraction. Owing to the high decomposition of the concentrates and a great amount of sewerage matter settled through them, coming from a stable above the pile, a very heavy foam sometimes arises in the zinc boxes, causing a quick consumption of zinc and very imperfect precipitation. This action is stopped by adding on top of the charge pulverized quicklime, which in time will clear the solution of the organic matter.

A very unusual phenomenon appears as soon as the solution is over $1.50 in value to the ton, and over .10% strong in KCy. When this point is reached a quick dissolution of the zinc with a great evolution of hydrogen takes place; but if the value of the solution falls to less than $1.25 to the ton, no such phenomenon appears, even if the strength of the solution is brought up to .25% of KCy to the ton. This point is characterized by a very good precipitation in connection with a small consumption of zinc.

Alkaline sulphides form continuously during the percolation period. To free the solution from this obnoxious salt two ways are employed.

By strengthening the solution to over .10% of KCy to the ton a quick dissolution of the zinc is caused, the zinc eliminating the sulphides; but if the sulphides are formed in such quantity as to require a too great quantity of zinc a soluble lead salt is used.

The chemists must be extremely cautious so as to see that zinc and sulphides are kept in the right balance in the solutions as both are useful, the sulphides to prevent a fouling of the solution by zinc and other metals, the zinc to limit the excess of sulphides. By carefully following the method above described, the writer succeeded in having his solution, after treatment of over 1100 tons of concentrates, quite as active in dissolution of gold as when first used fresh.

During the course of the treatment, having once purposely omitted putting fresh zinc shavings in one of the boxes, after several days I noticed that the completely coated zinc not only was inactive as a gold precipitator but gold already caught in the boxes would slowly get into solution again, so as to bring the solution which assayed $1.10 a ton entering the boxes to over $6.00 when leaving them. I attributed this phenomenon to the fact of having steel, iron, antimony and arsenic in the solution, which metals would naturally act toward copper, gold and silver as zinc does toward them, precipitating iron, antimony and arsenic by a simple interchange. Of course, to reach this point no free zinc must be available in the boxes.

TAILINGS PILE AND DISINTEGRATOR, TAYLOR MINE, EL DORADO COUNTY, CAL.

California State Miners' Association.

The California State Miners' Association began its eighth annual convention at Golden Gate Hall, San Francisco, Cal., on the 23rd inst. The committee on credentials announced that 572 delegates were entitled to seats. The delegates were welcomed by the Mayor of the city. Lieut.-Governor Neff, the president of the Association from its first organization, made the following address:

Gentlemen of the State Mining Convention: When, in November, 1891, a few pretty well discouraged ex-hydraulic miners met at Auburn, Placer county, to consider some plan by which to call the attention of the people of California to the condition of their industry, and to appeal to them for assistance in its rehabilitation, it was with a sort of "last hope" spirit. They had been, so to speak, the "under dog" for years. The Government, the State, the counties, the courts, the people and the press had been against them and the further prosecution of their work. Their mines had been forcibly closed, and the ditches, reservoirs, pipe lines and plants were as useless as the gravel claims, worse than valueless, and idle like the men themselves. Millions of dollars were tied up in the investments, and hundreds of millions locked up in the untouched deep gravels throughout the hydraulic mining counties. With vigorous, active and wealthy antagonists, held high in public favor, it seemed—and was—a gigantic task to attempt a partial reversal or even gain the ear of those who might render assistance to the impoverished miners of the mountains.

They had enemies even among themselves—men who were surreptitiously conducting operations which were under the ban of the law, and thus still further aggravating to renewed opposition those who felt that their rights were being infringed.

Those miners at Auburn were only a few of that numerous band that had been fighting their cause for years, with antagonism on all sides, finally to meet disaster and apparently permanent defeat in the courts. Even the suggestion of an attempt at renewal of operations was met with a howl of opposition.

But these miners of Auburn builded better than they knew. They were destined to set the cornerstone and lay the foundation of an institution which not only threw its protecting ægis over them, but over those engaged in all branches of the mining industry. It was destined to bring within its lines so vast a number of earnest men of kindred pursuits, that their requests demanded attention, and could not be ignored by people, State or nation. The merchant, the manufacturer, the lawyer and the statesman gave their moral, professional and financial aid to again put upon a proper basis the industry which had caused the settlement of the Golden State of California, and had built it up to its proud position among its sister States.

All this resulted from the quiet, almost retiring, little meeting in Placer county, where a very few of the many still had a stray gleam of hope to lead them on. Almost with fear and trembling, they prepared and issued an address to the people of the State, setting forth their condition and appealing for popular and legislative aid. It was modest; it was just; it conceded the rights of others. Far from being aggressive in any way, it so plainly and conservatively stated the miner's case that it received immediate attention—the first time this had been the case for years. The wording of this address had much to do with what was subsequently accomplished.

With this address was issued also a call to all the miners in California to meet in convention in San Francisco, and the valley men and farmers were also invited to take part in the deliberations. Among other acts of that convention was the formation of this organization—the Miners' Association.

The very moment that convention met and commenced its deliberations began also a change of sentiment on the part of the people and the press. It was seen that the convention was a conservative body asking for justice—the legal authority to work their property only where this could be done without injury to any other interests. The means of doing this were pointed out, and the people and the press lent their assistance. All the public bodies of this and other cities of the State officially endorsed the miners' plans, and the Legislature adopted a memorial to Congress which induced that body to lend a willing ear.

In the end a measure was passed by which the great hydraulic mining industry of the State came under Federal protection, and gradually mine after mine was legally started up, until now several hundred are in operation that were at that time closed down.

It is true, the work is restricted so that the output is smaller than formerly, but this was to be expected under the circumstances, though no one's rights are now infringed, so we can have no cause of complaint on that score.

With the passage of this measure reopening the hydraulic mines of the State the active work of the California Miners' Association with this particular feature was, for the time, ended the Government having taken the protection of these mines into its own hands. But before that period it became apparent that the mining industry needed many reforms in other directions, and it became our duty to attend to these. Some persons, however, still labor under the misapprehension that this is purely a hydraulic miners' association, and that little attention is paid to other industries. Nothing could be further from the truth. The most crying need at the time of our organization was the reopening of the hydraulic mines; but, that once accomplished, the other branches of the mining industry have constantly received earnest attention. Even at the time of the issuance of the call for the first convention, attention was called to the unjust rulings of the Land Department against the miner, and to the encroachments of corporations on the public mineral lands.

Among its other work this Association has secured appropriations from State and Federal Governments in aid of the mining industry; has secured the passage of several favorabl · Acts by the State Legislature; has assisted materially in several mining exhibitions; worked with the Transmissisippi and Mining Congresses; caused the Land Department of the Government to act more favorably toward the mining interests; brought forcibly to the attention of Congress the encroachments of corporations on the public mineral domain, so that this will shortly be stopped; inaugurated the movement for the conservation of water in California, and that looking to the appointment of a Cabinet officer with a Department of Mines and Mining; helped revise certain State laws; and, perhaps more than all, has created and fostered a public sentiment favorable to the mining industry of California and to the miners themselves.

All these matters appear easy to enumerate, but they have not been easy of accomplishment. It has taken earnest thought, serious discussion and hard work to get successful results from any of them. Several matters are still pend.ng to which we have given our attention for many months and which must occupy us still further. In fact, all of our permanent committees have work in hand of the utmost importance, as you will learn from the reports of the respective chairmen.

The brief reminiscence in which I have indulged should have contained the names of many men who have been identified closely with our Association and who have labored late and early in our cause, but they are so many in number that I cannot even attempt to mention them.

I can scarcely believe that there has ever before been an association of mere voluntary membership, a large portion of which is only indirectly interested in the results sought, where there has been so large a number of persons who have been willing to give their time and thought for the good of all, without compensation of any kind. To this day no man in any office of this Association, or otherwise connected with it, has ever received a cent for his services. Have we needed legal advice or active service from our good friends, the attorneys, it has been freely and cordially given and we have never received a single bill. Can any other association of the magnitude of this and with such necessity for legal advice, show such a record for its lawyer members? There is never a meeting of the Executive Committee but what we need their services, but they are always freely given, with no thought or expectation of fees. All honor to the brethren of the bar, say I, as they deserve our hearty and sincere thanks.

The merchants, manufacturers and citizens generally have been more than generous with their contributions, and the funds thus donated have enabled us to fight our battles in a manner that could not have been accomplished with the funds from the mere membership dues. These funds have always been contributed generously and freely.

In fact, to the money thus donated not only are we indebted for what we have been able to do, but actually for our prosperous existence to-day. It is but just to mention this, since these gentlemen's names are more prominent on our subscription lists than among our lists of officers and committees.

To the press of this city and of the entire State we are also indebted for many favors. It has very fairly reported our proceedings at all times and has promptly called attention to any of our measures before the Legislature and Congress, generally approving and urging their adoption. In fact, ever since the organization of this Association the press of California has taken a lively interest in the miners' movement, and has done everything it could to enhance and benefit the mining industry. As to individuals who have given us assistance, mere mention of their names is impossible in the time at disposal.

There are several matters which the members of this convention must earnestly consider and by their resolutions indicate the course the miners of the State should pursue. You are the representatives of a hard-working and busy class of men who cannot give attention to the details of all these matters, and they look to this body in a great measure for guidance.

In the first place we should continue to urge before Congress the so-called Mineral Lands bill, upon which we have already expended so much labor. In the face of the bitter opposition of those who are benefiting by the present condition of affairs, and the adverse influence in high official quarters, we have already accomplished much. It was with difficulty we could at first obtain even a hearing in Congress on this subject, but finally only a technical point prevented the passage of the bill. It is highly probable that this pending measure will pass the next time it is considered by Congress, but we must spare no efforts to see that it does. Week by week, month by month, year by year, sees the domain of the prospector narrowed, contracted and lessened in space, throughout the mining States by the present policy of the great corporations who are claiming—and taking—what the law never gave them and never intended to give.

Even while the question is pending, thousands and thousands of acres of mineral lands are passing by railroad title into hands which compel the miner to pay for what the Government expressly saved for him to open and develop without cost.

We must redouble our efforts, hold on to what we have gained and earn for ourselves the thanks of the mining community for saving its heritage intact. Congress will do the right thing when the facts are properly presented. It is for us to make this presentation of facts and obtain that justice which is the pride of the American citizen.

Then we want that Department of Mines and Mining and that Secretary of Mines in the Cabinet of the Nation. Why last year the miners of this country dug out of the ground mineral products of the value of over seven hundred millions of dollars, and that was over sixty millions more than in the previous year. Why should not an industry with such a growing substantial record have some representative in the councils of the Nation? Talk about the need of protecting our industries! Here is one of great magnitude absolutely unprotected. It is unprotected, I say, from the assaults of the great railroad corporations; from the sinister attacks of officials in the Departments; from the very ignorance of Congress itself. Whatever attack may be made upon it in the shape of unwise laws and adverse legislation, there is now no man to say Nay. There is no one to advise the President on the subject, and it is an industry which is scarcely recognized in Government councils.

The systems of obtaining titles to mineral lands, of patenting them, of representing them annually, are confusing, unsatisfactory and far behind those of other countries and behind the age. The confusion existing in the State and national mining laws are such that it is hard to settle principles even with learned judges, able advocates and skilled experts. The Land Department overturns the judgments of the lower courts and even the Acts of Congress themselves, and these backed up by so-called decisions of Secretaries of the Interior stand for years as law until overturned by accidental cases submitted to judicial determination.

Why should we not have a Secretary of Mines and Mining to pass upon and adjudicate these matters relating to mineral lands instead of a Land Commissioner and Secretary of the Interior with so much on their hands that they scarcely have time to find out what a mine is, much less what the miners need? Why should some man who is from an agricultural community, with his sympathies and experiences all in that direction, sit in judgment on the property interests of the vast number of hardy men who are digging their living from rugged mountains of the western side of this continent? And they dig this seven hundred millions yearly in the face of adverse legislation; in the face of active opposition and passive ignorance; in the face of antagonistic practices and customs, with no one to present their case in the tribunals of the Nation. Let us have a Secretary of Mines and Mining, we say! Let the machinery of passing on and giving title to mineral lands be taken from the pres·nt pigeon holes, and let a Department which understands mines and mining take hold of mines and mining!

We want relief from the present burdensome system, and we want it badly and quickly. We must keep constantly agitating this subject, and our brother miners in all the other States will back us up. These are national matters on which I have thus far spoken. But here at home in our own fair State, where most of our work lies, we have important problems to help solve. It was this Association which first suggested that some general plan be urged for the conservation of water, aside from that in vogue among the private mining and ditch companies. Their experience has shown what can be done by individuals, but vastly more can be accomplished by public assistance and the adoption of a general system. The experience of the past two years has shown what a vital necessity this is for the general welfare of the producing classes, the miner, farmer and manufacturer. Even in the "dry" years there is plenty of water in the high mountain regions could it but be conserved for use during the rainless months. The climatic features peculiar to this State require that the people unite in carrying out some thorough system which will enable us to control the flood waters and not allow them to pass off as useless, when we so badly need them later on.

During the past summer and the previous one, mines and mills have suffered an enforced idleness and hundreds of miners have been thrown out of work simply because scant provision had been made to hold back the waters from the melting snows. And this condition of affairs must be frequently repeated until a remedy is applied. There are plenty of immense reservoir sites in our magnificent mountains and there is plenty of water. Nature has provided us with both but man must do his share if he expects to get the benefit. It is our duty to co-operate in this movement in every way, both as an association and as individuals. The mere adoption of resolutions on this or any other subject accomplishes little unless backed up by hard work and hard coin. Resolutions will not build dams but work and money will. This is the most important problem the miners of this State have yet to solve. It is true some of our mining and ditch companies have built some of the largest ditch and reservoir systems in the world, but this work has only commenced as compared with what has yet to be done.

And now another thing, and one of no small importance either. It is evident that this Association has got to go back to first principles and take up the fight of the hydraulic miners again. And we have got to take it up vigorously, too. The Caminetti law, for which we all fought so hard and which has accomplished so much, is in danger, and with it the whole hydraulic mining industry of California once more. Our old opponents, who never were very well satisfied with the debris question being taken out of local hands and placed in those of the Government, want again to be in a position to have something to say in this matter. Their old weapon, the injunction, has been brought out and put into the hands of the men who formerly wielded it so disastrously and with such dire effect.

This time it is to be used, not only on the miner, but on the very Government itself. Not only do they question the right of the hydraulic miner to mine, but they question the Government's power to give him the right to do so, even under the manifold restrictions of the law especially provided by Congress for the purpose. It had been supposed when the Government Commission of Engineers, appointed by the President of the United States for this object, granted a miner a license to hydraulic, after stipulating the circumstances under which he could do this, and supervising and inspecting his impounding works, that this particular miner was free from further molestation, unless the commission itself saw fit to alter its views upon his infringing any of its rules.

It seems, however, that some zealous opponents of ours take an entirely different view, in the hope, possibly, of a return to the old system, with all its many evils, except to the few who found a way to benefit themselves in some mysterious manner. At all events, they are trying by legal process to close down several mines, which are now and have been operating under Government license and Government inspection, and upon which the required impounding works have been placed by permission of and under supervision of the California Debris Commission.

This, in effect, is a blow at the very principle of the whole system under which we are at present working. It attacks the constitutionality of the Caminetti Act, by questioning the right of the commission appointed under that Act to grant a license for mining by the hydraulic method.

Now this is a matter which the Association has got to fight whether it wants to or not. Understand me clearly, however. In my opinion it is not our duty to take up the litigation of every mine or miner thus attacked. It is not our province to fight every individual battle. But it is our duty and province to defend the Caminetti Act, for which we stand sponsor, and to see that its principles are upheld and its constitutionality confirmed. Beyond this we, as an Association, cannot well go. If, by judicial determination, it is unhappily found that the Caminetti Act is not constitutional, then we must ask Congress to give us a measure to the same end which will stand the test of the courts. These hydraulic mines have got to be worked, and they will be in some way, whether under the Caminetti or some other law. We do not want to injure anybody's interests or infringe upon anybody's rights. We have proven by several years' experience that it is possible to work these mines without material injury to any man, any river or any land. And this once having been proven, the few enemies of the hydraulic mining industry might as well understand at once that the nation, the State and the people will stand by the miners and let no small coterie of persons seeking for self-aggrandizement interfere with them in any way whatever.

We have got to back up with our influence, our attorneys, and our money the men who are making a fight for the validity of the Caminetti Act. But we have not got to take up all the individual suits. We must concentrate our efforts on a test case, probably the Red Dog suit, as this seems to be the initial one, and our attorneys advise its defense as the one which will settle the question for all the others, just as the old North Bloomfield suit settled the other famous one—and settled us. This is my individual opinion, but we have plenty of skilled attorneys to advise us properly in this matter.

It is proper that I, as your presiding officer, should say a word in behalf of those who have assisted me in conducting your affairs.

My young colleague, Mr. Ralston, who none of us will ever get over calling "Billy," even after he gets bald and gray, has ably filled the office to which you elected him, and has done whatever has come to him with the energy and activity which is his habit.

Mr. E. H. Benjamin has made an active and energetic secretary, and performed even more than the duties of his office. The work alone of "stirring up" the different contributors who wrote the articles for the souvenir book for the American Institute Mining Engineers and of arranging for the entertainment of that body while in this State was enough work for one man to do in a year, without anything else. Mr. Benjamin deserves the hearty thanks of the Association, and I want to remind you that all of his services have been performed without the slightest compensation.

Mr. Hendy has served us satisfactorily as treasurer, also without compensation, and has kept our accounts properly and in good shape.

On behalf of the Association I want to publicly express gratitude to the chairmen of the respective standing committees for the work they have performed. They are: Mr. A. H. Ricketts, chairman of the Committee on Mineral Lands; Mr. B. N. Shoecraft, Committee on Mineral Exhibit to Paris; Mr. A. Caminetti, Committee on Dams; Mr. Tirey L. Ford, Committee on Department of Mines and Mining; Judge John F. Davis, Committee on Legislation; Andrew Carrigan, Committee on Finance; John M. Wright, Committee on Jetties and Dredging; and J. M. Gleaves, Committee on Conservation of Water. As you all know, the chairmen usually have to do most of the work, and the rule has not failed this time. In the case of several of these committees there has been a great deal of hard work and it has not been shirked or postponed, I am happy to say.

The members of the Executive Committee have had frequent meetings in order to conduct the regular business of the Association according to custom. Generally speaking, these meetings have been well attended and the members have carefully considered all matters coming before them.

This is the last convention in which I shall occupy the chair, which I have filled, through your courtesy, ever since the organization of the California Miners' Association. Nominally, I have had the direction of the affairs of the Association for some years past, but, while I have had many excellent advisers, this is really the first time I have ever been allowed to have my own way. I mean when I am at last permitted to retire to the ranks so that some younger and more active man may preside over your deliberations. I am afraid it would take too many words to adequately express to you all the kindly sentiments I feel toward you, or the thanks I have deep in my heart for the consideration and help you have given me during my terms of office. Like most of the rest of the members of this Association, I have been connected with the mining industry for a great many years. My feelings and sympathies are all for the miners and their work, for I am one of them myself, though my actual work with the pick and shovel is done. I feel, too, that I ought to thank you gentlemen on behalf of my own county for your extreme courtesy in permitting old Placer to have one of her representatives so long as your presiding officer, when there are so many other mining counties with so very many able delegates.

The future of this organization is one of hope and of usefulness. There is much for us all to do, and more will come before us. As far as my experience has shown, I feel certain that the right man will come to the front when we need special services. There are plenty of able men among our members and they all cheerfully "stand in" with whatever work is to be done.

It but remains for me to again thank you for all your courtesies to me.

Reports from various standing committees were heard and a committee on resolutions was appointed by the chairman. For the first time in the history of the Association the committees had upon them representatives from other States. The Committee on Resolutions was composed of twenty-nine men, among which were representatives from Nevada, Washington, Oregon, Montana, New Mexico and Colorado. Telegraphic greetings were received from official representatives of the American Institute of Mining Engineers, which held its seventy-sixth meeting in San Francisco in September.

Reports of officers and committees were heard on the morning of the second day. The secretary's report showed that the expenditures aggregated $15,-610 94, and that there was a present balance of $3,-706.33. U. S. Senator Perkins addressed the convention, pledging the entire California congressional delegation in continued effort in all matters looking to general aid, and suggesting that the miners give expression to their desires in that regard. Ex-Congressman Pence of Colorado gave some practical advice as to how a Secretary of Mines and Mining could be secured. Congressman de Vries of the Second Congressional district followed.

A committee was appointed on revision of the Association's constitution and by-laws.

The Committee on Legislation reported that the immediate interest of the Association in legislation is a demand for the rehabilitation of hydraulic mining, the segregation of mineral from agricultural lands in railroad land grants, the creation of a Department of Mines and Mining, and the conservation of mountain waters.

The Committee on Mineral Lands reported that owing to the failure of Congress to pass the bill no progress had been made.

The Committee on Jetties and Dredging reported that the work of the committee was subject to the work of erecting dams, as provided for by Federal and State appropriations, which subject would be covered by the report of the Committee on Dams.

The Committee on Resolutions made report as follows:

WHEREAS, The California Miners' Association was organized primarily for the purpose of devising a method whereby the great industry of hydraulic mining, which has in the past added hundreds of millions of dollars to the permanent wealth of the State, could be resumed without injury to agricultural and other interests; and

Whereas, The Act of Congress of 1893, known as the Caminetti Act, in the opinion of this Association is a just law and provides a perfect system of impounding debris and a full protection of all interests involved; therefore

Resolved, That the California Miners' Association stands by the

existing United States law regulating hydraulic mining in California, and hereby pledges its continued, hearty and unfaltering support to the upholding of the said law.

Resolved, That we appreciate highly the efforts made by the National Congress and the Legislature of this State to secure the passage by each of those bodies of that measure known as the California Mineral Lands bill; that we earnestly urge upon the Congress of the United States that such efforts may be continued at its coming session, to the end that the California Mineral Lands bill may become the law of the land, and be the means of preventing the further absorption by corporate interests of an area of land of great value to the prospector and the miner; that we do hereby respectfully urge upon the Speaker of the House of Representatives of the United States and the House Committee on Rules that a day be set for the consideration of this bill at the coming session of Congress.

WHEREAS, The establishment of a national executive Department of Mines and Mining is a matter of grave concern to the mining industry of the United States; and

Whereas, United effort upon the part of the friends of the mining industry throughout the country is necessary to the permanent procurement of the necessary legislation by Congress in that behalf; and

Whereas, The miners of Colorado, through the press of that State, have requested the Governor of Colorado to call a convention of miners from the several mining States of the Union, to be held at the City of Denver, for the purpose of organizing and carrying into effect a concerted plan of action in behalf of such Department of Mines and Mining; therefore, be it

Resolved, That the California Miners' Association, in annual convention assembled, does hereby cordially endorse the calling of such a convention, and that the Association further expresses the hope that such convention may be called at a reasonably early day.

Resolved, Further, that the Secretary of this Association immediately communicate these sentiments to His Excellency, the Governor of Colorado, with the assurance that this Association is at all times ready and willing to do whatever it properly may in relation to the matter referred to in the foregoing resolution.

WHEREAS, The mining industry of the United States, with an output of nearly a thousand millions per annum, has assumed such vast proportions as to demand at the hands of the National Government such care as cannot be given to it by the several States in their separate and independent fields of action, therefore,

Resolved, That it is the duty of this Association to use all legitimate means at its command to secure the creation and establishment of a National Executive Department of Mines and Mining, with a Secretary at its head, who shall be a member of the President's cabinet.

Resolved, That the California State Miners' Association again directs public attention to the necessity for a concerted movement toward the proper conservation of the waters of the State, and is in hearty accord with any effort looking to that end; that it tenders its assistance and support to the federated organizations meeting to consider that important matter on the 14th prox., and desires to cordially co-operate, that storage of water may be adequately secured throughout California. The California Miners' Association started this movement one year ago, and gladly affiliates for this purpose with any and all practical movements toward advance in a subject of such surpassing importance to the entire State and every industry therein.

Resolved, We favor the preservation and development of our natural resources by the construction of storage reservoirs by the Federal Government for flood protection and to save for use in aid of navigation and irrigation the flood waters which now run to waste and cause overflow and destruction, as recommended in the report of Colonel Hiram M. Chittenden, and we urge the adoption of the recommendations of this report as to the construction of storage reservoirs in the arid regions as a part of the national policy of internal improvements.

WHEREAS, Although in the opinion of this Association the State Mining Law of 1897 was repealed, yet in order to remove any uncertainty upon the subject among the miners of this State,

Resolved, That the Committee on Legislation is hereby instructed to prepare a bill for presentation to the Legislature at its next session repealing in clear and explicit terms the Mining Act of 1897.

Resolved, That the Legislative Committee of the Miners' Association of California is hereby instructed at the next session of the Legislature of said State, to secure the passage of an Act amendatory of an Act of the Legislature of said State, approved March 29th, 1872, which shall be in substance as follows:

SEC. 1. Every person who shall feloniously steal, take and carry away, or attempt to take, steal and carry away from any quartz, placer or other mine or mining claim, or from the dump or dumps or ore bins thereof, tunnel, sluice, undercurrent, riffle box, sulphuret machine, quartz mill, smelter, or any other works for the reduction of gold-bearing ore, earth or quartz, any gold dust, amalgam, quicksilver, or gold-bearing ore, earth or quartz, the property of another, shall be deemed guilty of grand larceny, and on conviction thereof shall be punished by imprisonment in the State prison for any term of not less than one year nor more than fourteen years.

SEC. 2. This Act shall be in force from and after its passage.

Resolved, That we respectfully request action by Congress on the subject of opening Pyramid Lake and Walker Lake Indian reservations (Nevada), situated in the mineral regions, for the purpose of permitting, under such rules and regulations as the Department of the Interior may prescribe, prospecting for minerals therein, and the holding and patenting of claims.

Resolved, That the Legislative Committee to be appointed at this session of the California Miners' Association be and are hereby instructed to prepare and report to the next annual meeting of this Association the draft of a bill to be presented to the Legislature of this State, making mandatory a record of all mining claims within this State.

WHEREAS, Many of the States of the Union have enacted laws relating to locating, holding and working mining claims on the public lands of the United States, and have prescribed various conditions and regulations as necessary thereto, which are not included in or provided for by the laws of the United States; and,

Whereas, These local laws and regulations differ in the different States and thereby cause much confusion and uncertainty; and,

Whereas, It is desirable that there be one uniform system of mining laws throughout all the States; now, therefore, be it

Resolved, First—That it is the sense of this convention that one complete and uniform system of laws, rules and regulations relating to locating, working and holding mining claims on public lands of the United States should be provided for by the National Government.

Second, That the Congress of the United States be petitioned to take such steps in the matter as will secure the above desired result.

Resolved, That with a view to adding interest and value to the annual meetings and reports of this Association, the President is directed to obtain from members of the Association specially qualified therefor, at each annual meeting thereof, at least three papers upon scientific and practical subjects of interest to the mining industry, which papers shall be read in full or by title before the Association, and shall be published in the proceedings of the Association.

Resolved, That this Association holds itself greatly indebted to the public press of San Francisco and the mining counties for the assistance it has given not only to the Association, but to the mining industry of California during the past year.

Resolved, That this Association is under deep obligations to the merchants, manufacturers and business men of San Francisco for their generous financial aid during the past and previous years, and recognizes the fact that without this special assistance it would have been unable to accomplish one-half of what has been done. The Association is free to acknowledge this, since the largest proportion of the funds received has come from these gentlemen, who are only indirectly interested in the mining industry.

The Committee on Dams and Debris made the following report:

Since the adjournment of the convention of 1898 considerable progress has been made by the various officials whose duties involve action under the mining bill of 1893, providing for the building of restraining barriers and the resumption of hydraulic mining.

Your committee has had the valuable assistance of the work and experience of Hon. Marion De Vries of the Second Congressional District, who has submitted a statement from which we deduce the following facts: That there is available, of the appropriations made by Congress and by the State of California, the sum of $500,000 for the construction of restraining dams, and to be used in such other modes as the Debris Commission may deem expedient in impounding the debris from the mines; and Congress has also provided that the Secretary of War may let contracts for the work, but that one-half of the contract price should be paid by the State of California.

This provision applies to all appropriations that have been made as well as all those that hereafter may be made.

The Secretary of War is also authorized to carry out the provisions of any Act of Congress providing for the restraining or impounding of mining debris in California, and may in his discretion, when the aggregate of appropriations made by the State of California and by Congress, and available therefor, is sufficient to complete the same, undertake the work thereto, by day labor and by purchase of supplies and material therefor, and may accept payment on account thereof as the work progresses under and according to the provisions of the Acts of the Legislature of the State of California for such purposes.

If these works are constructed by day labor under contract, this eliminates the element of risk from the cost of construction, which would be figured by every contractor in making bids upon the same by entirety, which has been estimated at about 25%.

In view of the possibility of the future construction of a dredger by the State of California, to be used in any case when applicable, or the construction of other machinery or appliances by the State, for similar works, it was deemed prudent that the Federal Government be empowered to accept the use of such State property where desirable. The Judge Advocate General of the United States Army having rendered a decision that before the Federal Government could accept the use of State property in any of its works, the following provision to that end was enacted by the last Congress:

"The Secretary of War is hereby authorized to accept from the State of California the use of any dredger or appliances owned or controlled by said State conformably to any offer thereof made by said State; and the Secretary of War is hereby authorized to use any such dredger or appliances in any river or harbor improvements that may be prosecuted therein by the United States, either by part of the United States alone or conjointly with said State; *Provided* that nothing shall be paid to the State of California for the use of said dredger and that nothing herein contained shall create any liability against the United States."

These specific provisions complete to date the legislation necessary to carry into effect the work of the United States engineers and California Debris Commission in relation to restraining dams and impounding works.

The proposed dam at the Narrows, as well as the Reed Creek plan, which were referred to in the last report of this committee, have been abandoned—the former on account of its great cost and the comparatively small capacity for storage of debris, and the latter for reasons not mentioned.

Your committee also waited upon Major Heuer, of the California Debris Commission, from whom was obtained the following gratifying information:

Examinations of sites and plans have been undertaken by said Commission and field work completed.

Report thereon is now in course of preparation and will be submitted to the Chief of Engineers at Washington not later than the 1st day of January, 1900, together with the recommendations of the Commission.

Major Heuer thought that contracts could be let if the plans and recommendations are approved within sixty days after the approval of the report.

As outlined to us, present surveys on the Yuba have demonstrated the existance of suitable sites and the feasibility of plans which will, if the impounding works are constructed in accordance therewith, not only restrain at moderate cost all debris now in the river, but also in unlimited quantities all that will be sent down for at least the next twenty years. This, it is stated, can be done without injury to the navigable waters or lands adjacent to the river.

The importance of the present investigation upon the Yuba must be clearly apparent to all, for if the work should prove successful there, the same plans can be applied to all the tributaries of the Sacramento and San Joaquin river systems, thus enabling the resumption of hydraulic mining throughout the region under the jurisdiction of the California Debris Commission.

Provided other conditions are favorable, we have every reason to believe that the recommendations of the California Debris Commission will be approved, and one of the great perplexing problems which has confronted us for many years will have been solved.

Major Heuer, as one of the California Debris Commission, seems to think that the $500,000 now available for this work will be sufficient to inaugurate and establish the system, to which additions may be made as required from time to time.

In view of the early report of this Commission, it is to be regretted that any action in the courts has been taken by the Anti-Debris Association disputing the right of the Commission to grant permits to mine by the hydraulic process under the Act of 1893, regulating hydraulic mining in California.

This Act was conceived in a spirit of harmony, and its provisions provide for the improvement of navigation facilities in the rivers affected, protection to adjacent lands, and, if hydraulic mining can be carried on without injury thereto, then under regulation it permits the same. Shall the work be abandoned now, after years of trial and experiment, when a solution of the problem appears near at hand?

The most sanguine friend of the rivers and the valley must certainly admit that in all justice, and for the benefit of the mutual interests affected, litigation now pending should be stayed to await the promised report. It will be time then for the Anti-Debris people to proceed if the proposed plans are unsatisfactory to them; but, on the contrary, should it be found that entire and full protection to the river and adjacent lands is the basic principle upon which the impounding works are to be constructed, then the harmony which promised to bless the people of the mines and the valley will be an accomplished fact, and the two sections, proud in the protection afforded to each by a generous Government, will, aiding each other, reach that prosperity which their unparalleled resources unfettered will bring to all.

We recommend that this committee be granted power to meet a committee of the Anti-Debris Association to discuss pending litigation, with a view to avoid a continuance thereof until action is taken by the authorities at Washington on the forthcoming report of the California Debris Commission.

It will be seen from the foregoing that the real, earnest work of this Association is about to commence. If the solution we now believe about to be offered will become an assured fact, the efforts of this Association and of the mining community to resume hydraulic mining under legal control and without injury to any interest, is about to be crowned with success, but as our President said yesterday in his annual address, resolutions are not sufficient; work is necessary—work not only by our officers, our committees, but work by our members, by our people generally, miners as well as farmers; for if this question can be settled right, all are interested—all will be benefited.

We recommend that this committee be given full power to act in the questions committed to its care, subject to the authority of the Executive Committee in the premises. This request is made so that it can be prepared to follow up with proper action the recommendations of the California Debris Commission, if, in its judgment a suitable and favorable plan has been found to impound the debris in our mining streams.

We desire to express our appreciation of the efforts and efficient support of the California delegation in Congress in behalf of the mining interests of this State.

WM. C. RALSTON, OF CALAVERAS COUNTY, CAL.

President California State Miners' Association.

The report was adopted and the closing recommendation was made the subject of a special motion adopting such recommendation.

The Committee on Conservation of Water made report which was adopted. A paper was read by A. H. Ricketts on oil and the law regulating oil lands, and a speech was made by Delegate Maxwell opposing proposed State aid to irrigation and advocating the Federal plan of co-operation.

The Chair appointed a Committee on Revision of Constitution and By-Laws. In the evening a banquet was given by the California delegates to the visiting members from the other States.

The proceedings of the third day—October 25th—began by speeches from Congressman Kahn of San Francisco and Judge Carpenter of Los Angeles. On motion a delegation of 100, to be appointed by the president of the Association, was deputed to attend the convention on the conservation of water, which meets in San Francisco on November 14th.

The paper on "Oil and the Law Regulating Oil Mining," was ordered published in the regular record of the proceedings, and the following resolution was passed:

Resolved, That the president of the Association be authorized to appoint a committee of five on county organization, whose duty it shall be to assist the officers of the Association in organizing branches of this State Association, and stimulating new life and membership in county organizations already existing, actual traveling and living expenses of said committee while in performance of duties above prescribed to be borne by the Association.

In the selection of officers Wm. C. Ralston of Calaveras county was unanimously elected president by acclamation. In the same hearty and enthusiastic way, Fred Zeitler of Nevada county was elected vice-president and E. H. Benjamin of Alameda county and Sam'l J. Hendy of San Francisco county re-elected secretary and treasurer, respectively.

On motion the engrossed resolutions expressive of the esteem of the Association for its retiring president were formally adopted, and J. H. Neff and Julian Sonntag were elected honorary members of the Association.

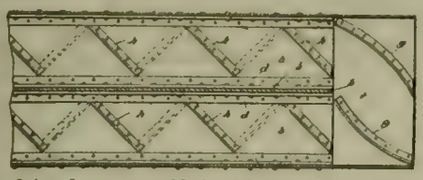
The Lieutenant-Governor of the State, Hon. Jacob Hart Neff, the president of the Association from its inception, then laid down the gavel for the last time, and in a few feeling words of official farewell retired. As he stepped from the chair, the whole convention rose and gave him three hearty cheers.

On motion the convention adjourned sine die.

The Hoosac Tunnel Fan Tested.

The electric fan designed to clear the Hoosac tunnel of smoke did not meet expectations when first tried some time ago, and experiments have since been in progress. Recently the fan was run for four hours at a speed of 110 revolutions per minute and drew smoke in large volumes from the shaft. The volume was reduced at times, showing that the tunnel was practically cleared, and it was easy to tell when a train passed through the tunnel by the increased amount of smoke raised by the fan. The test was very satisfactory, showing that the principle adopted for ventilating the tunnel is correct, and the only question now is whether a greater speed of the fan will be necessary to fully accomplish the desired end. If so, the power will have to to be increased. In making the test 140 H. P. was used. Before making any further changes the fan will be run for a day and the results will be carefully noted. If the test shows more power to be necessary it will be supplied, but there is no longer any doubt that the tunnel is to be effectually ventilated by means of an electric fan.

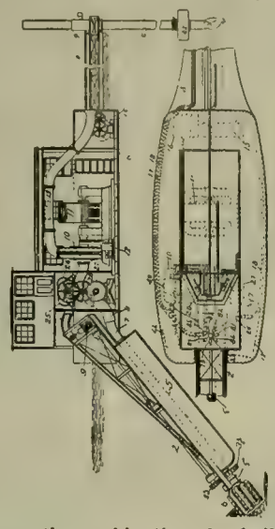
A Direct-Current Power Transmission.



The Compagnie de l'Industrie Electrique has commenced work on the machines for the important St. Maurice–Lausanne power transmission in Switzerland. The line will be sixty-eight kilometers (forty-two miles) long and 10,000 H. P. will be sent over it. Direct current at a maximum pressure of 25,000 volts will be used, the machines generating a constant current at variable voltage; they are, practically, large arc machines.—Electrical Review.

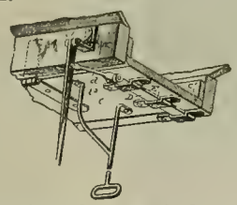
Latest Mining and Metallurgical Patents.

Patents Issued Oct. 17, 1899.



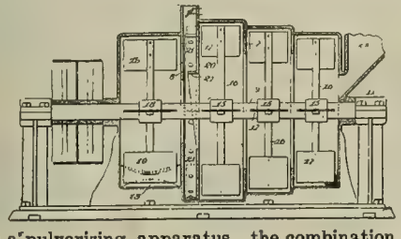
Specially Reported for the MINING AND SCIENTIFIC PRESS.

DRIER.—No. 634,798; J. Bishop, Bartow, and A. P. Jerguson, Hull, Fla.



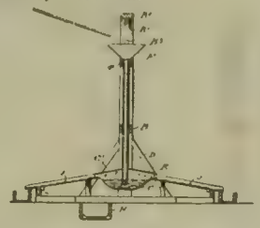
A drier drum provided with a solid continuous diaphragm or partition extending longitudinally through the same to form the drum into a plurality of independent passages, passages extending from the center of the drum to the sides thereof and through which the material to be dried is passed, thereby increasing the effective heating or radiating surface of the drum, and means located at the feed end of the drum for feeding the material to the passages; and spirally disposed passages mounted at the feed end of the drum to advance the stock to the passages in the drum.

DREDGER.—No. 634,865; L. W. Bates, Chicago, Ill.



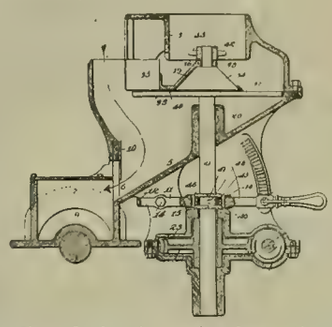
In a dredger, the combination of a hull or boat; a buoyant ladder for carrying the cutting or excavating devices; means for controlling the buoyancy of the ladder; means for effecting the feeding movement of the ladder in the cut; an extension arm projecting rearwardly from the hull or boat; a hollow spud or spuds carried at the outer end of arm, each provided with an air chamber or tank adjustable on the spud; valves and nozzles for operating the spuds and air chambers; electric motors mounted upon the dredger; an electric conductor for supplying current to motors; a buoyant support for cable; and an operating stand upon the dredger, containing devices for directing and controlling the current.

DUMPING CAR.—No. 634,874; R. E. Broyles, Chattanooga, Tenn.



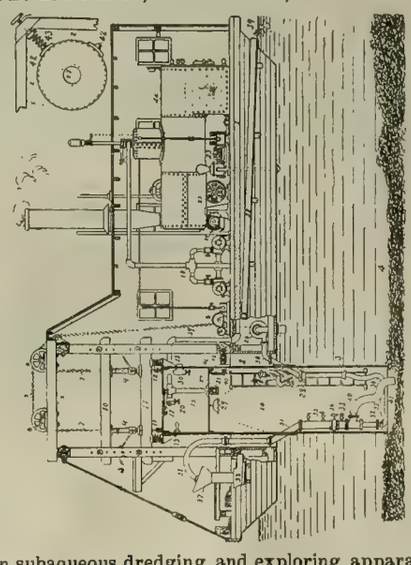
The combination of a car body provided with a hopper, a door hinged at the mouth of the hopper, a sliding bolt, guide straps on the door in which the bolt moves, a locking strap into which the bolt moves, a hand lever hinged to the car body and movable about a pivot parallel with the axis of the hinge of the door, a link jointed to the end of the bolt next to the hinge and jointed to the operating lever between its hinge and its outer end.

PULVERIZER.—No. 635,114; W. M. Wheildon, Boston, Mass.



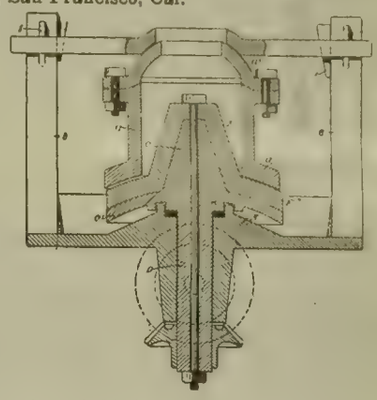
In a pulverizing apparatus, the combination with a series of pulverizing chambers and pulverizers therein, of means for introducing into the pulverizing chambers material to be pulverized and a sufficient quantity of air as to result in perfect pulverization, and means for introducing into the mixture of air and pulverized material an additional supply of air and a single fan for creating both air supplies.

AMALGAMATING APPARATUS.—No. 635,236; H. S. Cope, Melbourne, Victoria.



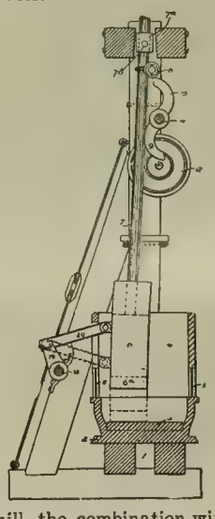
In an amalgamating apparatus and in combination with the frame, a plurality of pipes *A*, arranged vertically in frame, and having their lower ends flanged as described, guide plates *B* and sliding plates *A'* having a limited vertical movement, a chute *K* and a hopper *F*, through which the upper ends of the pipes pass, and into which the pulverized auriferous material and water are adapted to be fed from chute, a mercury-containing receptacle *C* pivotally arranged below pipes, a screw spindle for raising and lowering pipes, riffle tables *J* located one at either side of receptacle and a trough *H* to receive the amalgam.

FEEDING DEVICE FOR PULVERIZERS.—No. 635,112; W. M. Wheildon, Boston, Mass.



In a feeding device for pulverizers, the combination of a feed chamber having an opening therein at the upper end thereof through which material is introduced, a rotatable feed table mounted in chamber and adjustable toward and away from the feed opening therein, means for adjusting table, and a shear adjustable vertically with table but held from rotation, whereby the shear will remove material from table. The combination of a feed chamber, a cylindrical neck in the upper end of feed chamber through which material is introduced, a rotatable table mounted in feed chamber and adjustable toward and away from neck, means for adjusting table, a deflecting cone carried by the table and arranged to enter the neck, and means adjustable with table for removing material from the table.

DREDGING MACHINERY.—No. 635,270; E. A. Rix and P. B. Donahoo, San Francisco, Cal.



In subaqueous dredging and exploring apparatus, a floating pontoon, a wellway therethrough and a pneumatic caisson suspended therein, means to raise and lower the caisson, screw or hydraulic apparatus to force the caisson downward and springs interposed between the hydraulic or screw devices, to maintain an equal pressure around the pontoon, and elastic bearings or abutments between the sides of the pontoon and wellway, so the pontoon may rock or move without disturbing the caisson. In exploring and dredging apparatus, a floating pontoon on which the operating parts are mounted, a double-chambered caisson adapted to be lowered from the pontoon to the bottom of a stream or other waters, in which the pontoon is moored, means to fill the caisson with air under pressure and expel the water therefrom, a spoil pipe extending upward and outward from the bottom of the caisson provided with an inlet or inlets for air that will mingle with the water and spoil that ascend the pipe. An induction nozzle discharging into spoil pipe and a rotary pump forcing water through induction nozzle into spoil pipe. A gallows-frame to support the caisson and means to raise and lower the same.

CRUSHING AND GRINDING MILL.—No. 635,011; J. M. Dyer, San Francisco, Cal.

The object of this invention is to provide a combined crushing and grinding or pulverizing apparatus. It consists in the combination of a central cone having annular extended flanges around the base and an enclosing cylindrical casing having corresponding annular bottom flanges adapted to rest and grind upon the flanges of the central cone, while by an adjustment of the casing with reference to the cone an eccentric movement is effected between the interior of the casing and the exterior of the cone which acts to crush the rock and gradually prepare it before it arrives at the pulverizing surfaces.

STAMP MILL.—No. 634,894; W. H. Lloyd, Colorado Springs, Colo.

In a stamp mill, the combination with a vertically reciprocating stamp head of means connected with the continuously rotating driving shaft for imparting to the stamp head a lateral reciprocating movement between its successive blows, the greater part of lateral reciprocating movement being made while the stamp head is resting on the material in the mortar.

PROCESS OF TREATING ORE.—No. 635,056; D. O'Keefe, Boston, Mass.

The process of treating ore, consisting of roasting the same while being agitated, for the purpose of mechanical disintegration, subjecting the ore to hydrogen gas under pressure, afterward to chlorin gas, and then leaching the same with hot salt water.

PROCESS OF TREATING REFRACTORY SULPHIDE ORES.—No. 635,093; F. Ellershausen, London, Eng.

A process of treating refractory sulphide ores containing lead and zinc which consists in smelting the raw ores, without previous roasting and leaching, in an ordinary blast furnace, and positively drawing off the fumes and gases by means of an exhaust sufficiently powerful to prevent the formation of zinc accretions in the furnace.

Progress in Ore-Reducing Machinery.

Written for the MINING AND SCIENTIFIC PRESS by ALMARIN B. PAUL.

Machinery for the reduction of ores has bothered the minds of men ever since it was known that gold and silver were minutely combined in a hard matrix, but it is only within the past fifty years that the greatest progress has been achieved by way of successful designs, and here it is safe to say that more advancement has been made in the past fifty years than in the preceding 2500.

Stamps were used fifty or more years ago, but the stamps of the past were crude, cumbersome and really unmechanical as compared with those of the present day. Gradually, and as Americans began to handle them, they soon evolved into a more effective machine, and to-day the stamp battery of the mining world is as unlike the battery of fifty years ago as it is possible to conceive, and to Californians largely belongs the credit of this great advance.

As time passes progress in all things comes with it. Time has perfected the stamp battery to such a degree that it seems nothing more can be added. With all this has come also advancement in metallurgy—the manipulation and extraction of the precious metals.

With the stamp battery and its accompanying machinery for the extraction of the precious metals not over 65%, on the average, has been the yield, while with the advance of the solution processes from 85% to 95%, under suitable conditions, is as readily and more economically obtained. The stamp battery performs its crushing part completely, where simply crushing is required, yet for the solution system it produces too much slimy material, which increases the expense per ton of manipulation, as well as reduction. What is demanded for gold and silver ores, and more especially gold, is a plant that produces a uniform product, free from slimes, and by which a more perfect and speedy percolation can be had.

In the effort to gain this higher percentage obtainable by solution processes new economical questions arise, which begin to show that as a profitable machine the stamp battery has reached its cuminating point of usefulness for ores containing gold and silver, and especially for gold, and that a new method of reduction must be adopted for economically gaining the high percentage obtainable which all up-to-date mill men know can be had. The progress of the times in metallurgy demands that at least 90% of the gold values and 80%, if not 85%, of the silver values should be extracted on an economical basis, and this edict is relegating the stamp battery for ores of the precious metals to the past, and upon the simple proposition that it is inapplicable to the economical working of advanced solution systems, to say nothing of the cheapening of machinery and expense of reduction by this method.

The cyanide processes, of which the MacArthur-Forrest is the original, are the advance steps in metallurgy of the present period, and a great advance it is, when we consider the imperfect extraction of gold of even twenty years ago.

The question that calls for consideration in the change of machinery for the extraction of gold is, shall we hold to the stamp or shall we break into the operations of the past and obtain, as we can, a higher percentage of gold values at less expense?

In some sections, notably Australia, this idea of change is largely acted upon, and has proved acceptable by proving profitable.

When we give our thoughts for critically considering the stamp battery we see a cumbersome collection of heavy material, requiring large space for buildings, heavy expense for excavating, erection, etc., above what it should be for the amount of work to be executed.

The coming system not only gives a higher percentage of the metals at a less expense, but the machinery for doing it, where freight, time, excavations, buildings, etc., are considered, will in the majority of instances cost all of one-third, if not one-half, less. This coming system for reduction of gold and silver ores is the use of crushers, rolls and barrels, or, as they are more properly termed, ball mills. All of this class of machinery has been in use separately, as every mill man knows, and they have proved in their separate operations practical and effective.

The newer feature is the combination of the more perfected machinery of this special kind. To make more clear, I will say:

First—Will be a suitable crusher for reducting the ore down to say 1 inch in size.

Second—The use of steel rolls for receiving this 1-inch ore and bringing it down to say ½-inch or coarser, as may be desired, and agreeable to rock being reduced.

Third—The ball mill, for receiving the ore from the rolls and reducing it to any desired fineness, say from 30 mesh (900) wire to 80 mesh (6400), all of uniform grain and free of any amount of slimy material.

This system of reduction is directly in line—in fact, is the most desirable where any base gold or silver ores require the use of furnaces, or where furnace work may be required to better the percentage for any of the solution processes.

When an increase of capacity is desired the plant is simply duplicated. If we look clearly into the science of reduction of heavy ores into atoms, we find the operation of crushers, rolls and ball mills in accordance with what may be considered a natural principle, and without any extra work on a given number of tons.

The stamp, as is shown by the large amount of slimes made, performs in making them at least two-thirds more work than is required for extracting the metals. This extra labor is saved by the ball system, as is also the percentage of metal carried off with the slimes.

The arrangement of this machinery is such that the reduction can be performed either wet or dry, as may be desired. It gives, however, a little higher percentage of work by the wet way. For gold ores to be treated by the cyanide process no system of reduction equals this.

I am aware that taking the position that stamps as applied to gold mining especially will have to give way to another class of reducing machinery is possibly a very unpopular position for me to take, and that to follow in the old rut is far safer for one's reputation, but that is hard for me to do, and this spirit has cost me, no doubt, much discredit in the minds of the conservative miners, but I have the satisfaction of seeing a realization of more than one of my "fancied notions," notably the fine gold losses, about which I preached for over thirty years, and published, spreading broadcast, free, over 10,000 pamphlets. But it is thus we progress. Practical, substantial facts live on. It may take years to eradicate the stamp in gold mining, especially in California, as even cold facts move slow, but time is ever changing and building upward.

Mining in Aspen District, Colorado.

TO THE EDITOR:—The Smuggler mine is hoisting 8000 tons of ore per month, the most of which comes from about the 900-foot level. The workings extend to 1200 feet in depth, but all below the 950 level are under water. To keep the water below the 900 level the Smuggler pumps lift an average of 1250 gallons per minute. There are about nine miles of underground workings and development work goes on at the rate of about 9000 feet per year. The stopes in the mine will average a thickness of 50 feet between walls, and there is one stope which measures 150 feet from hanging wall to foot wall. All the mine work is done by machine drills. The ores are a sulphide, carrying a silver-lead product, though there are shoots which are markedly zinciferous. Ores of the latter character run about eight ounces silver, 6% lead and 17% zinc. At the Smuggler shafts there is a boiler battery of 1060 H. P. and hoisting engines to correspond with it. This company owns and operates two concentration mills. Of the 8000 tons of ore hoisted per month only 2000 tons are shipped direct to the smelters, the bulk of it being concentrated. The old mill is equipped with crushers, jigs and various types of tables and buddles. The last named are to be torn out. The new mill contains crushers, Chilian mills and seventeen Hallett concentration tables. This is locally known as the zinc mill, because all the zinc-silver-lead ores from the mine are handled by it, and its equipment is such as to effect a separation of the zinc material from the galena. All the ore is ground so it will pass through a 60-mesh screen, and then the coarsest of this is reground to 80 mesh. Supt. S. I. Hallett, who is the inventor of the tables bearing his name, states that he uses much less water than is generally used in concentration mills. The Smuggler has for several years paid a dividend of $20,000 per month, but for September a special dividend of $70,000 was paid. The average cost of mining and milling Smuggler ores falls below $1.75 per ton.

The Hunter's Pass M. Co., which is a branch of the New England Exploration Co. of Boston, operate a gold property at the old town of Independence, eighteen miles from Aspen and thirty-five miles from Leadville. The mine is at an altitude of 11,200 feet and has closed down for the winter. In three months this year they mined and milled 6600 tons of ore, from which, it is stated, a saving of 87% was made—being 55% on the amalgamating plates and the balance in concentrates. The values ran from $8 to $10 per ton. Their mill is run by water power. The property is in charge of Supt. H. D. Quinby.

The Percy Con. M. Co., the People's Light & Power Co. and the Castle Creek Tunnel & Power Co., all under the same management, have interests up Castle creek, on the west side of Aspen mountain. A flume two miles long takes water from Castle creek, delivers it to a power house under 190 feet pressure, by which electric power and air compression are developed to furnish light and power and drive drills. A few hundred feet above the power house is the entrance to the Castle creek tunnel, which goes into Aspen mountain about 2500 feet and connects with the tunnel workings of the Durant M. Co., which enter from the opposite side. The ultimate calculations are said to be to erect a concentration mill near this power house.

The Mollie Gibson and Argentum-Juniata—separate properties, but operated under one management—hoist ore from the same shaft and operate jointly a concentration mill of crushers, Huntington grinders and eighteen vanners. About 175 tons per day are being milled, the product being about twenty-five tons per day of silver-lead concentrates. The milling facilities are being increased to make the capacity 200 tons per day. For 1898 the cost of milling the ore was about 85 cents per ton, and it is stated the cost for 1899 will not vary much from that figure. The cost of mining in 1898 was $1.60 per ton, which was a reduction of 67 cents per ton from the 1897 cost. The expense of operating the large pumping plant is borne jointly by the two companies.

During the past year the tonnage output of Aspen district has kept up to the tonnage of the previous year, but it is evident the values per ton of the product have suffered a decline.

The Cowenhoven tunnel, which penetrates Smuggler mountain a distance of two and five-eighth miles, not only drains the mines of that mountain above its level, but is operated as a common carrier of the ores from the Della S., Bushwhacker, Park Regent, Mineral Farm, Alta Regent, Homestead, Pre-emption, Little Deceiver and Badger State, all of which except the last named are worked by lessees. At present from 125 to 150 tons per day are being delivered to the cars through this tunnel. All this ore goes direct to the smelters because its owners have no concentrating facilities. If they had, doubtless the larger proportion of the ore would be milled and a heavier tonnage would be mined.

A CHAMBER IN THE ASPEN MINE, COLO., TIMBERED WITH SQUARE SETS.

The Aspen mine is worked through the Durant tunnel, which strikes westward into Aspen mountain about 3200 feet. An electric winze runs from the tunnel level to the third level, a vertical distance of 650 feet. Above the tunnel there are eleven levels, the ore passing from the stopes between them through chutes to the tunnel level. Herewith is presented a view of the timbering in square sets in one of the stopes. Prior to the smelter troubles last spring this property was shipping about 100 tons per day. At present shipments do not amount to so much. The ores contain a high percentage of lime, which makes them desirable for the smelters and which serves to reduce their treatment charge.

Aspen, Oct. 17th, '99. WASCOTT.

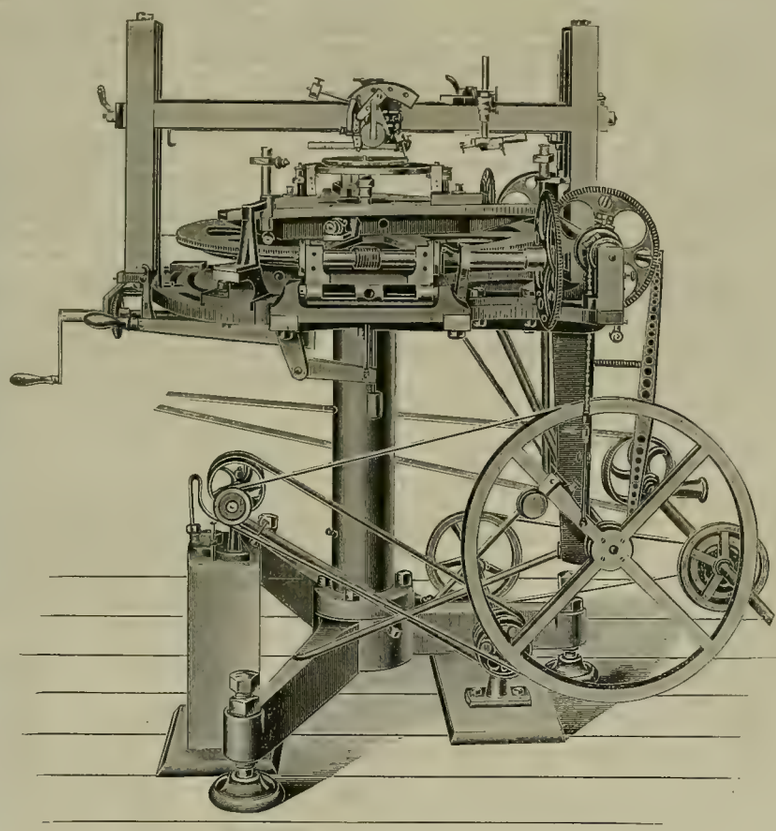
ONE of the newest mining districts of the Great Basin now attracting attention is that at Stateline, in Lincoln county, Nevada. Some rich finds have recently been made there which have been walked over for years.

Modern Instrument Makers and Tools.

Written for the MINING AND SCIENTIFIC PRESS by JOHN N. McCLINTOCK, A. M. C. E.

About the middle of the Seventeenth century there was a revival of scientific research, more especially in astronomy. The Academy at Florence was founded in 1651; that in Germany in 1652. The Royal Society of London, although organized in 1645, was not incorporated until 1662. The Observatory at Paris was begun in 1667; that at Greenwich in 1675. The ancient world, however, had its scholars and investigators. A building, dedicated to astronomy, made a conspicuous part of the magnificent establishment of the School of Alexandria. An arc of the meridian was measured between Alexandria and Syene, and afterwards verified by the Emperor Nero, which gave approximately the size of the earth. During the middle ages sumptuous buildings, furnished with astronomical instruments, rose successively in the plains of Mesopotamia and among the mountains of Tartary. An observatory in the gardens of the Caliph of Bagdad contained a quadrant with a radius of over 22 feet and a sextant with a radius of over 60 feet. Instruments of still larger size distinguished the Observatory at Samarcand; and the ruins of Benares attest the reality of similar constructions.

The primary problem in geography is to determine the exact position of any proposed point on the earth's surface in respect of the equator and some assumed meridian, as that of Greenwich; that is, to find the latitude and longitude. The corresponding problem in astronomy is to determine the position of any celestial object in respect to the equinoctial circle in the heavens, or else the pole, and a circle passing through the pole and the intersection of the equator and ecliptic; that is, to find its declination or polar distance, and its right ascension. The former of these is found in great observatories by the mural circle, and the latter by the transit instrument, or transit circle, and the clock.



The first transit instrument of which we hear any account was that of Roemer, which he described in 1700. Dr. Halley placed a transit instrument in the Greenwich Observatory in 1721. The axis was iron, and the telescope was about 5 feet in length. This has long been lain aside, but is still preserved as a relic. The great mural quadrant of iron at the observatory was erected by Graham in 1725 and redivided by Bird in 1753. It has a radius of 8 feet. The brass quadrant was constructed by Bird in 1750. The mural circle, 6 feet in diameter, constructed by Troughton, was placed in position at Greenwich in 1812. The second mural circle was constructed by Thomas Jones in 1825.

The art of dividing instruments was carried to great perfection in Great Britain by Graham and Bird; but their preference of the quadrant to instruments of a circular form, introduced long before by Roemer, retarded the progress of astronomy. The great observatories in the early part of this century, as in the last, sought their divided instruments in London. Piazzi and Bessel worked with English circles. Troughton was an artist, the worthy successor of Ramsden—the inventor of the sextant and the maker of the first dividing engine of which there is any record; and even at the present time British astronomers, at least, do not admit that the nice contrivances and beautiful workmanship of Pepsold and of Merz, in Germany, or of Gambey, in France, have produced instruments worthy of more confidence than those which have been constructed in England. In the improvement of object glasses for telescopes, however, Germany—through Frawenhofer—and France bear away the palm, although for many years Dolland supplied Europe with his achromatic telescopes. The celebrated Mayer introduced the repeating circle, which was perfected by Borda, which permits of the fine work accomplished by the great transit circles to be done by the miniature portable transits of recent times. The foregoing facts have been mostly drawn from an old edition of the Enclyclopædia Britannica.

With the organization of the Coast Survey department in the United States, and the invitation from Switzerland of its first superintendent, Prof. Hassler, and his able corps of assistants, gathered from the United States and the different countries of Europe, including Prof. Agassiz, Count Pourtelles and others since famous, the demand for fine instruments was created in this country. For a time the demand was satisfied by importing instruments made by Troughton & Simms, Pistor & Martins, Gambey and the Repsolds. The increasing demand drew many of the best foreign workmen to the United States, who have, with native talent, placed this country in the first rank as makers of instruments of precision.

Instrument making is recognized as an art; it is not a trade, nor is it a profession. Poetry is an art, and a poet is known throughout the world by his work. The great artists among instrument makers for the last 300 years are as well known to the professional world as Newton, Shakespeare, Bacon, Webster or Longfellow to the general public.

Such a master in his chosen field was the late John H. Temple of Boston, in his day famous throughout this country. He was not satisfied with the graduation of circles obtainable in the United States when he began, and devoted many years of his life to making a dividing engine which would operate automatically. It was the masterpiece of this celebrated instrument maker, and reverted to Messrs. Buff & Berger after his death in 1874. Twenty years was devoted to its construction.

THE WURDEMANN AUTOMATIC DIVIDING ENGINE.

Contemporary with Mr. Temple was another master mechanician, William Wurdemann of Washington, enjoying to-day a well-earned retirement at the age of nearly ninety, who, while in charge of the instrument shops of the Coast Survey department, devised and constructed an automatic dividing engine, which at the time was considered the only rival of the Temple engine. C. L. Berger & Sons, successors to Buff & Berger, of Boston, Mass., not only own the Temple engine, but have recently purchased the Wurdemann engine, to the construction and perfection of which the labor of not less than twenty years or so was devoted.

In this country to-day there are several instrument makers of note. Among them may be mentioned Young of Philadelphia, Stackpole of New York, Saegmuller of Washington, Berger of Boston and others, whose reputation for making fine instruments is known in every part of the civilized world.

The writer has been honored by a personal acquaintance with C. L. Berger for over thirty years, and has been an admirer of his well-designed and finely-constructed surveying instruments. To show to what extent the degree of accuracy has been attained in these instruments, he has taken one of Berger's ordinary 6-inch transits for secondary triangulation, with a vernier reading to 30″, and read the rough angle by using a glass to 5″. By reading two sets of six, reversing the telescope, and filling the circle, correction at the center would be less than 1″. Triangles would require an adjustment of less than a second to an angle. No more perfect work could be done with a Gambey 12-inch circle graduated to 3″. It is simply perfection in the art of instrument making. If any young reader wishes to obtain similar results, the writer would advise him to use the Berger transit as he would a Gambey theodolite; see that it is in as perfect adjustment as when received from the maker, that it is kept in the box between stations, that the box rests on rubber cushions, and that during observations the instrument is sheltered from direct sunrays by a sunshade. To illustrate to the unprofessional reader the fine execution of these transits, by which an angle can be read to one second of arc, it must be remembered that at a distance of five miles a second of arc is $\frac{1}{1000}$ of a foot, or about 1¼ inches; at a distance of a mile, $\frac{1}{5}$ of an inch.

Many years ago the faults in the great mural circles and transit instruments of the observatories were discovered by the smaller, but more delicately constructed circles of Gambey, Repsold and other old masters; only recently has such perfection in instrument making been attained that the small portable surveyor's transit will do the work of the larger theodolite of old.

The graduation of the circles being a matter of such vital importance, it will be understood why the Messrs. Berger secured the celebrated Wurdemann and no less famous Temple dividing engine in addition to their old 2-foot automatic engine, said to have been begun by Ramsden of London and imported into this country.

The Wurdemann automatic dividing engine was designed and perfected by Mr. William Wurdemann, a celebrated mechanician of Washington, who devoted many years' labor to its construction. Although the circle of the engine is but 30 inches in diameter, a meridian instrument circle of 45 inches diameter has been graduated upon it to two-minute spaces, making 10,800 lines, with a very satisfactory result, the probable error not reaching two seconds of arc, a degree of accuracy thought never before attained. The engine consists of a circle with 2160 teeth on its outer edge, supported upon a perpendicular axis and moved by a tangent screw gearing working on the teeth of the circle. One full revolution of the tangent screw moves the circle ten minutes. The graduated drum on each of the two tangent screws divides the revolution into 120 parts, the movement of one of which moves the great circle five seconds. The circle to be graduated is securely fastened to the circle of the engine, the engine is connected with the motor, the graving tool moves in a radial line on the surface of the silver limb to be graduated until its mission is accomplished, when it is raised from the surface and is returned to its original position. While it is returning the tangent gearing of the main wheel is moved a certain fraction of a full revolution, the main wheel moving a corresponding distance, two minutes, five minutes, ten minutes, fifteen minutes, twenty minutes, thirty minutes, or a degree, comes to a rest when the graver descends and puts in its work.

The action of the engine is automatic. When once set in motion it continues its work until the full revolution of the main wheel is completed, when from its own mechanism the movement ceases. The movement of the wheel is by a force applied simultaneously by the two driving screws on opposite sides geared together, thus producing a uniform motion in the same direction and at the same speed and serve to divide and equalize any errors or differences arising from slight imperfections in the gear teeth or screws. In consequence of the greater contact surface, the moving screws and the engaging teeth of the circle, there is less pressure and friction on each one of these parts and the center bearing is relieved of side pressure. The axis of the circle is a cylinder where attached to the circle, ending below in a hard steel core that bears the weight. The effect of this long cylindrical axis is that the circle turns with uniform ease under all conditions of temperature. The axis enters a cast-iron column into which its upper end is perfectly fitted, so as to turn easily without any possible shake. The column is supported on a cast-iron tripod with thin leveling screws that step into iron cups. On the upper part of the column is fixed a cast-iron frame on which all the necessary moving parts are supported. The circle and its bearings are also of hard cast iron, a dense, hard metal having a small coefficient of expansion and consequently not affected by slight changes of temperature.

If Private Property, No; Government Property, Yes.

TO THE EDITOR:—In your issue of Sept. 30th was an editorial on the "Rights of Property Holders Along a Stream." I should like to have your opinion as to whether the land within the banks of a non-navigable stream, between the two meander lines, can be located under the mining laws, either when the property down to the meander line is in the hands of private holders or when it is still Government land.

READER.

The Influence of Forests Upon Storage Reservoirs.

Written by JAMES D. SCHUYLER of Los Angeles, Cal.

In an arid region where irrigation is a necessity and where the streams are intermittent in their flow, ranging in discharge from violent floods to trickling rivulets, storage reservoirs are essential for any considerable extension of the irrigated area.

Sites for reservoirs of large capacity are scarce, where all conditions are right for the construction of safe dams, for the certain filling of the reservoirs, and for the convenient distribution of the water to lands suitable for its use. The scarcity of such sites renders it all the more essential that those which exist should be guarded from all influences tending to the destruction of their usefulness.

The mountain slopes of southern California are more than ordinarily precipitous, and the denudation of these steep slopes of their forest growth by destructive fires, or by equally destructive bands of sheep, tends to loosen the surface soil and render it easily eroded, so that as the vegetation of the mountains disappears, the streams become more torrential, and more heavily laden with debris. All this gravel, sand and soil is deposited in the beds of the reservoirs located in their path. The result is to fill the space which should be devoted to the storage of water and lessen its capacity. The rapidity of this destruction of the reservoirs will depend somewhat upon their location; if they are in the mountains and have large watersheds of steep slopes they will more rapidly fill with coarse material. If they are nearer the plains on flatter slopes they will receive sand rolled along the bottom of the stream at the upper ends, and fine mud over the remainder of the area. Under these conditions they will fill less rapidly. The Sweetwater reservoir, near San Diego, is a type of the latter class, where conditions are most favorable. Recent measurements have shown that the deposit in the reservoir during the eleven years of its existence has been about 5% of its total capacity. The filling has been almost directly as the depth of the water, being greatest at the dam, where the fine mud is 2 to 2½ feet deep, largely from the washings of the plowed fields. Were this reservoir higher in the mountains the filling would be coarser and of greater volume, and if the reservoir were smaller it would of course fill more rapidly.

Clear Water.—Streams should always run clear, or nearly so, and their volume should be uniform throughout the year. The more perfectly the watersheds are covered with forest growth, decayed leaves, brush, chaparral and hardy grasses, the more nearly will this ideal condition of run-off be approached. The soil will be so bound with a network of roots that the rain and melted snow will pass off slowly without washing the surface, and the storage reservoirs receive a minimum of detritus and a maximum of water. This ideal condition, when perfectly attained, becomes in fact a substitute in large measure for storage reservoirs, and the soil itself of the mountain forests is converted into a great sponge, which constantly replenishes the springs and streams and keeps them in more uniform flow. Under such conditions, reservoirs could only be needed to store the water of the rainy season for use in the summer months, while the streams themselves would have higher irrigation duty in the dry seasons. A general extension of forest growth will make available many small reservoir sites that are now practically worthless because of the torrential nature of the streams, and their exposure to rapid destruction. The essential, therefore, for the preservation of storage reservoirs and the general increase of stream flow is to maintain as dense a growth of vegetation upon the mountains as possible, and so patrol the sources of our streams as to prevent forest fires.

Influence of Forests.—It is not well established that forests have any special influence in increasing the rainfall of a region, although the presumption is that they have a slight tendency in that direction. But it is conceded that they have a very decided influence upon the temperature. In southern California, we particularly need all such influences to counteract the effect of desert winds upon our orchards, and lessen evaporation upon our reservoirs. The loss by evaporation in reservoirs, ranging as it does from 10% to 50% of their capacity annually, according to their relative depth and surface area exposed, is one of the most important factors in estimating the duty of stored water. No other losses can compare with it and anything which will lessen it will extend their usefulness. A general extension of the forests of the arid region must have marked effect in cooling the surrounding atmosphere, reducing the velocity and temperature of winds, increasing humidity, and lessening evaporation.

Reforesting.—One of the encouraging features of the situation on the Pacific slope is the rapidity with which all forest trees, except the redwood, are being reproduced wherever they are protected from fires and from the ravages of sheep. Young pines, firs and cedars spring up spontaneously where there is soil and moisture, and grow with vigor if let alone. This is a marked contrast to the sand plains of Wisconsin, Michigan and other eastern States, where the pine forests, once out, seldom reproduce themselves, but are replaced by brambles and worthless brush. With proper care, therefore, the Western forests can be made a constant source of revenue, continually replenished.

Government Reserves.—A popular misconception of the intent and object of the Government in segregating forest reserves at the headwaters of our streams, is that they are to be forever left in a virgin state, and so lost to public utility. This opinion is widely held, and needs to be eradicated, for the reverse is really true. The forests are not and should not be regarded as too immaculate for use. It is well recognized as far better and safer to make them a source of lumber and firewood, utilizing the older trees and encouraging new growth, than to allow them to go to maturity and decay untouched. The guardians of the forest preserves should be required to gather seeds of trees and plants and sow them wherever they can be induced to grow. They should keep the young groves of trees properly thinned out and have authority to sell sawlogs and firewood wherever the trees can be judiciously spared.

Fertility in Irrigation Water.—One of the important, though little considered, uses of the forest to the irrigator is the conversion of organic vegetable mold into nitrogenous plant food. This is going on through the agency of the ever-present bacteria, which reconvert the organic waste of the world into innocuous and useful mineral matter. Water, filtering through the soil, is constantly bearing these mineral nitrates into the streams and thence out upon the lands. Streams from treeless mountains lack these nitrogenous elements to a great degree, and the water has less fertility and is less valuable for irrigation.

Forest Destructivn.—The effect of the destruction of forests in mountainous regions is eloquently described by the eminent French political economist, Blanqui, in a memoir read before the Academy of Moral and Political Science of France, in 1843. He says, in referring to the Alps of southern France:

"Signs of unparalleled destruction are visible in all the mountain zone, and the solitudes of those districts are assuming an indescribable character of sterility and desolation. The gradual destruction of the woods has in a thousand localities annihilated at once the springs and the fuel. The abuse of the right of pasturage and the felling of the woods have stripped the soil of all its grass and all its trees, and the scorching rays bake it to the consistency of porphyry. When moistened by the rain, as it has neither support or cohesion, it rolls down to the valleys, sometimes in floods, resembling black, yellow or reddish lava, sometimes in streams of pebbles, and even huge blocks of stone, which pour down with a frightful roar, and in their swift course exhibit the most convulsive movements. No tongue can give an dequate description of their devastations in one of those sudden floods which resemble in almost none of their phenomena the action of ordinary river water. They are no longer overflowing brooks, but real seas, tumbling down in cataracts and rolling before them blocks of stone, which are hurled forward by the shock of waves like balls shot out by the explosion of gunpowder. A furious wind precedes the rushing water and announces its approach. Then comes a violent eruption, followed by a flow of muddy waves, and after a few hours all returns to the dreary silence which at periods of rest marks these abodes of desolation."

French Forestry.—After years of agitation and discussion, the work of restoring the woods and of controlling the floods and destructive erosion of the torrents was undertaken by the French Government at enormous cost, but with gratifying results, wherever carried out. The improvements consisted (1) of the systematic planting of trees, grass and underbrush near the source of the streams, to prevent the sudden and rapid collection of rain and melted snow water. (2) The protection of the shores of the streams from undermining and their beds from erosion, by the erection of small dams of masonry, loose rock and brush, to diminish the grade and decrease the power of the water, to raise and widen the bed and to retain and store detritus. Many of these structures were made of green branches that were induced to take root and grow. (3) The terracing of the mountain slopes in a way to retard the run-off and guide the water into channels of light grade, where it could be conducted to the main streams without washing the soil. On one small watershed of less than 1000 acres the Government expended $125,000; but the benefits resulting immediately after completion were estimated at more than double that sum.

Other European Forestry Work.—The Austrian and Swiss Governments have done a great deal of this work to restore the mountain watersheds to their original condition before the forests were destroyed, and great numbers of masonry dams have been erected, to an extreme height in one case, in the gorge of Ferrina, Austrian Tyrol, of 115 feet. These are built exclusively for retaining debris and curbing the power of the torrents. The usual height of such structures, however, is about 25 feet, and they are placed as near to each other as the grade of the torrent necessitates. Their effect is incidentally to store water, as well as gravel, for the voids in gravel reservoirs of that kind retain a considerable volume of water, which is given off gradually to the stream. Such work can be done to advantage on every mountain stream in California, and I have no doubt that similar works will ultimately be undertaken in various parts of the arid West as a necessity, although it will require much agitation and united public opinion to secure appropriations from the general Government for such construction. The most important work in hand, however, is to take measures for preventing the further destruction of forest, and avoid the necessity for extensive correction of erosion in our mountain slopes and streams. This costs less than the subsequent correction and is more easily accomplished.

When this is well in hand, when we have adopted practical measures for recovering our denuded mountain areas with plant growth and for protecting the forests we have left, a persistent effort should be directed toward the bridling of our torrents and the conversion of every mountain canyon into storage reservoirs. In this way only will our water supply be sensibly augmented and a large portion of the wealth of water annually wasting into the ocean or sinking in the deserts be retarded and retained for useful ends.

New Demand for Aluminum.

The Pittsburg Reduction Co. recently sold two tons of aluminum to the Carnegie Steel Co. for steel-making purposes. While this not a large sale in the present condition of the metal markets, it is interesting as showing the rapid development in the production of aluminum. When the Pittsburg Reduction Co. was formed this product sold for $17 per pound, but the present market quotation is 31 cents per pound. Aluminum is being largely introduced as an aid in the manufacture of steel. It increases the solidity of of Bessemer steel and renders the billet free from blow holes, the theory advanced by chemists being that aluminum absorbes the oxygen in the molten metal and produces a solid piece of steel. The uses of the new metal are fast extending and experiments are now being made to adapt it to new purposes. Efforts are now being made to perfect a process for soldering the new metal. This has long been sought, as one great drawback in adopting aluminum to new uses has been the difficulty in making joints. A successful process of this kind will enable aluminum to be used for roofing and will greatly increase its use for stamped ware. The works of the Pittsburg Reduction Co. at New Kensington are pushed with orders, the majority of which are for sheets.—Iron and Steel.

Ammonia as a Fire Extinguisher.

In an instance where fire had originated, probably from spontaneous combustion, in a pile containing several tons of cotton seed, and the interior of which was almost a solid body of live coal, a half gallon of ammonia completely smothered the fire. In another, which occurred in Savenay, France, the vapors of a tank containing fifty gallons of gasoline caught fire in the linen room of a laundry. The room was instantly a mass of living flames, but a gallon and a half of ammonia water thrown into it completely and almost immediately extinguished the fire. The ammonia was in a glass demijohn in an apothecary's shop next door to the laundry, and was thrown into the room by the druggist as an experiment. To use his own words in reporting the circumstance * * * "The effect was instantaneous, torrents of black smoke rolled upward in place of flames, and in a moment every trace of fire was gone. So completely was the fire extinguished that workmen were enabled to enter the room almost immediately, where they found the iron tank of gasoline intact.—National Druggist.

Draining Wet Tunnels.

In California, where most of the railway tunnels are driven through soft sandstone, the floors are naturally wet and have long occasioned many repairs which would be unnecessary were the floor dry. The Southern Pacific Railroad to remedy this difficulty have employed ordinary drain tile for the purpose of draining the floors of its tunnels, with satisfactory results. The tiles are the common 4 inch or 6 inch clay pipe without flanges and are laid on each side of the track in a drain trench provided for them, and are placed a short distance apart in order that the water seeping into the excavation from the surrounding rocks may find an easy passage into the tile and flow away, which it does readily. If the pipes were closely joined the water would be excluded and the object of the drain would be defeated. There may be places where this plan might be applied with success in metal and coal mines where water on the floor of the tunnel proves a source of annoyance or expense. In soft ground posts stand far better if the ground be well drained.

Mining Summary.

DIRECTOR OF THE MINT ROBERTS makes the following report upon the production of gold and silver during the calendar year 1898:

The production of gold in the United States in the calendar year 1898 was 3,118,398 fine ounces, of the value of $64,463,000. The amount of gold produced from quartz mines in 1898 was, in round numbers, 2,800,000 fine ounces, and from placer mines 318,000 fine ounces. The South African Republic produced 3,831,975 fine ounces, of the value of $79,213,953. Australia produced 3,137,644 fine ounces, of the value of $64,860,800. These three countries are the great producers of the world, their output aggregating 10,088,017 fine ounces, of the value of $208,537,753, or 73% of the product of the world.

Next comes Russia, with $25,463,400; Canada, $13,775,400; Mexico, $8,500,000; India, $7,781,000, and China, $6,078,700.

These five aggregate 92,686 kilograms, valued at $61,599,000, or over 21% of the whole, leaving 6% to the remainder of the world.

The United States still occupies the second place as a silver producer, to which it was relegated by Mexico in 1897. In 1898 it produced 54,438,000 fine ounces of silver, with a commercial value of $32,118,400, against the Mexican production of 56,738,000 fine ounces, with a commercial value of $33,475,000. Together they produced 67% of the world's product. No other country approaches them, the nearest being Australasia, Bolivia and Peru. The product of the last two is somewhat uncertain, but none of the three exceeds 12,000,000 fine ounces.

The amount of silver produced in the United States during the year from quartz mines was, in round numbers, 13,500,000 fine ounces, and from lead ores 31,000,000 fine ounces, and from copper ores 10,000,000 fine ounces.

The world's gold production in 1898 was 13,904,363 fine ounces, of the value of $287,428,600, an increase over the product of 1897 of 2,351,831 ounces, valued at $48,616,600. Since 1887, when about $106,000,000 were produced, each year has shown an increase over the preceding one.

There is no reason to expect any cessation of this steady annual income for some years to come. The Transvaal has not nearly reached its limit; Australia, particularly West Australia, is not yet half developed; Alaska and the Yukon have only fairly begun to produce, while the recent steady increases in Colorado and other Western States shows no signs of abating.

The world's production of silver in 1898 was 165,295,572 fine ounces, showing an increase over 1897 of 1,222,400 fine ounces.

The world's consumption of the precious metals in the arts and manufactures during the year was, in new gold, 97,804 kilograms, of a value of $65,000,000; and in new silver, 1,065,289 kilograms, of a coinage value of $44,273,000 and a commercial value of $20,200,000.

The following table shows the production of gold and silver in the principal producing countries of the world during the year 1898:

Countries.	Gold.	Silver. Fine Ounces.
United States	$64,463,000	$54,438,000
Africa	80,428,000	.....
Australasia	64,860,800	12,021,682
Canada and Newfoundland	13,838,700	4,452,333
Mexico	8,500,000	56,738,000
Russia	25,463,400	278,492
British India	7,781,700	.....
China	6,078,700	.....
Germany	73,600	5,571,516
Bolivia	343,500	3,204,568
Chile	340,700	2,501,998
Spain	37,900	5,597,965
British Guiana	2,048,700	.....
Colombia	2,263,200	5,483,718

ARIZONA.

GILA COUNTY.

Old Dominion is producing from its single shaft 800,000 pounds of copper per month.

Globe *Times*: Last week an accident occurred in the Old Dominion shaft. A cage was descending and a car on the opposite cage was coming up, when near the 400-foot level the car got loose and came in contact with the timbers, which were torn out and the car and its contents precipitated into the shaft. The men in the cage escaped unhurt. When the cage struck the engineer did not notice any effect from it in the operation of the hoist, and the first intimation he had that anything was wrong, the headgear was pulled down, wheels, blocks and all. Several men who were under the sheaves escaped uninjured. The cage occupied by the men was caught by the safety catch.

MOJAVE COUNTY.

In the Stockton Hill district the veins are fissures. The minerals filling the veins are galena, blende, pyrite and chalcopyrite, argentite and ruby silver, with native wire silver, and, as secondary products of oxidation, carbonate and sulphate of lead, copper carbonate, iron oxides and chloride of silver, in a quartz gangue.

Kingman *Miner*: A discovery has been made in the Alpha mine at Layne Springs. The vein in which the strike was made is one of the largest in the district, but of late years little work has been done on it. About 1000 tons of ore is lying on the dumps. On the suggestion of T. McMahon the owners made a test for copper, and the ore contains 20%. The owners cut into what was supposed to be the foot wall of the ledge and exposed a 10-inch vein of ruby silver ore. Fifty feet above this the foot wall ledge was opened and horn silver exposed. The mine is opened by a long tunnel connected by the shaft with the surface. From the tunnel is a winze 80 feet deep, with 4 feet of ore said to carry 20% copper, twenty ounces silver and some gold. Heretofore only silver and lead values were paid for and owing to the locality the lower grade ores were considered worthless.——Sutlier & Roscoe are getting prospects of gold in their camp across the valley from White Hills. Every outcrop of quartz shows gold. C. Metcalfe of Kingman is interested with them.

Kingman *Mineral Wealth*: The crosscut on the Midnight at Chloride passed through four Midnight, at Chloride, passed through four large veins of mineral, and another vein is known to be within a few feet of the end of the crosscut. From present development it is thought enough shipping ore can be taken out in development, without stoping, to pay expenses.

PIMA COUNTY.

Tucson *Star*: The wolfram claims sold to Engineer Bradford by Sampson & Bent are being worked by a New York company. They are in the Guijas mountains, six miles north of the Cerro Colorado mine. The owners of the property are grading and getting ready to erect a concentrating plant. They will concentrate and ship east for treatment.——N. Wild and J. Sheridan have seven claims on the belt, three miles south in the Cerro Colorado district. They have a good showing of fine ore and are developing it.——Water is being raised out of the old workings of the Cerro Colorado in the Guijas mountains and the workmen expect to get into the shaft this week.

YAVAPAI COUNTY.

(Special Correspondence). — The Arizona, Eastern & Montana Copper Co., operating the Big Bug smelting plant at Mayer, have made their first shipment of fifty-four tons of copper matte. The matte carries gold and silver. The plant is managed by H. B. Clifford. D. G. Jewett is the superintendent and metallurgist. J. S. Johnson is the chemist and assayer. Ores are being hauled to the smelter from the Lone Pine mines.

Arizona City, Oct. 21st, '99.

Prescott *Courier*: The recent rains did not reach the Hillside section of country and Boulder creek is dry for the first time in twenty years. The Hillside mill has been shut down.——W. Connors has gone to Morristown, Arizona, to do work on mining claims owned by M. Hickey. Morristown is the new name for Hot Springs Junction.

Daily Enterprise: T. E. Farish will superintend the development of the claims of the Whipsaw M. Co. on Castle creek. Forty men are at work on the property. The company has contracted with S. W. Traylor of Denver, representing the Colorado Iron Works, for a 40-ton smelter.

YUMA COUNTY.

Yuma *Sun*: The second monthly cleanup was made at the King of Arizona last Tuesday and is reported to be about $30,000.——C. E Eichelberger, discoverer of the King of Arizona, reports a discovery of copper ore in the Plomosa district, fifteen miles from Tyson Wells, and will develop it. The outcrop is 40 feet wide and a majority of the ore will bear shipment. The new find is thirty-five miles from the Colorado river.

CALIFORNIA.

Amador.

Jackson *Republican*: Rock from the Central Eureka mine is being treated at the Zeila mill.——The Grizzly Hill gravel mine, which J. Meek has been operating for about a year, has been sold to San Francisco parties. The new Supt. is Mr. Tucker.——A highly mineralized rock has been encountered in the Lincoln mine. The rock was found in crosscutting at the 500. Sinking is progressing, the shaft being down 1180 feet.

Sutter Creek *Record*: During the week good ore has been found at the 500-foot level of the Lincoln mine at Sutter Creek. Supt. Voorheis says it is good paying ore. The crosscut will be extended west until the black slate foot wall is reached. The shaft is down 1190 feet. At 1200 feet a station will be cut.

Butte.

Oroville *Mercury*: The Lost Treasure mine, near Inskip, has made a big cleanup. It is a pocket ledge 14 inches wide, and is owned by A. D. Larzelere. In one day early in the present month Mr. Larzelere panned out $500 besides rich specimens of quartz showing free gold. Mr. Larzelere has taken out several small pockets this summer.

Calaveras.

The Topeka mine, near the Sheep Ranch mine, owned by W. L. Fortner of Jackson and partner, will be worked by an arrastra during the rainy season.

The new 40-stamp mill at the Gwin mine is ready for operation whenever there is sufficient water for power. The former mill of forty stamps is working steadily. A large amount of ore has been developed. It is the purpose of Supt. Thomas to carry the development so far ahead of the extraction of ore that another addition to the milling plant may be anticipated.

El Dorado.

The Amador cinnabar mine, near Placerville, was discovered in 1874 and considerable development work done. Furnaces were built and a quantity of quicksilver produced. The surface chamber was exhausted and the works abandoned. In view of the present high price of quicksilver, steps are being taken to rehabilitate the old mine and explore it for new ore bodies. The mine is within thirty miles of Sacramento.

Jackson *Dispatch*: F. A. Bass, foreman at the Boulder mine, in the western part of this county, is engaging miners with a view to a resumption of work at the mine.——A 10-stamp mill is being put in at the Kimball gravel mine, south of Placerville. The *Democrat* says that a large body of pay gravel has been blocked out.

Georgetown *Gazette*: The Little Gem mine is half a mile southeast of Volcanoville, on the ridge between the east and west branches of Grizzly canyon. Discovery was made a year ago by Root & Schultz. It afterward passed into the hands of San Francisco parties, with Judge Bahrs as Supt.

Kern.

Randsburg *Miner*: The Butte mine is down 35 feet in a new shaft 400 feet from west end of the claim, in good ore. They are also drawing all stopes at the extreme east end.

Lassen.

Redding *Free Press*: Hayden Hill is twenty-two miles southeast of Bieber. The principal mines lie southward from the town.——In the Golden Eagle mine from the 250 level down to the 300 the ore body is in several places 25 to 30 feet wide. The 400 level is showing up better.—— The Juniper mine, being worked by McFarland Bros., is looking well.——The Buckskin, owned by Redding men, is idle. There is talk of putting in a cyanide plant next spring.——The Hayden Hill Tunnel Co. is in 109 feet. The air shaft is down 30 feet and 62 feet sinking will connect it with the tunnel. The tunnel is located on the northwest slope of Hayden hill, half a mile from the town of Hayden Hill.

Mariposa.

At the Mariposa mine the machinery is being put in place. Power will be supplied by three 80 H. P. boilers. The old shaft is being enlarged to three compartments, 4x6½ clear. Connection has been re-established between the old shaft and the tunnel at the first level. Heavy hoisting and air compressing machinery will be put in and the mine opened to a depth of 1000 feet. In the early days this mine was extensively but extravagantly worked. R. W. Raymond's official report says that during August and September, 1870, the ore milled $9.98 per ton, which was too low grade, as steam power was used. This grade of ore to-day will pay a large profit, with modern methods, improvements and conditions.

Nevada.

H. A. Fairbanks of Grass Valley has taken the Keystone mine, near Grass Valley, and organized the Keystone M. Co., to operate the mine. Formerly, when worked, this mine produced ore running $30 to $40 per ton, and lately ore has been mined and milled running $19 per ton. The company will develop the mine by means of a shaft, only tunnel work having been done thus far.

Nevada City *Herald*: On the 21st inst. a storage dam on Dobbins creek, owned by the Yuba Power Co., went out, and several buildings and a lot of machinery were swept away. The accident will cause delay to the company's operations on the North Yuba river.

Grass Valley *Telegraph*: The Champion M. Co. of Nevada City has declared an $8000 dividend. The Champion was never as rich as at present. The recent discovery of the new vein in the old Soggs claim is the most important strike made in the property in recent years. The ore is high-grade. The ledge in the old Soggs ground was worked to the level of the creek and abandoned. This has been reopened, and the discovery is in virgin ground. The Providence, across the creek, is also doing well and paying dividends.

Riverside.

The Indian Queen mine, three miles west of Perris, at the head of the Spring canyon, has been bonded by Mr. Andrews.

A large ledge has been opened on the Jumbo, on the summit of the hill east of the Santa Rosa. A 5-stamp mill will be built.

San Bernardino.

The copper mines four miles east of Oro Grande station are being developed. The ore occurs scattered along on or near the contact of diorite and limestone, and is mostly chrysocolla and malachite at the surface, turning to chalcopyrite with some borite in depth. Large masses of iron sulphide containing a small percentage of copper sulphide have been exposed in the workings. The mines have only superficial development, but are well situated, and the extent of the surface showing of ore justifies exploration.

It is reported that J. K. De Lamar has bought a 40-stamp mill for the Gold Mountain mines near Holcomb Valley. There is a large amount of ore in sight in the open cuts of the property, which may be mined and sent by tram or chute directly to a mill at the foot of the hill.

San Bernardino *Sun*: The Turquoise mines, sixty miles northwest of Vanderbuilt, have been sold to J. B. Wood of New York.

San Diego.

Most of the force at the Owens mine, near Julian, has been laid off, the cause not being stated.

The richest mine in the Julian district was the Golden Chariot, six miles from Banner. It produced a large amount of high-grade free milling ore. It has been idle about twenty years.

The most remarkable mine in the district is the Ready Relief, which has become noted on account of its peculiar vein structure. The ore is a silicification of the mica slates in which it occurs, and these have been folded in a series of close, complex folds, the result of a strong compressive stress, which, while sufficiently strong to fold and crumple the rocks, ceased before fracture resulted. The original slaty structure is still clearly seen in the large quartz masses, which are impregnated with iron sulphide and gold.

Santa Barbara.

Santa Barbara *Press*: The Las Conchas mines, with the exception of one, have finished their work for the season and closed down. The one remaining open will close on the first of the year. The company operating these mines will exert all their energy at the La Patera mines, as the demand for asphalt does not necessitate operations at both places.

Shasta.

(Special Correspondence.)—A Michigan company developing the Popejoy claims under bond, near Copper City, this week found an ore body that runs well in copper and carries some gold.

In the Spraggin claims, near Redding, a new ore body was found yesterday, carrying high values in gold.

Work has been resumed in the six-claim group of the Conners mine and the mill will be started so soon as water is sufficient. Wells are being driven for water supply.

Work will be resumed shortly by a San Francisco company on the Black Spider mine, near Keswick, who expect to place machinery to unwater the shaft.

In the Muletown district there is considerable activity in the development of a dozen properties, notably the Mabie group, the Black Bear, the Rabbit, The London Tunnel Co. and the McDaniels group.

Redding, Oct. 24th, '99.

Free Press: It is reported that a rich strike has been made at the Iron Mountain mine, while opening up the ore body discovered some time ago in prospecting with the diamond drills. The character of the sulphide has improved.

Redding *Searchlight*: A. J. Wright, who is working at the Cleveland Con. mines, in the Bullychoop country, for Beall & Coleman, reports that they are working thirty men at the Cleveland. The old workings have been cleaned out and new ground being worked is yielding good ore. The 10-stamp mill has been repaired.

Redding *Democrat*: The Rabbit mine, owned by T. J. and F. O. Jordan, is located two and one-half miles west of Centerville, in the Clear Creek mining district. The gulch, which is crossed by the road where it passes under the Queen M. Co.'s pipe, has been worked since 1849 and has paid, it is said, $100,000. It is at the head of this gulch that the Rabbit mine is located. The ledge has been explored in several places; at one place a perpendicular shaft has been sunk 50 feet. The pay chute is 500 feet long. The ledge varies from 4 to 12 feet in width and the values are high in both free gold and concentrates. The vein matter contains talc and ochre, and an ore resembling gray copper. All of it disintegrates upon exposure to the air. The owners have not decided upon the method of treatment.

Sierra.

Downieville *Messenger*: G. Black started up the mill at the Triple Pocket mine last Thursday, which has been shut down for some time past on account of lack of water. The late storm furnished sufficient water to run the mill.

Siskiyou.

The Americus Gravel M. Co. has been incorporated by S. L. Lezynsky, F. W. Pags, F. L. Lezynsky, M. Koshland and G. Lezynsky; capital stock, $300,000. This company will operate placer mines near Yreka.

Yreka *Journal*: W. A. Farish of Denver, Colo., has examined the Dewey mine at Gazelle. As the parties could not agree upon terms Mr. Farish was not called on to thoroughly examine the property and returned home.——The Little Tiger or Cape mine at Greenhorn has been traced 3000 feet to the top of the mountain, where a shaft was sunk 12 feet on a ledge 7 feet wide. A tunnel has also been run in 115 feet at the mill in the creek on a ledge 4 feet wide. The company is getting up more machinery.——The work of sinking the shaft in the Greenhorn Blue Gravel No. 2 mine, at the Nehrbass ranch, is progressing slowly, with a large quantity of water to contend with. Some gravel has been hoisted into the sluices which pays.——The old Blue Gravel mine at Greenhorn is worked with a full crew day and night, and a new shaft will be sunk.——At the Schroeder mine on Deadwood mountain they are getting out quartz for crushing during the winter season, when sufficient water is obtainable for operating the mill successfully.

Etna *Advance*: A force is employed at the Gold Run mine at Gilta, repairing and making improvements. A new pump and hoisting works have been ordered. When the work now under way is completed the mine will resume operations with a full crew.

Yreka *Journal*: The miners at the Greenhorn Blue Gravel No. 2 mine on the Nehrbass ranch have struck bedrock at a depth of 141 feet. They first found a large boulder, with a small layer of gravel underneath, and then sunk 8 feet into bedrock, to be deep enough for possible depressions at other points in running drifts, besides affording a reservoir for the pumps. The gravel prospects well. It lies between a cement rim or false bedrock and the permanent bedrock, which is soft.——More claims are being located in the Gazelle district, at the head of Willow creek and Park creek, principally quartz, which contain copper, gold and silver.——The Siskiyou M. Co., J. W. Martin Supt., has been prospecting the Mabel mine between Oak Bar and Scott Bar, and the quartz mill bought from Chamberlain & Timmons will soon be set up.

Trinity.

(Special Correspondence) —The Globe mine, at Dedrick, comprising six claims, was sold this week by the owner, R. Woodburn, to a French company, represented by H. M. Hall and H. Duvergay, Supt. and Sec. respectively of the LaGrange M. Co., for $125,000 cash. The mine has a 9-foot ledge that is said to plate $40 a ton. There is a 5 stamp mill on the property. The mine was purchased by Woodburn in '91 for $4000, since which time he has expended $50,000 in its development.

Near Trinity Center a ledge 5 feet wide has been opened that is locally attracting considerable attention. It is a hornblende granite that has been transformed into a reddish-blue color, carrying 4% copper and $7.50 per ton gold.

Trinity Center, Oct. 24th, '99.

Trinity *Journal*: G. L. Carr has put a cannon ball mill with a steam plant on Copper creek, near Carrville, and is crushing ore from the Yellow Rose of Texas mine. The ore is rich. He will also crush ore from the

Forget-me-not and other mines owned by him in that vicinity.——The Graves Bros. have taken out another pocket from the Blue Jib mine, which gave Coffee creek prominence. ——It is reported that the Copper Queen Co. of Napa, which recently bought the Copper Queen and other copper mines in that vicinity, will erect a smelter.

Tuolumne.

Gen. Mgr. Buckminster says regarding the Santa Ysabel gold mine: Have cut the Central ore shoot on the sixth level, and the ore is good grade. No. 1 shaft is down 760 feet. The sixth level south from No. 1 shaft is in 200 feet, and in the vicinity of the main south ore shoot.

A group of claims is being developed on Turnback creek, eleven miles southeast of Sonora, by J. B. Brescia. Grading for a mill is in progress. Water has been appropriated for power.

Within the past few weeks 6 inches of rain has fallen in this county, and as a consequence most of the mines which have been idle are again in operation and will continue as long as the water lasts. The Eagle Shawmut, at Jacksonville, is dropping forty stamps.

Capt. W. H. McClintock, of Sonora, Supt. of the Goldwin gold mines on the Tuolumne river, reports his shaft down 145 feet in 5 feet of quartz, half of which is laminated and of good grade, and the remaining half rich in gold. The old stopes have been cleaned and some samples obtained which return assays of $60 to $70 per ton. He is negotiating for a gas engine for the property.

Sonora *Independent*: J. F. Callahan of Boston has been in Tuolumne county looking after his mining interests near Big Oak Flat. Some time ago he purchased the Rhode Island, Eureka and Mississippi mines in that vicinity. The Rhode Island adjoins the Mt. Jefferson mine at Groveland.——The 20 stamp mill at the Dutch mine at Quartz has started up, using steam power with coal for fuel. The shaft is down 1209 feet.——At the Jumper mine, south of Stent, the shaft is down 1200 feet and sinking is in progress. Timbering and general repairing are being done. The mill is not running.——The Mazeppa mine, south of the Jumper, has sunk below 400 feet, and when the shaft is at 500 feet they will open up north and south. This mine is also using coal for fuel.——The Arbona mine at Tuttletown is down 487 feet. A vein 3 feet wide shows at the bottom of the shaft, the ore being sprinkled with gold and sulphurets. When the shaft reaches a depth of 500 feet drifting will be commenced north and south. There are 600 tons of ore on top and the stopes are full of ore.——At the Santa Ysabel mine at Stent heavy hoisting machinery is being installed and a large gallows-frame hoist being built preparatory to deep sinking.—— The O K mine, near Tuttletown, is running under Supt. Blake.

COLORADO.

BOULDER COUNTY.

Ward *Miner*: The Big Five is steadily driving the three tunnels—the Adit, Ni Wot and Dewdrop. The main work is confined to the two first mentioned, but recently air pipes have been run to the Dewdrop and machine drills are now employed in that tunnel. The Adit tunnel is in 3300 feet along the Dewdrop vein, with continuous ore nearly every foot of the way. In the breast of the tunnel is always an ore streak varying from 3 to 10 feet in width. The progress of the tunnel is from 100 to 150 feet a month. The Ni Wot crosscut tunnel, which leaves the main tunnel 2300 feet from the mouth, is now in 1150 feet. The Ni Wot tunnel has crossed under Left Hand creek, and 1650 feet more will place the breast under the Ni Wot and Columbia vein at a depth of 700 feet. With the progress now being made the lead will be reached within a year.

CLEAR CREEK COUNTY.

In what was supposed to be a barren block of ground in the Mendota mine at Silver Plume holes were put a few days ago which opened into 20 inches of mineral that runs 50% lead and thirty ounces silver to the ton. It was found by shooting into one of the walls. It has been found in this county that more crosscutting is needed.

Cleveland parties working the Maude S. mine at Empire station have erected a tramway from the mine to the railroad. They are shipping the product to the Newton mill. The cleanup a few days ago proved it to be valuable concentrating ore.

B. F. Kelly of Denver, who promoted the Nelson tunnel at Creede, has taken the Alaska property at Georgetown under lease and bond. It is the intention to drive a tunnel to open up the vein below the old workings, which are showing large bodies of iron pyrites.

GILPIN COUNTY.

The mills at Black Hawk are handling a heavy tonnage of ore. All have been obliged to use steam power, owing to the low condition of the creek, but the past week's snows have added to the water supply. During the week there were running 370 slow drop stamps and ninety rapid drop stamps, a total of 460 stamps, which were treating 550 tons. The two sampling works and the concentrator output makes a total of 700 tons of ore handled daily.

McFarland & Co. have the contract for building a new flume about 1100 feet in length by the Randolph Mill Co., and this company intends tearing out one of its twenty-five slow drop sections to put in a new one in its place. G. W. Malice Jr. is Mgr.

At the Bobtail or Black Hawk mill the work of demolition is under way. Fifty stamps have been partitioned off, so that the treatment of ore can be carried on while two new sections are being built for the Cook M. Co. The pine mortar blocks and timbers from under the batteries are being burned to catch the amalgam with which the wood has become impregnated during its years of service. The new mill is to be built under the direction of M. P. Dalton.

A mill has been built on North Clear creek, between Black Hawk and Smith hill, which will run on gravel and creek dift by the Kenyon Co. The matter from the creek will be put through a No. 8 revolving screw and from there to Bartlett tables.

Central City *Register-Call*: F. Hickman is sinking a new shaft on his Comet mine and has taken out ore all the way down. The pay is 2 feet wide.——F. M. Cobb of Denver owns four claims on the northeast slope of Colorado hill. A tunnel has been run in one of them—the Carrie K.—90 feet, and the vein is 6 feet between walls and well mineralized. Another tunnel has been driven lower, in which the vein has been cut at a depth of 200 feet.—— The Ontario-Colorado G. M. Co. is sinking its O'Neill shaft with three shifts and is down 275 feet. In the shaft there is a crevice, 2 feet of which is smelting and the balance milling ore. Sullivan air drills are being used in sinking and in driving the 200 level.——At the Washington, on Bobtail hill, a depth of 100 feet has been reached, showing a good body of milling and smelting ore has been reached.——Sinking has been stopped for the present at the Cook mine, being down 900 feet. The present force numbers eighty men. Daily shipments are being made, which will be maintained during the erection of the mill at Black Hawk.——The shaft on the Freedom mine is down 510 feet, sinking with three eight-hour shifts. Shipments of mill ore are being made.

GUNNISON COUNTY.

Gunnison *News*: The Goldsmith group, in the Gold Brick district, will be started up by D. D. Walburn of Tomichi ——The Carter Bros. have received their air compressor, and the Carter tunnel, in Gold Brick district, will be driven with air drills.——The Lead Chief and Ajax mining lodes are located in Carbonate camp on the west slope of Big Baldy, in the Gold Brick district, and are owned by Mundell, Ball, Denham & Knight, who are operating the property through tunnels. In tunnel No. 1 is a 3-foot vein of galena. Tunnel No. 3 has been driven 30 feet and a 2-foot vein of galena is showing in the breast. The ore runs 20 to 60% lead and carries $16 to $40 in gold, silver and lead.——At the North Pole mine provisions are being made for winter work. Freight wagons are moving a large amount of carbonate ore to the Hoffman smelter at Marble.——F. Dempke, foreman of the Duke of Wellington mine on Galena mountain, near Elko, says the mine has made a shipment of fifteen tons of ore. The Duke of Wellington is held under bond and lease by H. G. Ingersoll, Denver.——J. B. Crotty has a quantity of bismuth ore on hand and is having the Smith concentrator test it at Crested Butte.——The coal measures in the Elk Mountain district are to be opened by the Fuel Co.——Negley & Walleser are working on the Ready Pay, on Galena mountain. The vein is 51 inches in width. The ore is copper sulphide, galena and gray copper.

LAKE COUNTY.

A strike has been made in the Penrose at Leadville. The company has opened a body of ore running between two walls 25 feet apart.

The Hibernian shaft on Fryer hill, Leadville, a portion of the Great Hope M. Co.'s group, is making steady shipments of iron. Kyle & Donaher are the lessees, and within a short time shipments will be increased to fifty tons a day. Some of the iron is of very good grade, and occasional pockets are found that show ore rich in chloride of silver.

MINERAL COUNTY.

Creede *Candle*: The diamond drill broke into the Last Chance shaft last week, but owing to the mass of mud and rock accumulated in the shaft during the four years that the mine has been flooded, the water did not flow out rapidly. Engineer Rowley had a tin tube made the size of the hole, 17 feet long, and filled it with fifty pounds of giant powder, which was pushed up the hole and as far into the mud as possible and exploded. The water is coming out rapidly.

OURAY COUNTY.

Ouray *Herald*: Among investors in the Red Mountain district the past summer was the Standard Oil Co. Representatives of this corporation were in Ouray in June, and secured a number of promising claims. They are doing preliminary work on several claims and in the spring a large force will be employed.——The Congress mine, in the Red Mountain district, operated by the Congress Copper M. Co., of Connecticut, has been a regular shipper during the past season, its ore netting $40 to $60 per ton in gold and copper. Preparations are being made to sink the shaft. A new shaft and bunkhouse are being built. Twenty-five men are employed. ——The Buchanan Con. G. M. Co., of Boston, are driving the Lizzie E. tunnel. This was first opened in 1890, but never systematically worked. Last year, under a lease, $90,000 was taken out in three months on the Columbia-Menona vein. C. Collins has a contract for driving a 1000-foot tunnel in the direction of Ingram basin, where the vein will be cut. ——The Enterprise mine, in the Red Mountain district, owned by J. A. Adams and Dr. Hall, of Telluride, is preparing to work. A new shafthouse is being erected and other improvements made.

SAN JUAN COUNTY.

Denver *Republican*: The Paradox M. Co. has bought a group of claims in the Paradox district comprising the Mineral King, Monday, Copperopolis and Genevieve. The ore body in the Mineral King is large. The shipping ore is found in massive streaks running through the vein matter from 2 to 20 feet wide. The mass of ore will run $15 to $20 per ton, but shipments have been made yielding from $50 to several hundred dollars per ton. The 30 feet opened in the Gold King is mostly ore, and in one breast there are 6 feet of solid ore that will average 12½% copper. The property is developed by adit levels (none of which has gained great depth,) and a 130-foot shaft and every opening is in ore of good grade. The mine has been worked under lease for some time and has paid more than $9000 in royalties to the owners. The mine is equipped with a small hoist, and it is the intention of the company to put in a gasoline hoist before spring. The company has erected buildings—ore and shaft houses, etc., and will develop all winter. The ore is well adapted for matte smelting, carrying a high percentage of sulphur and all the iron necessary for fluxing, and the company proposes to erect a furnace with a 100-ton daily capacity next season. It is estimated that the ore can be mined and reduced to matte at $5 per ton. A tramway a mile long will be installed in the spring, connecting the mine with the railway. In the Genevieve claim the ore opened up is 12 feet wide, with but one wall, and is of a good average grade.——Mr. Kendrick reports activity in the surrounding mines. The tungsten deposits found there this year will be developed.——A few days ago the Little Dora, near Silverton, opened two veins with crosscut tunnel showing 6 to 10 feet of high-grade ore.

TELLER COUNTY.

The strikes made recently on Copper mountain are attracting interest and will result in increased activity in the northern section. Strikes have been made on two properties to the east and west of the Fluorine.

A strike has been made on the Tornado, at Cripple Creek, which is the best made in several weeks. The lessees operating the ground have 15 inches of smelting-grade mineral, 3 inches of which is solid sylvanite. The find was made in the block under lease to G. Bernard and associates at a depth of 200 feet. The ground is being operated through the workings of the Elkton mine. The 300 level has been extended into the Tornado Co.'s territory, and the breast is 50 feet from the Elkton line. It is at this point that the rich strike has been made; $6000 worth of ore a week has been taken out in driving the drift. With 5 feet more the lessee will be at the limit of his block, and what ore is left in the mine will be mined by the Tornado Co., equipped with a larger plant of machinery, and the company will prosecute extensive development work. As quickly as possible the shaft is to be deepened and connected with the various levels driven into the territory from the Elkton property. The ground at depth has already in this manner been prospected. That ore—and bonanza ore—is there has already been demonstrated, and it is simply a question of doing work enough to make a big producer of the property. There is already some talk that the Tornado may yet rival its big neighbor, the Elkton.

Cripple Creek *Times*: The Gatch Leasing Co., operating the Lost Lillie of the Copper Mountain Co., have struck the Fluorine shoot. At a depth of 150 feet two veins have been encountered, one 7 feet and the other 10 feet in width. Assays from the vein show values from $40 to $350 a ton. The entire vein is pay ore. The leasing company has eighteen months yet to run. Their royalty is from 10% to 20%. A steam plant has been ordered.—— Lessee Brant, operating the Iron King of the C. C. & M. Co. alongside the Hoosier, has the Hoosier vein at a depth of 110 feet. The ore body has been cut for a distance of 10 feet and is not through it.——N. C. Estey of Leadville has taken a three years' lease on the St. Louis and Cripple Creek tunnel on Mineral hill. A large force will be put to work. The tunnel is in a distance of 800 feet. About half way in a 35-foot vein was encountered and it is the intention of the lessee to drift on it in search of the ore shoot.——The Hendrie & Bolthoff Co. of Denver have sold to the Gold Coin mine a Webster, Campbell & Lane first motion double hoisting plant. The engines are 24x48. The plant is equipped with double reels for flat ropes and will hoist a 10,000-pound load 2500 feet at a speed of 1500 feet per minute. The Ajax mine has purchased a similar plant.——Another strike has been made on the Zenobia. It is small, but will run $30,000 to the ton. The strike was made at a depth of 465 feet in a drift from the Garfield Consolidated shaft, in Zenobia ground. The Zenobia shaft is down 425 feet and will be sunk to 465 feet. That part of the property is under lease to Tutt, Penrose & Bartlett. ——It is reported that Boston capital will build a 100-ton chlorination plant at Cameron.

IDAHO.

BOISE COUNTY.

Boise *Statesman*: G M. Cary, owner of the Lion mine, twelve miles from Placerville, says it was discovered two months ago. It shows 3 feet of ore from which an average sample returned 181.77 ounces of silver per ton, $13 22 in gold and 11.64% lead.

IDAHO COUNTY.

Salt Lake *Tribune*: At Marshall lake, twenty-five miles southeast of Florence, on the south side and on the high mountain range, Maxwell & McGibbon located in August the Mountain Chief claim. Ten days ago they went out to do their assessment work. The ledge did not show much on the surface. Several came back and pronounced the camp no good, but Maxwell & McGibbon at 7 feet commenced to find free gold. At 12 feet in depth they found quantities of gold. They brought to Florence a sack of ore that was one-half gold. J. N. Rice, who furnished Mallory $4.75 worth of grub and for which Judge Steele awarded him one-fourth of the Big Buffalo group of mines last July, has secured a bond on the Mountain Chief group for $100,000, one-half to be paid in thirty days —— Parties from Boise basin are here putting in a dredging plant to work tailings of placer days.

MICHIGAN.

HOUGHTON COUNTY.

The Tamarack Co. is contemplating a semi-annual dividend of $5 or $6 per share. Its mineral is running richer, and at present is producing at the rate of 2,000,000 pounds per month.

The new Tamarack-Osceola mill has not yet started up. The mill is awaiting the completion of the 40,000,000-gallon pump.

It is reported from the Victoria mine that a soft epidote has been struck, heavily charged with mass copper, running from one to fifty pounds weight. They are now about 15 feet in on the vein.

Marquette *Mining Journal*: At the Arcadian mill, at Grosse Point, the second head of the mill is running, and both heads are stamping daily 1100 tons. Considerable barrel copper is picked out at the mill which escapes notice at the mine, where the major portion of the barrel rock is sorted. The third head is being placed in position. The anvil block weighs thirteen tons. The 35-ton foundation block and the two 17-ton blocks upon which the anvil block sits are in position.

MISSOURI.

JASPER COUNTY.

The Boston Get There Zinc Co. made the largest return for the week ending October 15th of any of the mines in the Joplin district —272,560 pounds of zinc and 22,320 pounds of lead.

Zinc mines in the Missouri-Kansas district remain closed, but prospects seem to favor early reopening of mines. Prices for zinc and lead remain unchanged. A number of smelters have closed down also, the smelters evidently having determined to combat the Miners' Association for lower rates.

A combination known as the National Lead, Zinc & Spelter Co., with a capitalization of $10,000,000, and with a surplus of $500,000, to control and work large interests in the Joplin-Galena district, has been formed. The concern was promoted by M. Pollasky, president of the National Mine Co., of Kansas City. The concern will operate and develop properties in the district, and as a result of the organization lead and zinc stocks will be listed on the stock exchanges of New York, Boston and Chicago.

MONTANA.

GRANITE COUNTY.

At Philipsburg, P. A. Fusz, through F. D. Brown, has bought for $20,000 all of the placer claims, mill sites and water rights belonging to J. T. Pardee of that city. The properties are patented, together with all the mill sites and water rights, located in Basin gulch.

SILVER BOW COUNTY.

An action has been brought by the Boston & Montana against the owners of the Ella, which was supposed to be Boston & Montana ground, but was jumped by J. R. Bordeaux and others, who have expended their money in opening up the property. Now that the work has developed a mine litigation has begun.

Another mining suit has commenced in Butte, involving the Ella, which has made a fine showing the last few months. The action is commenced by the Boston & Montana Co. and the defendant is the Meaderville M. & M. Co., of which J. R. Bordeaux is the moving spirit. The plaintiff seeks for an order of inspection and survey, and alleges that the defendant is mining and extracting ore from ore bodies of the Ella which have their apexes in the Leonard claim, which adjoins the Ella. The defendant is charged with entering these veins and ore bodies by means of underground workings and extracting ore. For the purpose of determining the truth of this belief the plaintiffs have asked for an order of survey.

Butte *Miner*: Underlying the Harrington placer, the ground which Mr. Heinze seeks to have condemned that he may use it for a dump, it is reported six ore veins had been discovered, and the Butte & Boston is working toward them through the Silver Bow shaft. The ground lies on Meaderville flat and was supposed to be barren.

NEVADA.

ELKO COUNTY.

The Young America M. Co., at Tuscarora, by Mgr. W. B. Andrew, has ordered a mill of ten stamps, with space for twenty to be added next spring, to be followed by a cyanide plant.

LANDER COUNTY.

It is locally reported that mining is to be resumed at the Union mine at Austin.

LINCOLN COUNTY.

Pioche *Record*: W. J. Dooley has bought 812 feet in the Johnny mine, in Stateline district. N. P. Dooley sold 500 feet and C. Robinson 312 feet, Dooley conveying his interest also in the Stateline mill, while Robinson transferred his interests in a number of adjoining locations. C. O. Newell declined to sell his holdings at a $90,000 basis.

NYE COUNTY.

Suit has been commenced in San Francisco, Cal., against W. J. Sutherland, Pres. of the Homes M. Co. of Nevada, by A. H. Ricketts, representing minority shareholders, to prevent the sale of the Homes property and other Nevada mining properties to an English syndicate for $4,000,000. The suit is brought for the protection of the minority shareholders.

STOREY COUNTY.

In the Con. Virginia and California mine a new ore shoot has been found on the 1800 level, which is being developed.

A dozen teams are hauling rock from the Imperial mine to Wheatland, from which place it is shipped to the Stege smelter.

C. E. Dutcher, chief electrician of the Comstock Pumping Ass'n, has returned to Virginia City from a final survey of the route of the pole line from the Comstock to Floriston. The length of the pole line will be twenty-eight miles. Mr. Dutcher says the Truckee River General Electric Co. will be ready to deliver power on the Comstock by June 1, 1900.

The water in the C. & C. shaft has been materially lowered since the re-installation

of No. 2 elevator. The latest official report is as follows:

VIRGINIA, NEV., Oct. 26, 1899.

To Aug. Waterman, Consulted Pumping Assn., San Francisco: At 6:30 this morning the water was 121 feet 3 inches below the 1250-foot level station. No. 2 elevator has been running continually.

JOS. R. RYAN.

NEW MEXICO.

GRANT COUNTY.

Santa Fe *New Mexican*: F. J. Davidson will start the Golden Grant mill at Pinos Altos on ore from the Gopher mine, which employs fifteen men.——The mines and smelter at Pinos Altos recently sold by Dimmick Bros. have suspended operations pending a change of management.——The Pinos Altos G. M. Co. is setting up machinery in the new concentrating plant. The management is also sinking from the 700 to the 800 level in the Gillette shaft, a hoist having been placed on the 700 level to facilitate operations. The company has decided to use coal instead of wood for fuel.——Supt. Brandis of the Atlantic group at Pinos Altos is drifting and sinking winzes from the 600 and 700-foot levels. Fifteen men are employed on development work.——Philips & Adams bonded one of their claims at Ash Peak to a Denver company Oct. 1st. The claim produces ore that runs 900 ounces silver and $295 in gold and copper.——Rodgers & Tong made a strike on the Summit and Commerce at Ash Peak. An assay showed 1652 ounces of silver and some gold. The vein averages 6 feet in width.——The new furnace erected at the Silver City reduction works has increased the capacity of the plant to 225 tons per day. One hundred men are employed.

OREGON.

BAKER COUNTY.

Baker City *Democrat*: A strike has been made in Cornucopia district. Mackay & Dean, in doing assessment work on the Bryan location near the Last Chance—an extension of the Red Jacket—opened an ore shoot that was rich in gold. The pay streak is 1 foot wide.——At the head of Rock creek A. W. Ellis of Sumpter has struck a 20-foot ledge from which ore is being shipped from the surface.——The Chloride, recently purchased by Knoxville, Tenn., people, is being operated.——The Weatherby mining district is in the same mineral belt with the Virtue and Columbia Creek mines. Nearly all the mines are free gold, in granite and slate formations. The gold assays in fineness from $16 to $17.50 per ounce. The Pomeroy dredger is working 30 feet of gravel, averaging 23 cents per cubic yard.——At the Weatherby-Bonanza, owned by a Spokane company, they are preparing to sink a 500-foot shaft.——The Burnt River M. & M. Co. of Walla Walla are erecting a 2-stamp mill.——The Golden Thread M. Co. have a 5-stamp mill and steam hoist which they are putting in place. The property is owned by a Seattle company.——The Gold Cliff M. Co. are shipping to the Tacoma smelter. These properties are within six miles of the O. R. & N. Ry., and are accessible at all seasons.——Supt. Hansen of the Deer Lodge mine, on Rock creek, twenty-five miles west of Baker City, states that work has commenced at the Deer Lodge. The ore assays from $10 to $40 per ton.

Baker City *Democrat*: It is reported that the Bonanza mine, sold a short time ago by the Geisers for $1,000,000 to Pennsylvania capitalists, has been sold for $3,000,000.——E. J. Godfrey, one of the owners of the Red Boy, who has been in London for two months, has placed the Red Boy and North Pole mines at $3,000,000 for the former and $900,000 for the latter.

SOUTH DAKOTA.

CUSTER COUNTY.

Custer *Chronicle*: H. Eisele of Omaha, A. C. Kellar and J. Wallace of Council Bluffs, Iowa, of the North Star M. Co., have been inspecting their property near Custer. Seventeen feet of ore is exposed in the different openings on the property. The company have in contemplation the purchase of steam hoisting works, and air compressor and drills. Mr. Feay is Supt.

LAWRENCE COUNTY.

Pioneer Times: The ore that O. P. T. Grantz took from Deadwood to Denver, Colo., recently from his Hidden Treasure mine near Terraville netted him $79,000.

UTAH.

BEAVER COUNTY.

Salt Lake *Tribune*: There is a representative of a California syndicate in this county who says that within sixty days his people will have 1000 men in the mines and smelters there. This means the purchase and rehabilitation of the two old smelters at Milford; and as the syndicate has secured over fifty claims, they will have considerable territory to operate upon.

JUAB COUNTY.

It is figured that the Centennial-Eureka now shows dividends in sight for the next ten years on a basis of $4 per share per year.

Tintic *Miner*: An interesting apex question has been raised by the Four Aces Co. breaking into South Swansea ground, from which the latter company claims they have extracted considerable ore. Supt. Wheeler and his force came upon the Four Aces miners Tuesday while upraising from the 650 level. He put a bulkhead across the drift.——Mgr. Hunt, of the May Day, will let a contract for a 50 H. P. hoisting plant and an air compressor of 5 drill capacity. A station will be cut in the tunnel 25 feet east of the winze through which the ore bodies have been prospected, where a vertical shaft will be sunk 500 feet. The boilers and air compressor will be housed on the dump.

SUMMIT COUNTY.

The properties embraced within the holdings of the Alliance M. Co., at Park City, have passed into the possession of the Silver King for $65,000. The only thing from which this property has ever derived any revenue has been the water owned by it, although $70,000 has been expended in prospecting it.

WASHINGTON.

FERRY COUNTY.

Spokesman-Review: There is more quartz in sight in the Blacktail than in any other claim in Republic, save the Republic and Mountain Lion. A drift in any direction unearths a body of ore. While there is a quantity of quartz of good value, it is, as a rule, mixed with porphyry, in which large bunches of clean quartz are found.——The shaft on the Knob Hill is down 18 feet in 4 feet of quartz, going $28 per ton. In the tunnel the vein is larger and the values are $36 per ton. The ore to free milling. The property lies a quarter of a mile southeast of the San Poil and a half mile southeast of the Mountain Lion.——Supt. Kehoe of the Bodle says that the shaft is 275 feet deep, with 2 feet of solid quartz in the bottom, which assays $20 per ton. The ledge has been considerably broken, but is solid now.

STEVENS COUNTY.

It is reported that Dr. Grieve, W. R. Hook and R. Roescheisen have struck galena on the west slope of Bossburg hill. The ore is similar to the Bonanza product, but is of higher grade. Considerable galena float has been found by parties in the vicinity of this strike.

OKANOGAN COUNTY.

The Palmer Mountain G. M. & Tunnel Co. was awarded the first prize for the best arranged mineral exhibit at the Spokane Industrial Exhibition.

WYOMING.

CARBON COUNTY.

Grand Encampment *Herald*: The first carload of ore from the Cox mine, shipped to Denver this week, is the richest ever shipped from the Grand Encampment district, running 34% to 79% copper, and will net the company $2400 a car. The mine is thirty-five miles from Battle in a southeasterly direction. The mine is owned by the Wyoming Con. Copper Co. of Boston. They have thirty claims on Big creek, fifteen miles southeast of Encampment. The company is now damming Big creek and is going to put in an electrical plant to develop 300 H. P. Col. Frambach, Pres. of the Wyoming Southern, is interested in the mine.

FOREIGN.

NEW ZEALAND.

Alexandria *Herald*: The several dredgers working in the vicinity of Alexandria during a week in August produced gold as follows: Vincent, 143 oz. 11 dwt.; Matau, 128 oz.; Unity, 74 oz.; Moa, 49 oz.; Nil Desperandum, 49 oz.; Enterprise, 48 oz. 5 dwt.; Chatto Creek, 29 oz.; Manorborn, 24 oz. 10 dwt.; Molyneux Hydraulic, 24 oz; Golden Beach, 22 oz. 9 dwt. 12 gr.; Galtee More, 9 oz.

London *Mining Journal*: From the three centers the output for the month amounts to £51,895 15s 3d, or and increase of £6580 over the corresponding period of 1898. Ohinemuri mines contribute £41,772, Thames proper £6378 and Coromandel £3743.

SOUTH AFRICA.

The output for August on the Witwatersrand was 459,710 ounces, being 3236 ounces greater than that of July. Other South African mines added 22,399 ounces to the above amount, making a total of 482,109 ounces—nearly $10,000,000.

BRITISH COLUMBIA.

A press dispatch from Ashcroft states that there was a robbery on the night of the 18th inst. at the Cariboo mine, near Quesnelle Forks. The safe in the Cariboo Hydraulic Co.'s office was blown open, and part of the amalgam, worth $50,000, stolen.

The Le Roi M. Co. has declared its first dividend since the mine passed from Spokane ownership. The dividend is 5 shillings per share or £25,000, to be paid Nov. 7th. It is also reported from London that the company expects to pay dividends monthly in the future. The changes made in the main shaft have doubled its working capacity. Hereafter, the management states, 400 tons per day will be the output maintained. This does not include 200 tons a day from the second-class ore dump.

The War Eagle has recently showed increase in values. Ore taken out of the stopes at the 250-foot level showed an average value of $90, and there is an average width of 5 feet of this ore.

LOWER CALIFORNIA.

At the Sierra Pintada placers, of a population of the district which at the time of the recent rush was 2000 persons, about 100 are left, and only six or eight Americans, among them being Long and Hatch of Los Angeles, P. Brennan, of the Rice district, San Diego County, Cal., and Cahill, Cunningham and Reece, of Los Angeles, who have filed upon quartz claims rich in copper and gold. The claims are five or six miles from the main camp.

Recently Declared Mining Dividends.

Le Roi M. Co., Rossland, B. C., £25,000; payable Nov. 7.

Montana Ore Purchasing Co., quarterly, $1 per share, $80,000; Oct. 27.

Raven G. M. Co., Colorado, 1 cent per share; payable Nov. 1. Total, $49,500.

Gold King M. Co., Colorado., 3 cents per share; Oct 20.

Boston & Montana M. Co., quarterly dividend, $4 per share, extra $11 per share; payable Nov. 20. Total this year, $36 per share.

Champion M. & M. Co., Nevada City, California, 25 cents per share, $8000; payable Nov. 1.

Personal.

LOUIS JANIN has returned from Utah to San Francisco.

J. H. TIBBETTS has returned to San Francisco from Nova Scotia.

JULIAN SONNTAG has returned to San Francisco from an extended Eastern visit.

COL. MANSON of Reno is secretary of the Paris Expcsition Commission for Nevada.

CECIL RHODES says that mining and fighting will proceed simultaneously in South Africa.

EDGAR RICKARD, late Supt. Moon-Anchor mines, Colorado, has resigned his position and gone to London.

PROF. CHAPMAN of Adelaide, Australia, is in San Francisco on an itinerary through the principal gold mines of the country.

SAM'L J. HENDY, of the Joshua Hendy Machine Works, has returned to San Francisco from a business visit to the Atlantic slope.

H. Z. OSBORNE of Los Angeles, Cal., is attending the eighth annual convention of the California State Miners' Association at San Francisco.

HERMAN ZADIG has returned to San Francisco, Cal., from an official inspection of work in progress on the Brunswick lode at Virginia City, Nev.

WM. B. FISHER of San Francisco has been appointed Gen. Mgr. American Zinc, Lead & Smelting Co., with future headquarters at Joplin, Mo.

J. R. TOOLE, of Butte, Montana, recently returned to that city from an extended tour in Mexico and British Columbia in search of mining property.

N. E. IMHAUS, Mgr. Flagstaff mine, Baker City, and H. S. Ankeny, of Portland, are in San Francisco attending the meeting of the California Miners' Association.

W. R. WHEELER of San Francisco has been selected by the Pacific Coast Manufacturers' and Jobbers' Association to fill the vacancy on the Interstate Commerce Commission.

WAKEFIELD BAKER AND H. D. LOVELAND, of San Francisco, have been respectively elected president and traffic manager Pacific Coast Jobbers' and Manufacturers' Association.

THOS. TONGE, of Denver, represented Colorado at this week's San Francisco session California State Miners' Association, and will report his impressions thereon to the Denver dailies.

J. H. HARRIS, Mgr. Reco M. Co., Sandon. B. C., will spend the winter at his home in Virginia. He says no attempt will be made to reopen the Slocan mines until the labor question is settled.

H. T. WILLS, Mgr. Canadian Bank of Commerce of Dawson, has returned. Within a period of sixteen months, since that institution began doing business in Dawson, he has purchased about $7,000,000 worth of Klondike gold.

URIAH DUDLEY, of Melbourne, Australia, arrived in San Francisco this week on an extended tour of observation of California mines. Mr. Dudley is the founder of the Society of Australian Mining Engineers, and will spend considerable time in this country in noting conditions and methods of practical mining.

JOS. MCGILLIVRAY, the veteran California miner, arrived in San Francisco this week from his second visit to the Klondike. He starts to-day on his third visit to London via Ottawa, Canada, and expects to return to Dawson City via San Francisco next February. At present he has three sets of engineers at work and is negotiating an operation that involves the investment of $2,000,000. He is backed by British capital, and though in his seventy-third year, looks upon a little trip to the Yukon metropolis as a mere incident in the transaction of his mining business.

Industrial Notes.

—Nearly 500 miners are now employed in the Mogollon, New Mexico, district.

—A long-distance telephone is to be put in from Dawson to points down the Yukon river. Ultimately Circle City will be reached, but for the present the lines will not go below Fort Egbert.

—The Pacific Coast Co. announced a rise in wages of from 12½ to 15% of all the men employed in the coal mines at Newcastle, Coal Creek, Lawson and Franklin, Wash., in all about 1200 people.

—The new mills of the Bellingham Bay, Wash., Improvement Co. are to have the largest steam whistle in the world. It will be 5 feet long, 15 inches inside diameter, will weigh 1300 pounds of cast aluminum bronze. The metal must have a tensile strength of 60,000 pounds per square inch to meet the stipulations. It will take considerable of a boiler to furnish steam of commensurate requirements.

—The western section of the Transvaal Railroad consists of a line from Cape Town to Mafeking. The midland section consists of a line from Port Elizabeth to Norval's point, on the Free State frontier, where it connects with the Orange Free State trunk line, running through Bloemfontein to the Transvaal. The western section is connected with the midland by a line from De Aar to Naaupoort Junction, sixty-nine miles long.

—An American engineer is en route to China on behalf of Chicago men, on whose behalf he expects a share in the expected contract to be given out by the Chinese Government for the demolition of the famous Chinese wall. It is stated that one French, two British and three German firms are also bidding for the work, payment for which is to be ample in the shape of rich concessions, so that out of the ruins of the wall there may arise great engineering and industrial works which may change the whole future of China.

—Business is not all a matter of barter. There is more that goes out to a customer at each transaction than the goods and invoice, and more is received from him than the orders and payment, and this incorporeal seasoning of personality that permeates trade is what gives to it its savor and lifts it above the drudgery of mere money grubbing. Man does not work for wealth alone. In fact, there arises a time in the career of almost every successful man when the money that is made is a minor consideration, and in proportion as he gives his time and energy to his business does he value the other things he gets out of it, which his devotion to it prevents him from seeking elsewhere; and so the friendliness injected into his commercial relations means much to him. It is the letters that praise the goods of a house, that comment favorably upon some phase of its policy or that contain evidences of personal esteem, that are read and re-read by all from the head down, are passed from hand to hand with expressions of appreciation and are finally most carefully filed. So, too, when by any chance the heads of the businesses meet, the cordiality that is displayed has its origin in the esteem gained from association, lying far deeper than any mere monetary consideration involved in the trading done.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 17, 1899.

635,069.—LIFE PRESERVER—Z. C. Angevine, Los Angeles, Cal.

635,009.—DISH WASHER—J. D. Atkinson, Seattle, Wash.

634,978.—WATER TUBE BOILER—M. P. Boss, S. F.

635,037.—TRUCK—C. A. Buck, S. F.

635,230.—BUCKLE—O. K. Burnham, Palouse, Wash.

635,234—STOOL SEAT—G. H. Chance, Portland, Or.

635,127. — FLUID-CONTROLLING MECHANISM — C. Cummings, S. F.

635,011.—CRUSHING MILL—J. M. Dyer, S. F.

635,012.—SAFETY GAS COCK—H. H. Fassett, S. F.

634,982.—INSUFFLATOR—E. T. Johnson, S. F.

635,049.—JAR CLOSER—L. Look, Dos Angeles, Cal.

635,264.—GRAIN HEADER — J. C. Lynch, Walla Walla, Wash.

635,177. — CONVEYOR — W. L. McCabe, Tacoma, Wash.

635,176—FILLING FOR WOOD PAVEMENTS.—T. K. Muir, Portland, Or.

635,270.—DREDGER—Rix & Donahoo, S. F.

635,000.—ENVELOPE FASTENER—C. P. Schademan, Congress, Ariz.

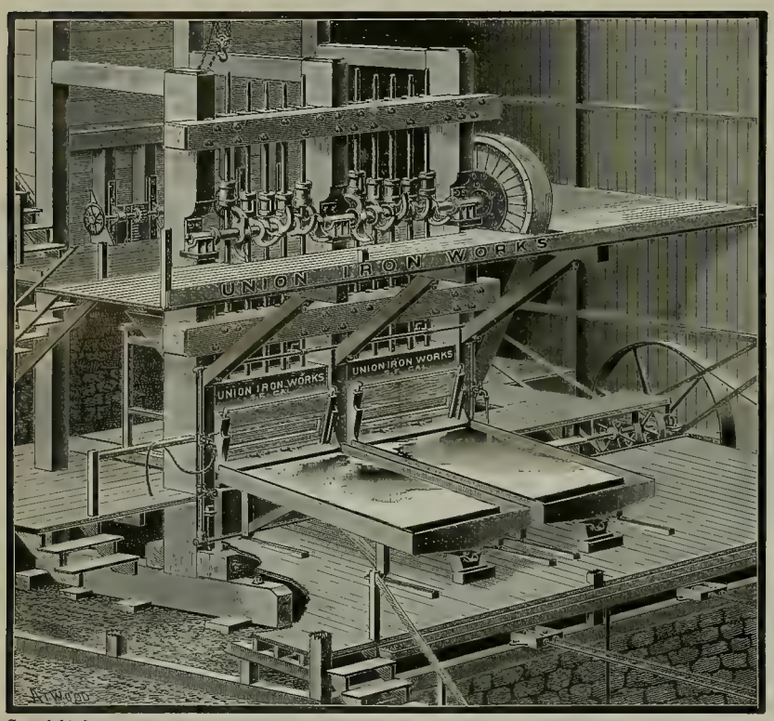
634,934.—SWING—W. S. Young, Artesia, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAFETY GAS COCK.—H. H. Fassett, San Francisco, Cal. No. 635,012. Dated Oct. 17, 1899. The object of this invention is to prevent the escape of gas and the danger arising therefrom if the gas cock is accidentally turned back after the gas has once been turned off. The invention consists of an elastic wavy outlined spring fitting circumferentially in a case or enclosure surrounding and concentric with the axis of the gas cock. A pin projects from the cock in line with the spring and forms contact with each of the raised portions of the wavy outline as it passes, and when it is left at the point where it is either closed or opened it is practically locked between two of these raised portions of the spring, so that it cannot be turned from its position without the exercise of considerable force. When sufficient force is applied the elastic nut of the spring causes it to yield so that the point of the pin will pass these raised portions of the spring.



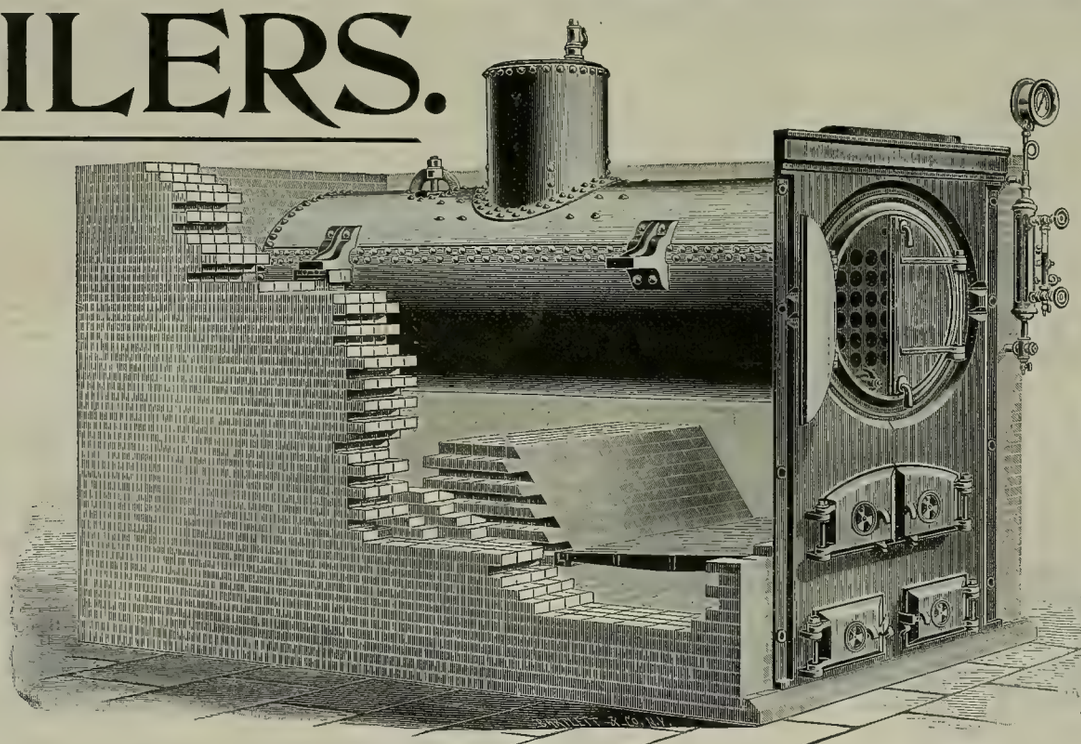
CONTROLLING MECHANISM FOR FLUIDS AND GASES UNDER PRESSURE.—Charles Cummings, Oakland, Cal., assignor to the Pneumatic Power Co., San Francisco, Cal. No. 635,127. Dated Oct. 17, 1899. This invention relates to improvement in valves used in pipes for conveying fluids or gases under pressure. In operating machines by fluids or gases under pressure a main pipe or conductor extends from the source of power to the point or points where it is desired to apply it. Small pipes connect this main with the motors to be actuated and any number may be independently connected in this manner. The object of this invention is to provide for closing the connection between the main and any one of these small pipes in case of fracture of the pipe or other accident which would otherwise cause a loss of the fluid under pressure. This is particularly valuable where the main carries a fluid under a high pressure and in cases where the gas or fluid is circulated in a closed system at two unequal pressures. The invention consists essentially of an automatically operating valve interposed between the main and supplemental conducting pipes, the piston mounted upon the valve stem and movable in a cylinder, one end of which is open to pressure from the passage between the two pipes and the other to atmospheric pressure.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

BUILD THIS

MODERN TEN-STAMP BATTERY.



Copyrighted.

The illustration shows the details of a modern 10-stamp battery of the back-knee type, driven by belt and tightener from a shaft located upon the battery frame sills below the mortars and plainly illustrates not only the battery and its various parts, but also shows the ore-bin gate, feeders, copper apron plates and water piping, all in their relative positions.

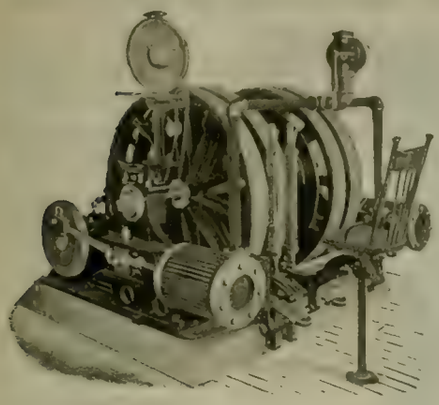
SEND FOR CATALOGUE No. 5.

BOILERS.

"STANDARD" TUBULAR STATIONARY BOILERS.

Our "Standard" boilers are made of "Best Flange" Open-hearth Homogeneous Steel Plate, of 60,000 pounds tensile strength. This steel will turn over and close down solid without fracture, when cold, or after heating and cooling in water, and will not blister.

In all sizes up to and including No. 17, the bottom of the boiler will be without seams, except around the heads.



The great advantages of a boiler made in this way are apparent; the bottom presents a smooth, even surface, which prevents lodgment of sediment and burning of plates.

The longitudinal seams of the shell are double-riveted, and the domes of No. 4 and larger sizes double riveted to boiler. The edges of the plates are planed, and the calking is done by Connery's patent concave system.

Special attention is given to the bracing, which is a most important item in boiler construction, and enough braces used to insure a large factor of safety.

BAKER & HAMILTON,

SAN FRANCISCO, SACRAMENTO, LOS ANGELES.

Have you ever used a Friction Hoist? They are exceedingly popular where best known.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

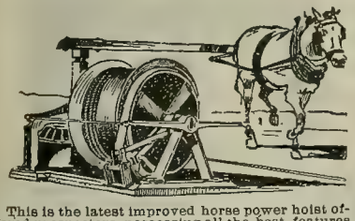
Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

"The Proof of the Pudding is in the Eating."



Something over a year ago, two of these Richards' Patent Triple Plunger Pumps, with motors as shown, were supplied to a mine in Mexico, for the purpose of raising water to an elevation of 650 feet. The owners were so well pleased, that they ordered another of the same a few months later. These pumps were arranged with outside packed plungers, for pumping muddy water — designed for that purpose, they did it satisfactorily.

For all purposes where a uniform resistance to the driving motor is a consideration, these pumps are admirably adapted. Triple Plungers and crank shafts run in a bath of oil if desired. Made with large valve areas, and by actual test develop a very high efficiency. Furnished with or without motors, or for use with gas or steam engine.

This is only one of over fifty different kinds of pumps we make.
Our 1899 Catalogue tells all about them; sent on application.

The Bleichert Wire Rope Tramway,

AND OTHER SYSTEMS OF AERIAL TRANSPORTATION,

MANUFACTURED BY

The Trenton Iron Co., TRENTON, N. J.

Engineers and Contractors, and sole licensees in North America for the Bleichert System.

Also, Wire Rope Equipments for Surface and Underground Haulage, etc.

NEW YORK OFFICE—Cooper, Hewitt & Co., 17 Burling Slip.
CHICAGO OFFICE—1114 Monadnock Building.

BLEICHERT TRAMWAY AT THE CHILKOOT PASS.

For Particulars, Address

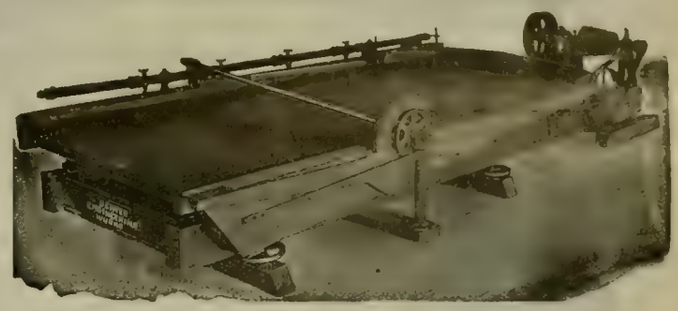
Newton M. Bell, Agent,
109 CALIFORNIA ST., SAN FRANCISCO.

A full stock of the Trenton Iron Co.'s Wire Ropes, made from "SPECIAL" Crucible and Plough Steel, carried in San Francisco.

THE RISDON HAMMERED SHOES AND DIES

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

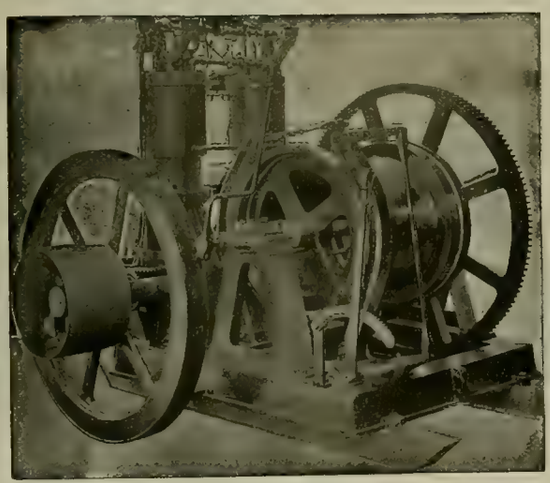
THE RISDON IRON WORKS, SAN FRANCISCO.



THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : :



The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : : :

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

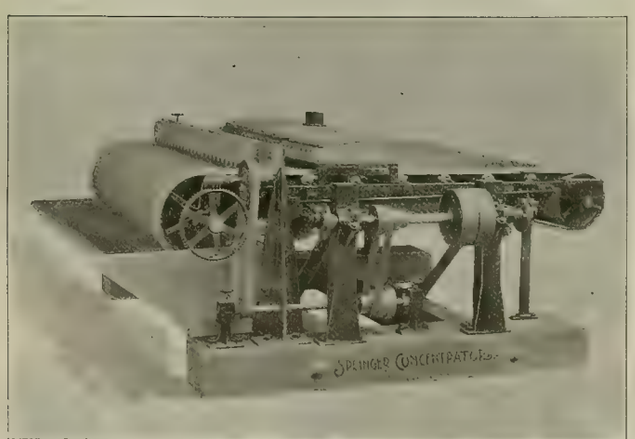
BOILERS, ENGINES, STEAM HOISTERS, ELECTRIC HOISTERS, ROLLS, CRUSHERS, WILFLEY TABLES, CARS, CAGES, ORE BUCKETS, RAIL, PIPE, FITTINGS, BELTING, ETC., ETC.



GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: GATES IRON WORKS, Dept. UU, 650 Elston Ave., CHICAGO.

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see this Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to

AMOS C. SPRINGER,
976 PINE STREET.....SAN FRANCISCO, CAL.

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

PARAFFINE PAINT CO.,
San Francisco,

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

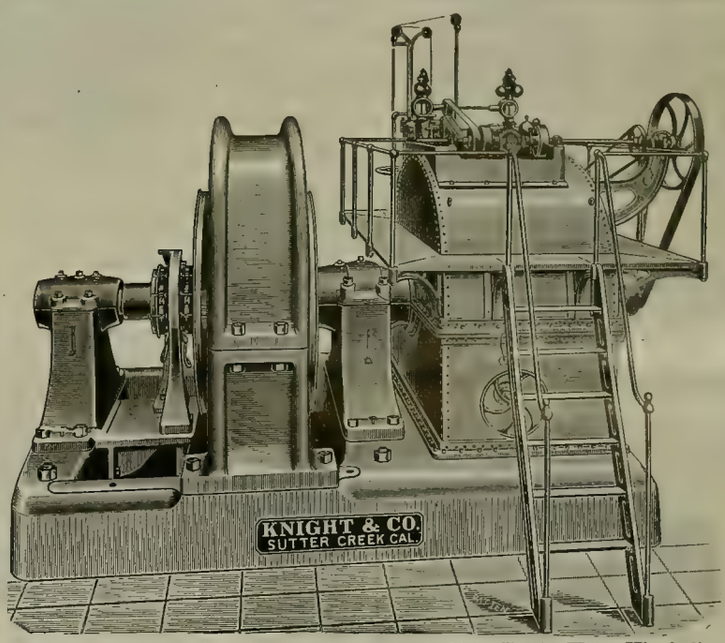
THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.



ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

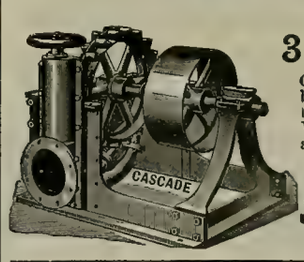
121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of **The Knight Water Wheel**, direct coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing. These wheels are designed for **100 to 2500 H. P. Highest efficiency and regulation guaranteed.**

WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.

Wheels for mill and reversible hoisting works a specialty.



KNIGHT & CO., Sutter Creek, Cal.

Market Reports.

SAN FRANCISCO, Oct. 26, 1899.

SILVER.—London, 26⅝d; New York, 57⅞; San Francisco, 57⅞; Mexican Dollars, 47½@48⅛; New York exchange, sight, 12½; telegraphic, 15 cents premium.

Silver is weak and somewhat lower in London.

LEAD.—New York reports quiet, $4.60 bid, $4.65 asked; brokers' price, $4.40.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6¾c.

COPPER.—New York reports Lake very quiet at $17.75; brokers' price, $17.75. Local—Mill copper plates, 23¾c.

Copper is showing a lower tone, selling under 18 cents for the first time in several months, although there is stated to be decrease in the visible supply. United States production of copper (long tons) for September, 1899, aggregated 22,715 tons, compared with 22,686 tons for the previous month. Exports of copper from the United States (long tons) for September, 1899, aggregated 7553 tons, compared with 10,920 the previous month. European copper production (long tons) for September, 1899, aggregated 7839 tons, compared with 7292 the previous month. Visible supply of copper in London Oct. 15th, 26,164 tons—a decrease of 2164 tons since Oct. 1st. Visible supply Jan. 1, 1899, was 27,896 tons; Feb. 1st, 26,015; March 1st, 24,326; April 1st, 28,497; May 1st, 26,529; June 1st, 30,156; July 1st, 29,004; Aug. 1st, 33,019; Sept. 1st, 32,381; Oct. 1st, 28,328. Supplies for the fortnight, 8670 tons, of which 700 were from Chili and 4954 from America; deliveries, 10,834 tons. The decrease in the visible supply the last six weeks, or since Sept. 1st, amounts to 6217 tons.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

The *American Manufacturer*, in to-day's issue, says: "It is understood that the mills manufacturing steel rails combined and notified the railroad interests of the country that prices would be advanced and that the railroads could cover all their wants at $33 per ton. Nearly every railroad in the country came in with orders, and an aggregate of 1,500,000 tons of rails was ordered at the above price for delivery in 1900. The price was then raised by rail makers as follows: For standard sections, in lots from 100 to 200 tons, $37; carload lots, $38, and less than carload lots, $40; light rails, from twenty-five to fifty pounds per yard, $37 per ton. All the prices quoted are free on board Pittsburg mills. The importance of this can scarcely be realized. The total sales aggregate about $50,000,000. This means that about one-sixth of the total steel output for 1900 will be consumed in the manufacture of rails. This does not include orders placed by the Russian Government some time ago, together with other orders, which will make the aggregate tonnage in rails next year much more than has already been ordered. This fixes it beyond all peradventure that prices of iron and steel for 1900 will be considerably higher than prevailing figures."

STEEL.—11¼@20c per pound.

TIN.—$31.50 bid and $31.65 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $47; export, $43@43.50; carload lots, special rates.

Within the week quicksilver has taken another upward step, export metal being quoted $1 per flask higher than a week ago. The visible supply of quicksilver in this country is between 3000 and 4000 flasks, or less than a month's requirements. The visible supply abroad is less than one-half the amount normally on hand. Prospects favor a still further advance in the near future. Quicksilver is not sold for future delivery, all sales being made for cash and spot delivery.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

PLATINUM.—London, 66s per ounce; New York, $17.75; San Francisco, $17.25.

ZINC.—$5.15 bid, $5.25 asked.

There is a noted feature in zinc—its perishability. After a ton of iron or copper or silver or gold is produced it is practically indestructible. The world's supply of the metal is increased by just that amount, less the natural waste and wear and tear. Convert copper into electric wire, and it is permanent. Should it pass through the fire the copper is simply melted and can be recovered. Zinc, on the contrary, is volatile. It is obtained from the ore by vaporization and subsequent precipitation. Put it in the fire and it is gone forever. Used in electric batteries it is eaten by acids. When used for gold extraction it disappears. As surface for galvanized iron it cannot be recovered. Hence the world is dependent upon the annual supply of the metal. There are no accumulated stores, so that however high the price may go it is not possible to work over old metal, as in the case of almost every other metal.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15¾c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c ₱ lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5½@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¼@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.20; less than 200 gals., $1.25; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 56c; cs., 66c; raw, bbl., 54c; cs., 59c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 19c; Astral, 19c; Star, 19c; Eocene, 21c; Extra Star, 23c; Elaine, 24c; Water White, bulk, in tanks, 13c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c.

CANDLES.—Electric Light Candles—6s, 16 oz., 8½c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5½c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8½c; 6s, 12 oz., 7¼c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

Assessment Notices.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of October, 1899, an assessment (No. 9) of ten (10) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of November, 1899, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 21st day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California. Office hours from 1 to 3 P. M.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 27th day of September, 1899, an assessment (No. 13) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1899, an assessment (No. 33) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, 10th floor Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 31, 10th floor Mills building, San Francisco, California.

ANDES SILVER MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of October, 1899, an assessment (No. 49) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of November, 1899, at 1 o'clock P. M., to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

OSCEOLA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of October, 1899, an assessment (No. 8) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 307 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of November, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of December, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

HOLLAND SMITH, Secretary.

Office—307 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California. location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No 30) levied on the 16th day of September, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No Cert.	No. Shares.	Amt.
G. A. Hinckelbein, Trustee	9	1,000	$50 00
G. A. Hinckelbein, Trustee	10	1,000	50 00
G. A. Hinckelbein, Trustee	11	1,000	50 00
G. A. Hinckelbein, Trustee	32	200	10 00
P. A. Wagner, Trustee	90	980	49 00
P. A. Wagner, Trustee	91	1,000	50 00
P. A. Wagner, Trustee	92	1,000	50 00
P. A. Wagner, Trustee	93	1,000	50 00

And in accordance with law, and an order from the Board of Directors, made on the 16th day of September, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 217 Sacramento St., San Francisco, California, on WEDNESDAY, the 15th day of November, 1899, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CHARLES BOVONE, Secretary.

Office—217 Sacramento St., San Francisco, California.

Notice of Application for Dissolution.

In the Superior Court of the City and County of San Francisco, State of California.

In the matter of the application for the dissolution of the corporation named, THE GRASS VALLEY WATER COMPANY. Dept. No. 2. No. 70,052.

Notice is hereby given that said corporation, THE GRASS VALLEY WATER COMPANY, on October 17th, 1899, made a voluntary application for dissolution, in writing, to said Court;

That said Court thereupon on said 17th day of October, 1899, made an order directing that said application be filed with the Clerk of said Court, and that said Clerk give thirty-five (35) days' notice of the application by publication in the newspaper named, "Mining and Scientific Press," the same being a newspaper published in said City and County, and that this notice is now given, and will be published according to said order in said newspaper, "Mining and Scientific Press," during the period of thirty-five (35) days from and after the 20th day of October, 1899, the first publication being made on Saturday, October 21st, 1899.

Given under my hand and the seal of the Superior Court of the City and County of San Francisco, State of California, this 17th day of October, 1899.

W. A. DEANE,
County Clerk.
[SEAL] By E. M. THOMPSON,
Deputy Clerk.

Notice of Application for Dissolution.

In the Superior Court of the City and County of San Francisco, State of California.

In the matter of the application for the dissolution of the corporation named, NORTH STAR MINING COMPANY. Dept. No. 2. No. 70,053.

Notice is hereby given that said corporation, NORTH STAR MINING COMPANY, on October 17th, 1899, made a voluntary application for dissolution, in writing, to said Court;

That said Court thereupon on said 17th day of October, 1899, made an order directing that said application be filed with the Clerk of said Court, and that said Clerk give thirty-five (35) days' notice of the application by publication in the newspaper named, "Mining and Scientific Press," the same being a newspaper published in said City and County, and that this notice is now given, and will be published according to said order in said newspaper, "Mining and Scientific Press," during the period of thirty-five (35) days from and after the 20th day of October, 1899, the first publication being made on Saturday, October 21st, 1899.

Given under my hand and the seal of the Superior Court of the City and County of San Francisco, State of California, this 17th day of October, 1899.

W. A. DEANE,
County Clerk.
[SEAL] By E. M. THOMPSON,
Deputy Clerk.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POST-PAID. Following is a partial list:

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 130 pages, illustrated....$1

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. Well illustrated. Cloth.....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. M. C. Ihlseng. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated.....$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall.....$2

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition, just out. By H. S. Osborn.....$1 50

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus.....$3

MINERALOGY:
Brush & Penfield, revised edition.....$4
Dana, New System.....$12 50

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

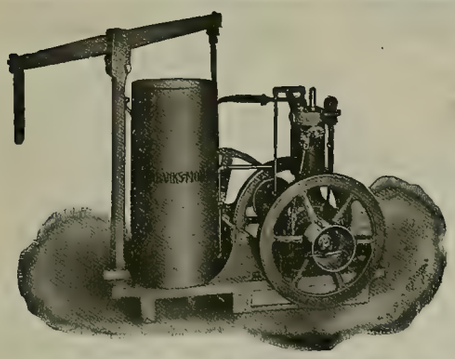
All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages.



SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY. Send for Ropeway Pamphlet No. 20.

Cableways, Double Rope Tramways, Wire Rope Transmissions, Incline Planes, Logging Machinery, Suspension Bridges,

DESIGNED, FURNISHED, ERECTED. Write for Estimates.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

"JACK OF ALL TRADES" is provided with Walking Beam (with 5, 8 or 10-inch stroke), Belt Pulley, Torch Igniter, Electric Igniter, Battery and Cooling Tank. Can be lifted by four men.

FAIRBANKS-MORSE

"JACK OF ALL TRADES."

A complete Engine of 1½ Horse Power, which will give excellent results with either gasoline or distillate. Powerful, compact and easily handled. Can be useful on every mine.

SEND FOR SPECIAL CATALOGUE.

FAIRBANKS-MORSE GASOLINE ENGINES.

ALL SIZES UP TO AND INCLUDING 54 HORSE POWER.

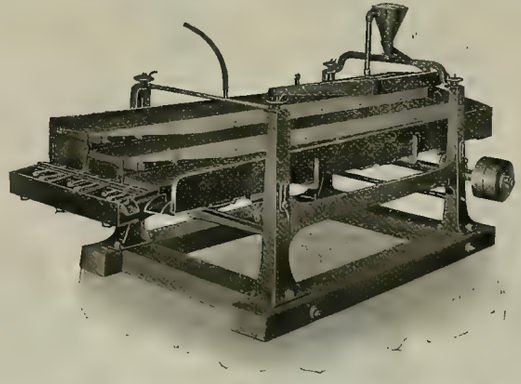
FAIRBANKS, MORSE & CO.,

310 Market Street, SAN FRANCISCO, CAL. 201 N. Los Angeles St., LOS ANGELES, CAL.

CORRESPONDENCE SOLICITED.

THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.



Separates ALL the minerals from each other at one operation.
Gives THREE CONCENTRATES on the one Machine at the same operation.
The Machine is especially adapted to the separation of Zinc and Lead.

- PRICE: -

12-ft. Table, $350.

SHIPPING WEIGHT - - - - - 2200 POUNDS.

CAPACITY - - - 10 to 30 tons per 24 hours.

Parties desiring tests made can send 500 lbs. or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed $10.00.

CAN BE SET UP ANYWHERE.

REQUIRES NO SPECIAL FOUNDATION.

No. 2052.—VOLUME LXXIX. Number 19. SAN FRANCISCO, SATURDAY, NOVEMBER 4, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A 130 H. P. "Union" Mining Hoist.

The accompanying illustrations show the latest development in gasoline hoisting engines. It consists of a four-cylinder vertical gasoline engine of 130 H. P. combined with a double-drum geared hoist, intended to work down to about 2000 feet. It was built for the Yellow Aster M. & M. Co. of Randsburg, Cal., by the Union Gas Engine Co. of San Francisco.

Front View.

The hoist is to be placed under ground about 350 feet from the mouth of the tunnel, at the head of an inclined double-compartment shaft.

It is arranged to start the big engine with a small auxiliary engine, the latter being used also for running the blower for ventilating the mine. Both engines run on distillate, which is about one-half the cost of gasoline when delivered at the mine; but they can be run on naphtha, benzine, or any grade of gasoline.

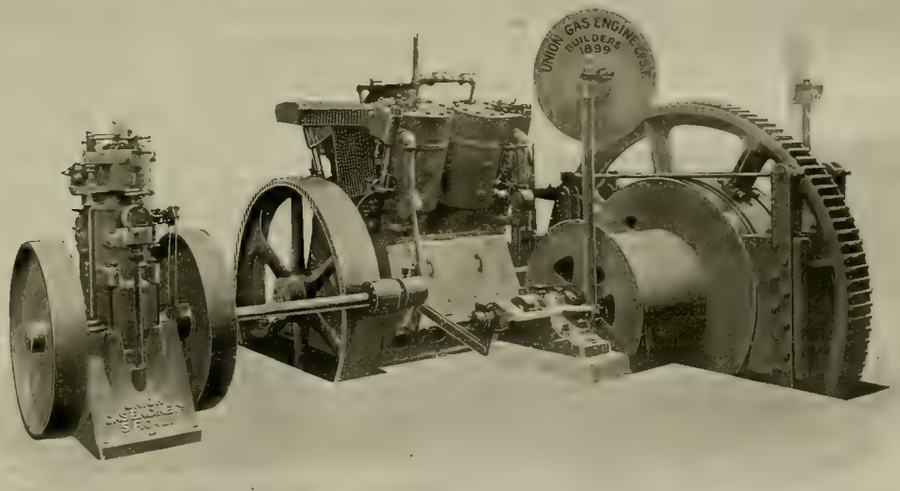
The levers are all brought to one platform, enabling the engineer to have full control over both hoist and engine, as in modern steam practice.

The double-cylinder and four-cylinder engines are particularly well adapted to hoisting purposes, as they have more frequent impulses than single-cylinder engines, and as each impulse is of smaller volume and force, the result is that the load is lifted more steadily.

The Yellow Aster M. & M. Co. have been using one of the "Union" hoists for the past two years, and were so well pleased with its work that they ordered from the same company the hoist of 130 H. P. The Union Gas Engine Co. make a specialty of gasoline mining hoists and engines, which they have been building for the past fifteen years.

They recently closed a contract with the Arizona Copper Co. for two horizontal stationary engines of about 150 H. P. each, which are to operate on distillate or producer gas. One is to run the air compressor and the other the new concentrating plant.

It is not always the mine making the largest output that pays the largest dividend, though it may be best for the greatest number of people.



Promoting Mining Enterprises.

An exaggeration of the facts when presenting a mine or a prospect for sale seldom accomplishes the desired result, and often has a reactionary effect when the misrepresentation is discovered. In these days little or nothing is taken "for granted," as was often the case in former years, and now in order to interest capital a mine owner must have a property worthy of the necessary investigation, to say nothing of a possible subsequent investment. Realizing this, the claim owner, in his anxiety to proffer something attractive to the possible investor, and knowing perhaps that his property does not possess all the merits of a bonanza, is led to place exaggerated values on his ores and the greatest width of vein becomes its average width. All the disadvantages are suppressed as far as possible, while such favorable conditions as do exist are magnified to such an extent as often to lead to a suspicion that the truth is not given due consideration, often to the ridicule of the entire proposition. It is not an easy matter to sell poor property of any kind, and misstating the facts seldom affords a remedy, for in the event of an investigation by competent persons these facts are sure to be discovered. A well-known American expert once remarked: "When I go to examine a mine I usually ask the foreman or superintendent—with a wink—to show me where his best ore is, which he invariably does, and then I find the poor places myself."

While the prospector usually is on the bull side in a deal for his property, he sometimes underestimates its value. A well-known mine was discovered and worked in a shiftless fashion by the discoverer, who one day had an offer of $12,500 for it. He promptly accepted the offer, and, upon receiving his money, crossed the street to where a friend was standing and remarked: "Thank God, the fools are not all dead yet." "How's that?" inquired his friend. "I've just sold the D—— mine for $12,500." This mine has since produced more than $5,000,000.

What a contrast between this man and the Siskiyou Co., Cal., "mine superintendent" who recently remarked that he had in his property 45 feet of ore. His listener, who was acquainted with the facts, inquired in astonishment where it was. "Why," was the reply, "we have thirty claims with a foot and a half of ore in each."

The secret of successful mine promotion lies in a careful selection of property worth all that is asked for it, and such a mine will practically sell itself. No amount of misrepresentation will give value to the property, and its proximity to other valuable and producing mines is given but passing consideration unless it be known that the ore shoots of the working mines actually pass their end lines and enter the property offered for sale, and even then unless the ore shoots be developed the value is wholly speculative and not given more than nominal credit by the investor. Still in the face of these facts promoters continually magnify the value of adjoining property, and in the glittering prospectus make prominent passing reference to valuable mines which chance to be in the same county or perhaps the same State. Such methods are particularly resorted to when the property offered for sale has little merit of its own to recommend it, but the time has come when such representations and misrepresentations are measured by their proper worth.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Front and Back Views of the Largest Gasoline Mine Hoist Ever Built, 513. Working on a Grub Stake; A Home-Made Mill Test, 516. Latest Mining and Metallurgical Patents, 518-519. Browne's Vacuum Bailing Tank, 520.

EDITORIAL.—A 130 H. P. "Union" Mining Hoist; Promoting Mining Enterprises, 513. The Concentration of Ores; Real vs. Bogus Mining Experts; Miscellaneous, 514.

MINING SUMMARY.—521-522-523.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 538.

MISCELLANEOUS.—Concentrates, 515. Notes on Mine Surface Sampling; Put the Blame Where it Belongs; Typical Prospecting Scenes; Copper in South Africa, 516. Notes on the Ymir Mine and Its Mill Practice; Soda Nitrate in Chile; Cyaniding Prior to Amalgamation; The Use of Charcoal in the Cyanide Process, 517. Latest Mining and Metallurgical Patents, 518. Notes on the Geology and Mineral Deposits of Vancouver Island; Mining Operations in the Yukon Basin; A Valuable Publication, 519. Browne's Vacuum Bailing Tank; Grading Near the Smelter of the Golden Reward Con. M. Co.; Warming Quartz Mills and Battery Water; What Many Men Constantly Say, 520. Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Commercial Paragraphs; Books Received, 524. Expected Meteoric Shower; The Arch Principle in Dams; Experiments in Wireless Telegraphy, 525.

THE war now raging in South Africa is attracting the attention of the entire world. As was supposed, England, being unprepared, is meeting severe reverses, but that she will ultimately be the victor few doubt. Upon the issue of this conflict depends the future prestige of Great Britain, not only in South Africa but in the entire world.

ALREADY it is being said that there are not nearly enough provisions at Cape Nome to feed the 4000 people now there during the coming winter, the greater number of whom will be unable to get away owing to lack of transportation facilities. A large number have gone to the Klondyke to winter, as in that district work may be obtained in the underground mines throughout the winter season.

IT is announced that the Federal troops which have been doing duty at Wardner, Idaho, since last spring are to be withdrawn by the order of Secretary Root, although Gov. Steunenberg has strongly objected to it. It is claimed that everything is peaceful in the Cœur d'Alene district and that there is no further need of the military. This the Governor denies. If the troops are withdrawn the real condition existing in that district will soon become apparent, whatever it may be.

IN the summer of 1898 the discovery of large and rich veins of gold ore was announced in the Buffalo Hump region of Idaho. During the following fall and winter much was said of these prospects, and on several occasions they were announced sold or bonded—once to Clark and Sweeney for $550,000, who later gave up the bond—and then it was reported that Capt. J. R. DeLamar had bought the property for a large sum. Later this bond was also given up. Now the announcement is made of another deal on a basis of $200,000, in which Clark and Sweeney again figure prominently. During all this time a shaft 80 feet in depth, with a drift and crosscut at the bottom and a number of small open cuts along the surface, constitute all the development work accomplished on the Big Buffalo mine in nearly a year and a half. The Buffalo Hump is isolated and difficult of approach, but its situation is not without precedent. The Homestake mine in the Black Hills was discovered in 1876; and although nearly 300 miles distant from the nearest railroad, and notwithstanding the route lay through a hostile Indian country, mills were erected and the bullion output had commenced within a year of its discovery and has never since ceased, though the ore did not even at that time average more than $6 per ton. This is a single instance; many others might be cited. The owners of the Buffalo Hump mines evidently believe there is more money to be made by making haste slowly.

The Concentration of Ores.

A Colorado mill man, speaking of the low-grade ores of that State, such as are found in Boulder and Gilpin counties, says that in his opinion no improvement over existing methods employed in the district are needed.

"Concentrating," he says in the Ward *Miner*, "to make a clean product, regardless of making a close saving, secures all the values that can be easily and cheaply had by concentration, and the use of cyanide for the final treatment will in nearly all cases get from 95% to 99% of the values. Clean concentrates are a very desirable product for the smelters, and I have no doubt they will do all they can to encourage this system of milling. There is no excuse now for any good and well located concentrating mill standing idle. The addition of a cyanide plant fills the missing link. We have made very extensive tests on this line here in Boulder county, and always with first-class results. It is very safe to say that any method that will handle Boulder county ore will answer for any other ores produced in this State. Our tests show that with a well-equipped concentrating mill and cyanide plant of fifty tons per day capacity low-grade ore can be converted into money at an expense not exceeding $1.50 per ton. In the two operations of concentrating and cyaniding nearly full assay value is saved. This $1.50 per ton will include the expense of shipping and smelting charges on the concentrates."

In some ores the heavy sulphide material does not carry the highest value, the gangue being richer than the concentrates, but such instances are comparatively rare. There are mines, too, wherein are found both high-grade and low-grade sulphides, and unless these can be distinguished and separated in the mine the low-grade material will be saved on the concentrators, together with the high-grade, reducing the average value. If the lower grade sulphide contains sufficient value to pay for treatment at the mine, or for treatment at the smelters, it makes no difference, but, not containing such value, the low-grade material should be separated, if possible, from that containing the high-grade. Where there are two clearly recognized classes of ore occurring in a mine, each of different character and value, and where each can be easily mined separately, their treatment in separate batteries would give better results than if these ores of differing material or value were mixed and worked together.

There are, however, few mines where the ores, having sufficient value to pay for the cost of mining and milling, and containing sulphides as well, do not justify concentration, and as, in the greater number of such cases, the sulphides contain higher value than an equal weight of gangue, clean concentration is desirable, for the reason that an admixture of the relatively worthless sands reduces the grade of the concentrates, and transportation and reduction charges have to be paid on a quantity of material containing no value, or at least a value below the cost of transportation and treatment.

It is true, concentration may be carried mechanically beyond the limit of economy, and when the point is reached where closer concentration does not result in profit it should cease.

Sorting by hand is a rude concentration and should be regulated by the result. If the silicious portion is susceptible to profitable treatment at the mine, it should not be sent to the smelter, where the cost of transportation and treatment is higher. On the other hand, if the cost of more closely hand sorting this ore is greater than the cost of transportation and smelting, then close hand sorting should be discontinued. It often occurs that the gangue remaining in hand-sorted ore, which might be treated at the mine at a profit, does not contain sufficient value to pay for shipment and treatment charges, which makes the situation still worse; but the fact that such gangue does contain sufficient value to pay these charges and possibly leave a profit does not justify its shipment when it may be hand-sorted and treated at the mine with greater profit.

At most mines where hand sorting is practiced the ore is broken down with hammers by a number of cheap men, who laboriously break and almost mechanically separate the high-grade sulphides from the gangue. Necessarily this process, unless carried to an extreme and expensive point, leaves a large amount of gangue in the selected ore sacked for shipment. It is cheaper, and will afford much more satisfactory results, to run the ore through a breaker and, if necessary, through a set of rolls.

Ore in which the high values occur in bunches or ribbons of sulphide material in a gangue of quartz, calcite, baryta or other material may usually be cheaply hand-sorted, as suggested above. When the ore is first brought from the mine it should be dumped onto a flat grizzly made of railroad iron or heavy bars set ½ inch apart. The ore should be washed by a stream of water from a hose, the fine material passing through the grizzly into a box or bin beneath. The large masses, now being clean, may be picked over by hand and often a quantity of clean sulphide mineral obtained, while a rough breaking with a hammer will often result in the recovery of still more. The remaining ore should then be shoveled off the grizzly into a car below and sent to the breaker, passing which a stream is again turned onto the ore, cleaning it for further hand sorting. The solid pieces of sulphide mineral may here be quickly picked out, the remainder going to the mill for reduction and mechanical concentration. A grizzly similar to the first may also be provided at the breaker for passing the fine material washed from the broken ore. The ore passing the grizzlies contains a high percentage of sulphide mineral and may be collected and shipped as first-class ore. In a plant of this description it would scarcely be advisable to add rolls unless trommels and jigs were also added. A plant of the latter description is more suited to ores wherein the sulphides form a heavy percentage, but values are more evenly disseminated, which condition renders hand-sorting impracticable.

Real vs. Bogus Mining Experts.

There is probably no class of men who are more abused than mining experts. That all who profess to be expert in mining affairs are really entitled to any such distinction is more than doubtful, but that the term "mining expert" includes men of undoubted ability and experience is equally true. Many definitions of what constitutes a mining expert have been given—some of them humorous and some abusive. However, the ideal mining expert must be a man of broad education and experience in mining matters, engineering and metallurgy, and there are many mining men whose experience in these matters entitles their opinion and judgment to more than ordinary consideration, and the term expert applied to such men is not a misnomer. When a mining engineer is sent to examine a property he must necessarily be conservative, for his own experience and that of others has taught him to accept little for fact that he cannot see, and he is often compelled to refuse to recommend a property—at the seller's price—in which he really sees merit, and possibly recommends at a lower price, and for this he is roundly abused by the miners, and sometimes the newspapers, of the district in which the property is situated.

In general, mining experts are accused of dressing ridiculously, going about the country with much circumstance and bluster, rushing hastily through a mine and passing judgment on its value. There are those who do such things but they are imposters, such as are found in every walk of life, and not entitled to be classed as expert at anything. There are often times when a mining engineer goes a long distance to examine a mine on the statement of the owner, or on a report written by some person signing E. M. after his name, who may be the blacksmith at the mine or a bartender in the village nearest the property. Having arrived at the mine, a glance is sometimes sufficient for the expert to decide that time spent in an examination would be wasted and ninety-nine times out of a hundred he will be right. It is rarely that a property is sold for a large sum without a thorough examination lasting from a few days to several months. There are cases of record wherein undeveloped mining claims have been sold for large sums on the advice of experts because of the value in adjoining mines.

Concentrates.

NO STONE containing iron sulphide is suitable for ornamental purposes.

ROTHSCHILD is reported having withdrawn from the American quicksilver market.

THE flux used at the Reno, Nev., reduction works is limestone from Wadsworth, Nev.

SO LONG as a prospect improves, however poor at first, the work of development should continue.

CERTAIN high grades of steel, used in making cutting tools, are not wholly suited to the making of rock drills.

IN '90 quicksilver sold in San Francisco, Cal., for $52 per flask. It is now worth $50—the highest price in nine years.

A DEMAND for nickel has been increased by its use in the steel industry, particularly in the armor of naval vessels.

THE Rio Tinto Copper Mining Co. of Spain has declared a dividend for the first half of '99 of 35s per share, or at the rate of 70% per annum.

MANY of the miners who during fall have been at Cape Nome have gone to Klondide for the winter, expecting to return to Nome in spring.

THE copper production of Arizona in '93 was 43,000,000 pounds; in '98 it was 110,000,000 pounds. The output of '99 is expected to reach 140,000,000 pounds.

THE fluctuation of 1 cent per pound in the price of copper makes a difference to the Anaconda mine, at Butte, Mont., of $85,000 per month at its present rate of output.

THE firing of several holes by means of the electric spark is thought to give an increased efficiency of 25%. It admits of deeper holes and consequently more rapid progress.

WHETHER Archæan rocks are metamorphosed sedimentary rocks or chemical precipitates has not been satisfactorily determined. Eminent authorities do not agree on this.

GLAUCOPHANE is a variety of hornblende of blue color. It is usually found in certain crystalline rocks. Glaucophane schist is abundant in the Coast Range of California.

A DISCOVERY of tin ores in Orange county, Cal., is announced. In that vicinity are found ores of lead, zinc, copper, quicksilver, silver and gold; but all, thus far, in small quantity.

AFTER copper, aluminum is the best conductor among the cheaper metals. An aluminum wire has the additional advantage of being lighter to handle and of being noncorrosive.

ALTA is a name given to a black slaty gouge-like material found in quicksilver mines. Originally it was applied to the hanging or upper wall, from the Spanish word alta, meaning above.

QUICKSILVER is found in the California gold belt at Mast's Cabinet mine, near Horseshoe Bend, 2¼ miles west of Coulterville, in Mariposa county, Cal.; also, near Placerville, Cal., in the Amador mine.

IT is estimated that about $10,000,000,000 in gold have been produced in the world since the discovery of America, of which sum more than one-half has been produced since '60 and one-fourth since '85.

A PARTNER drawing a salary in addition to profits is entitled to the same after the expiration of the period for which the partnership was formed, where the business continues without new agreement.

THE mines of the Frontino and Bolivia Co., S. A., are in limestone near a granite contact. The ore bodies are small, seldom exceeding 4 feet, but are usually rich in gold. It costs about $5 per ton to mine there.

A MIXTURE of magnesium carbonate and free silica heated in a solution of alkaline carbonate forms a hydrous magnesian carbonate. This reaction is supposed to account for the formation of some hydrous magnesian rocks.

GOLD-BEARING veins have been worked very little in Siberia, though they are known to exist. A large immigration is being made into that region—chiefly Russians—and a development of the quartz veins may be anticipated.

DURING the year ending July 30th, '98, there were patented to the railroad companies 504,671 aces of land in the United States. The whole area of the Northern Pacific land grant is 36,570,099 acres: of the Union Pacific, 12,129,842.

RUSSIA has decided to let in American miners, and the Siberian Department of Mines announces that a public auction of gold-bearing lands, situated on the northwest coast of the Sea of Okhotsk, will take place from Feb. 15th to 27th, 1900.

AN Eastern railway company last year ordered a large tonnage of new steel rails. The old rails which these replaced were sold this year at such an advance as to pay not only the cost of the new rails, but also for their laying, and leaving a profit as well.

A PURCHASE of goods while the buyer is insolvent, where made without intention of paying for same, is a fraud entitling the seller to recover the goods if found in the possession of the buyer or any person holding them for, or standing in the position of the buyer.

IN California most of the quicksilver deposits occur at or near the contact of sandstone and serpentine. In some instances dyke rocks are noticed in the vicinity of cinnabar deposits, notably at New Almaden, where a rhyolite dyke is an accompaniment of the vein.

IT has been suggested that the beach sands of Cape Nome region be concentrated and shipped to the United States for treatment in smelters. It would doubtless result in a larger saving than is now being made by the crude methods in vogue there at present.

THE smelter charges at Trail, B. C., are $20 per ton; the extra $12 per ton over cost in U. S. smelters represents the haulage and custom charges to American smelters. It likewise represents the profit to the Canadian Pacific Ry. Co. under the existing arrangements.

IN British Columbia mining locations are 1500 feet square, and no extralateral right can be taken under the law. The American law was in force there for a time but was repealed for the square location, numerous law suits having resulted from a short trial of the American law.

IN blasting rocks, certain general principles may be laid down, but each individual case must be determined by the judgment of the miner. Where power drills are used, it is often the practice to put in a certain number of holes in regular system, regardless of the results of the last series of shots.

THE Payne mine, in the Slocan district, B. C., is the largest and most profitable in that section. The lead carbonate produced there contains 80 to 100 ounces silver and 35% to 40% lead per ton, and the galena runs about 175 ounces silver and 70% lead. It has paid over $1,000,000 in dividends.

UP to 1840 charcoal was employed in making all the pig iron manufactured in the United States. The first blast furnace—a crude affair—was set up in '39. In '40 D. Thomas introduced the manufacture of pig iron by means of anthracite as fuel, from which the present great iron industry has developed.

THE Iron Mask and Center Star mining companies, of B. C., are credited with having expended $35,000 each on the mining litigation in which these properties have been involved and which is not yet settled, and the Butte City, Montana, suit recently submitted to the courts will cost, it is said, $300,000.

A $20 GOLD PIECE weighs 516 grains and contains 464.4 grains fine gold. There is $20 worth of pure gold in a $20-gold piece; the 51.6 grains of alloy therein is to give the coin hardness and durability. Whether in the shape of a coin or a melted nugget, the $20-gold piece, intact, as it came from the U. S. mint, is worth exactly $20 in gold.

NEXT year will not be a leap year, and will contain but 365 days; it was so with the year 1700 and will be so with 2100. By 2700 the extra eleven days omitted in 1582 will all have been accounted for, and the years will regularly run 365 days till some subsequent arrangement makes account of the extra time beyond that required for the earth to pass through its orbit.

WHEN sandstone is used in the construction of a building or a wall, it should not be set on edge but laid flat as it naturally occurs in its bed. When set upon edge, unless very firm, exfoliation is likely to occur, causing a cracking or crumbling of the rock. In cold countries sandstone absorbs water and upon freezing the rock will have a tendency to disintegrate.

TO MAKE iron take a bright polish like steel, pulverize and dissolve in one quart of hot water one ounce of blue vitriol, one ounce of borax, one ounce of prussiate of potash, one ounce of charcoal, one-half pint of salt, all of which is to be added to one gallon of linseed oil and thoroughly mixed. To apply, bring the iron or steel to the proper heat and cool in the solution.

UNDER the present U. S. tariff law the duties on metals are as follows: Antimony, metal or regulus, ¾c per lb.; lead, 1½c per lb. on lead in ores; 2½c per lb. on pigs, bars, etc.; 2½c on sheet, pipe and manufactured forms; nickel, 6c per lb.; quicksilver, 7c per lb.; spelter or zinc, 1½c per lb. in pigs and bars; 2c on sheets, etc.; copper, tin and platinum are free of duty.

THE International Mining Congress held its first session at Denver, Colo., in '97; its second session was held at Salt Lake City, Utah, in '98; it adjourned to meet at Milwaukee, Wis., in June, '99, but no meeting was held. Irving Mahon, secretary Executive Committee, says an official call will be issued this week for the session of 1900 at Milwaukee, to begin June 19 and last four days.

THE discovery of placer mines in British Columbia attracted attention to that country as a mining region in '58, and a rush of adventurers followed, but it was not until fifteen years ago that attention was given the great sulphide deposits. There were American engineers in the Kootenay country in '87, who at that time declared it was destined to become an important mining section.

AS YET no process which is chemically and mechanically a success, and at the same time not too expensive, has been devised to treat the complex ores found in many of the lead-silver-zinc mines. Of this class of ores there is a vast amount in the mines and on the dumps awaiting treatment. No less than twenty different new processes have been tried, but none of them have as yet been able to give entire satisfaction.

DURING the first ten months of '99 this paper lost 138 subscribers—and gained 1724 new ones. The figures well illustrate existing conditions in the mining industry; death and removal were the causes of the cessation of subscription of the 138; the advance of the industry and the realization of this paper's value to them the cause for the accession of the 1724 new ones in the last ten months. The greatest number of the total of new names comes from the States of Colorado and Montana and the Territory of Arizona.

GOLD DREDGING, as carried on in New Zealand and, later, in California, Oregon and Montana, is a dividend-paying proposition. The business has evolved from experiment to demonstrated profit. At Otago, N. Z., there are now about seventy dredgers at work, some paying dividends from 10% to 200%. The Electric Co., in South New Zealand, reports securing gold to the amount of $300,000 in less than four years. Dredging there costs about 3 cents per cubic yard; an entire plant costs from $15,000 to $35,000.

SILICIOUS SINTER is a deposit of silica formed about hot springs and geysers. Geyserite is a silicious snow-white formation of this character, and is found lining the pipes of geysers, and forms deposits about these vents. At Rotomahana, New Zealand, white terraces have been formed of silicious sinter, which are of great extent. The large deposits of travertine at the Formation Springs, in the Yellowstone National Park in Wyoming, are a deposit of calcium carbonate from springs, and differ from the silicious deposits above referred to.

IN artificial paving stones the newest process is to mix coal tar with sulphur and warm thoroughly; to the resulting semi-liquid mass, chlorate of lime (chlorkalk) is added. After cooling, the mass is broken into small pieces and mixed with blast furnace slag. This powder is then subjected to a pressure of 200 atmospheres and reduced to the form or forms wanted. The specific weight of these stones is 2.2; the resistance against crushing is 143 kilograms to the square centimeter. The resistance to wear and tear in use is said to be half as great as that of granite.

PROSPECTORS should take careful notice of every iron cropping, vein and deposit. Many veins are capped with iron, which is simply the oxidized product of the sulphide ores. Ordinarily, when the iron sulphide in its normal condition contains gold, the oxidized outcrop will prospect in free gold. There are exceptions to this, however, but an assay by fire will show the presence of gold. Silver leads are also often marked by a line of iron croppings, and some important and valuable deposits of copper ore have the iron gossan, though there may be no sign of copper appearing in the iron croppings, that metal having been leached out.

AS COMPARED with September, '98, the September, '99 output of copper by domestic mines showed an increase of about 4000 tons, while exports showed a loss of about 3700 tons:

	September—	
Annual Produced—	1899. *Tons.*	1898. *Tons.*
By United States reporting mines	19,515	17,064
By outside sources (estimated)	3,300	1,700
By foreign reporting mines	7,830	7,122
Exports	7,553	11,189

IT is difficult to give arbitrarily the cost of blasting in any particular rock, as the accompanying conditions always render each individual case different from all others. Granite is so variable in texture and composition in different regions, and even in different parts of the same region the structure, jointing planes and hardness are so variable that no exact figures can be given, and what applies to granite applies with equal force to all other rocks. In slaty rocks the direction of the shaft or tunnel, with reference to the strike and dip of the rocks, makes a material difference.

THE most recent discovery of palladium was in September at the Mount Torrens property, near Adelaide, Australia. Palladium was discovered nearly 100 years ago. It is nearly always associated with platinum and constitutes about 1% of the platinum ore of Russia and California. It is extraordinarily hard, is malleable, ductile, easily welded, and is used by mathematical instrument makers in construction requiring absolute accuracy. Palladium is used as a silver alloy by dentists, and is reported to be of service in case-hardening Krupp guns; it is roughly worth $50 per ounce.

TO SILVER PLATE any article, place eight silver 25-cent pieces in two ounces of nitric acid; when the silver has disappeared, add one pint of water and four ounces of common salt. The addition of the salt will precipitate powdery pure silver. Decant the water and repeat, washing till all the effects of the salt shall have disappeared. Then add two quarts of pure rain water and the silver solution is complete. Hang the articles to be plated in the solution, suspended at the end of a strip of lead, or they can be immersed and boil ten to twenty minutes, according to the thickness of the silver deposit desired. The articles to be plated should be clean and absolutely free from grease or dust.

STREAMS issuing from rocks containing pyrite or other sulphides which are in the process of decomposition often have a strongly astringent taste—the taste of alum. This is due to the free sulphuric acid in the water or to alum in solution which has been formed by a combination of the acid freed by the decomposing sulphides with the aluminous material present in the rocks, forming aluminous sulphate, which, dissolving as it forms by additions of fresh water, gives the water its peculiar taste. A search for a bed of alum under such conditions is not likely to result in its discovery, as the source of the acid is the sulphide mineral and not a deposit of alum. The yellowish brown deposit is due to the precipitation of iron taken up in solution in the water. It is deposited as oxide. It often acts as a cementing material to the gravel and debris lying in the valley or gulch below the spring—forming a local deposit of conglomerate.

THE Great Western quicksilver mine, in Lake county, Cal., has yielded considerably over 50,000 flasks of metal. The ore bodies consist of large lens-shaped masses at contact of a slightly altered sandstone and serpentine. The serpentine is accompanied by a belt of black opaline rock, known to the miners of northern California as quicksilver rock. This rock, being harder and less subject to decay than the surrounding rocks, stands up above the surface, veinlike, and constitutes the croppings of the vein. The ore bodies are in direct contact with the sandstone, but are surrounded on three sides by the serpentine. The ore shoots, along the strike of the lead, are separated by masses of barren rock. The ore is for most part cinnabar, but at one point a mass of rock was found charged with native quicksilver. Pyrite is abundant. Some of the cinnabar is embedded in quartz. No hot waters or gases now enter the mine. At the Abbott mine, in Lake county, Cal., there is a large influx of inflammable gas.

WHEN it is noon in New York it is 7 o'clock in the evening of the same day in the Transvaal, and 8:46 A. M., sun time, in San Francisco. News from Glencoe, Ladysmith and other points in Natal, South Africa, reaches San Francisco over the Durban and west coast line or via Cape Town and and the east coast. From Durban the cable runs 345 miles to Lorenzo Marquez (Delagoa Bay), thence into the Indian ocean and emerging at Mozambique, 974 miles away, thence by cable to Zanzibar, 692 miles, and finally to Aden, 1920 miles farther. From Aden the news goes under the whole length of the Red sea to Suez, 1403 miles, thence on land wires along the Suez canal to Port Said, 92 miles; then by cable to Alexandria, 154 miles; thence to Malta, 928 miles; to Gibraltar, 1126 miles; to Lisbon, 398; to Lands End, England, 899; then by land to London and from London to Dublin, thence to Waterville, Ireland. From there it goes under the Atlantic ocean to Nova Scotia, 2348 miles; 840 miles of cable remain and the news is at New York. From there to San Francisco is 3200 miles more. Over the west coast route the start is made at Cape Town, thence by cable to Mossamedes, 1383 miles; to Benguela, 234; to Loanda, 296; to Accra, 975 miles; to Sierra Leone, 1020; to Bathhurst, 463; thence to Santiago, a British possession near the Cape Verde Islands, 470; to St. Vincent, 204 miles; St. Vincent to Maderia, 1169; to Lisbon, 632 miles; thence to London following the same route as news from the east coast.

Notes on Mine Surface Sampling.*

Written by S. H. PEARCE.

The primary object of sampling is to obtain, in as small a bulk as may be convenient, a portion which shall represent the whole, in whatever particular that may be desired. In sampling any material where the constituents are unevenly distributed, this want of uniformity is the greatest drawback to obtaining a representative sample, no matter for what purpose it is required; and the difficulties may be further enhanced by circumstances.

Use is to be made of the law of averages in order to overcome most of our difficulties, which should be carried to such a point as is found to give sufficiently correct results.

The subject matter is anything but uniform in regard to the one constituent we wish to determine, for in the case of rock to mill we have a mixture of all values, from waste rock, containing practically nothing, to reef matter, containing as much as fifty ounces to the ton.

To further complicate the matter, we have variation in size, from dust to pieces as big as a man's head in some cases, and probably no two pieces having the same value.

As a third difficulty, we have the enormous quantities of material to sample daily, which amounts to as much as 1000 tons in the case of a 200-stamp mill.

These are the main difficulties in sampling rock to mill; there are some others, but they are comparatively unimportant. If we consider them, we find that the only way to overcome the first two is to take a large enough proportion, which, unfortunately, the third condition renders impossible.

There are three ways more or less generally adopted in sampling rock to mill:

1. From the trucks to mill.
2. From the cam floor chutes.
3. From the feeders.

From Trucks to Mill.—This sample is generally obtained by taking a shovelful from each truck, and, if it were fairly and regularly performed, would give very fair results; but the difficulty comes in with the large quantity necessarily taken. A shovelful weighs about seven pounds, and even with a 100-stamp mill, where one-ton skips were used, the daily sample would amount to 1½ tons, which is a considerable amount to crush and quarter down for assay. Even were this of no consideration, there would be a tendency for the larger lumps to fall off the shovel and an unfair proportion of fines taken, and as these are usually the richer part of the material being considered, the sample would be generally too high. It is not unusual to put a kaffir on to taking a handful or a lump as the fancy takes him. There can be no regularity or much dependence placed upon a sample so obtained.

From Cam Floor Chutes.—This sample is obtained by taking a shovelful from each chute, at regular intervals, usually hourly.

It seems to give fair results on some mines, but it has the same drawback as the last in regard to the quantity taken; in this case, however, the rock in the bins in traveling down the chutes has a tendency towards separation of the fines towards the bottom and the coarser to the surface, and the probability is that the sample will have too much coarse rock. It is possible that this in a great measure will counterbalance the tendency for the lumps to fall off the shovel.

From Feeders.—This sample is also taken at intervals of time like the last. There are two ways in which it may be taken, *i. e.*, by small shovelfuls from the disc of the feeder, or by holding a tray made to fit the edge of the disc under it, to catch that which falls from it.

In speaking generally of all these rock samples, it would appear that they will give too high a result, and I may say further that the smaller the sample taken, the more erratic will the results come out daily.

It has also been my experience that the larger the mill the more steady will be the daily assays; in this case I do not think that this is due so much to the quantity taken, as that it is taken from more places, and has a better chance of being mixed.

Quartering Down.—Every mine should be equipped with a proper sample room, fitted with suitable crushing machinery, which, if not actually needed for rock to mill samples, is at least required for mine samples.

The old style of kaffir, and pestle and mortar on the veld, useful enough in the past, and in the present as a stand by, cannot to-day be considered as sufficient to meet the requirements of a modernly equipped mine.

A properly equipped sample room, an example of which may be seen on the Nourse Deep, should be large enough for all purposes; being, say, 16 feet square, fairly draught and dust-tight, and have a floor of cement, or iron plates, on which a large sample may be quartered down; and have at least two crushing machines; one for reducing, say, to ½ inch cube, and the other for fine grinding. There should be a quartering table, and counters and shelving, as well as the panning tank, if such is required, and all articles such as sieves, brushes and other little things supplied freely.

In regard to quartering down, I lay before you a small table, which, if not exactly accurate, may be taken as a fairly safe guide to the limit to which it is advisable to go in reducing the bulk of your sample:

2-inch cube to	1200 lbs.
1-inch cube to	300 lbs.
½-inch cube to	80 lbs.
¼-inch cube to	20 lbs.
⅛-inch cube to	5 lbs.
1/16-inch cube to	2 lbs.

These figures are based upon experience and convenience.

The old practice of quartering is, I think, as good as any other. It may be tedious, but it is at least free from the objection attached to most of the machines used for that purpose.

Spread as thinly as you can, and be careful to eliminate the whole quarter each time. Use a brush for that purpose, if necessary, so as not to leave any fine matter behind, which may perhaps contain free gold. Mixing between each operation cannot be performed too thoroughly. In cases where the ore has been very finely ground, it is more difficult to mix than coarser material, and in such a case I think it is not an unnecessary precaution to mix by passing through a sieve.

Screen Sample.—This is obtained by taking a certain quantity of the pulp as it passes through the battery screens, at regular intervals of time. In this case at least one of the disturbing factors is removed, and the ore is now reduced to a finer state of division, and is better mixed; under these conditions a smaller sample can be taken with more reliable results. The difficulties will be found to exist mainly in the limited space there is to use a receptacle of any size for the sample, so that you have to guard against overflowing and consequent concentration.

In regard to the splash, I should suggest the adoption of a splash board to throw the pulp downwards on to the iron lip, and so help to carry away the heavy matter continuously. I would advise the use of as large a vessel as may be convenient, and not be afraid to take a good big sample. I also think it a good thing to try and arrange the time of sampling, so that it comes just before the time for adding the mercury to the boxes, so as to avoid as much as possible the inclusion of amalgam.

I consider this sample as being the nearest daily check upon the value of rock milled. It has the disadvantage of being minus the gold caught in the boxes, and this has to be remedied by adding that amount, divided by tonnage, to the assay at the end of the month; this will include die sands, screen tanks and lip sands.

(To be Continued.)

*Condensed from Journal Chemical and Metallurgical Society of South Africa.

Put the Blame Where It Belongs.

TO THE EDITOR:—I notice in a recent number of the MINING AND SCIENTIFIC PRESS that Mr. N. S. Keith, in his valuable articles on "Amalgamated Copper Plates," winds up with the statement that "it seems almost superfluous to say that ignorance and laziness are the causes of these conditions" (of the plates), which statement seems to me to imply that we of the amalgamating fraternity are the parties to be indicted. Let us see if sometimes the blame does not lay higher!

At the X Y Z mine the new superintendent found the plates in that pasty condition so often described as being just the thing. Something, however, in his estimation, had to be done, as the rock was getting lower grade, and the number of ounces of amalgam obtained was consequently less each day. So the boys were hurrahed on to the plates to keep up the average, and most nobly did those devoted plates respond.

Day after day an iron-muscled mine foreman on one side, with scraper and rubber, was bound to get an extra cent over the day before and win a grin from the powers that be, a mad amalgamator on the other side having to follow suit in the murder of his pets. Finally, even copper couldn't stand it and the yellow flag of distress was hung out by one plate after another, to be shortly after followed by the greenish and brown color of dissolution.

The N. O. P. mill started out with a brand new set of heavy plates well silvered. The slaughter was ordered from the word go, hot water being piled on top of the rest of the agony. Those plates were very soon ready for the attention of the plating works. WALLACE J. WILLIAMS, Millman.

Nevada City, Cal., Oct. 18th, '99.

Typical Prospecting Scenes.

The accompanying illustrations are typical of new mining regions in the West. The first one shows the hardy miner and the man who is "putting up" for him at the windlass. When the bucket comes up, the miner goes below and digs another bucketful, while the monied man "assays" the ore by taking a sample, crushing it in a mortar and panning it, as shown in the second illustration. Close check on the value of the ore is thus kept. The vein in this instance is about 2 feet in width, and in sinking the shaft some 50 feet the value of a few tons of ore taken out more than paid all expenses; and a lot of good second-grade ore shows on the dump.

The prospect hole is on the Hamburg, a new discovery near Silver Star, Mont., and is owned by Dr. A. W. Noble of Butte, Mont., and Mel Cabbage of Silver Star.

It is evident that, while having a good thing, no money has been wasted in preliminary investigation. The shaft timbers are of unpeeled logs, and the windlass standards and braces have been picked up somewhere; yet this shaft, or another near it, is more likely to have an expensive hoisting plant over it than many other prospects which start out under what may seem to be more favorable auspices.

WORKING ON A GRUB STAKE

A HOME-MADE MILL TEST.

Copper in South Africa.

South Africa may become a producer of copper as well as gold. The report of the directors of the Northern Territories Exploring Company, Ltd., states that the expedition to the north of the Zambesi for the purpose of marking out the concession of 500 square miles returned to Buluwayo, having located numerous copper mines. From the report of the leader of the expedition it appears that there are on the properties large old workings, similar to those found in Rhodesia, and the dumps are covered with carbonate of copper ore. The outcrops are large, and show some rich lodes of copper. Some of the mines are still being worked by the natives, who, owing to their primitive means and indolent nature, can only deal with very rich ore, working the metal up for ornaments, and also into bars for trading purposes.

Notes on the Ymir Mine and Its Mill Practice.

By S. S. FOWLER, Nelson, B. C.

Lying north of the International Boundary, west of Kootenay lake, east of Columbia river and south of Nelson, and the outlet of Kootenay lake, is a roughly quadrangular mountainous country covering about 1450 square miles.

Occupying the central portion of this quadrangle is the drainage area of the Salmon river.

This Salmon river country, covering about 900 square miles, was practically inaccessible until the construction of the Nelson & Fort Sheppard railway in 1893, and it was not until the summer of 1896 that any considerable mining activity was manifest. Aside from the placer mining operations of thirty-five years ago, which were carried on near the mouth of the Salmon and along the Pend D'Oreille, there is no evidence of mineral location until 1885, two years before the discovery of the Silver King, near Nelson, by the Hall brothers.

Physically, the Salmon country is not complicated in structure. It is mountainous, but few of the mountains reach an altitude of more than 8000 feet, and the summits are generally rounded. The creek valleys are deep, however, and glaciation appears to have been an important factor in determining the present topography. The glaciers, have, I believe, all disappeared.

The rocks which underlie the region being described, are of igneous origin. In a general way it it may be said that east of the Salmon the granites are in evidence, while to the west augite porphyrites, schists derived from them, some small gabbro bosses and large areas of tuffs and agglomerate occupy the field. But throughout these rocks may be seen considerable inclusions of sedimentary rocks, principally slates, except along and near the range which forms the watershed between the Salmon river and Kootenay lake, where there are thick beds of quartzites and some crystalline limestone, extending southwesterly into American territory.

The small slate areas of Salmon river are probably of Cambrian or pre-Cambrian age. The various basic igneous rocks may be of different ages. Some of the granites appear to be comparatively recent, but the youngest rocks of the vicinity occur in dykes of blackish to dark grey color, varying much in texture and composition, and piercing the rocks above named and, I believe, most of the veins of the district. Generally these dykes may be described as mica diabase, the biotite probably being a first product of alteration, while frequently the whole mass has become completely kaolinized.

The Ymir mine is on the west side of the valley of a north fork of Wild Horse creek. This valley lies in a slate area several miles in length and 4000 to 5000 feet wide. The slates are limited on the east by granite and on the west by porphyrite. They strike about N. 35 E. and stand on edge, the line of contact with the porphyrites being approximately parallel to the strike. Extending from a point near the contact in a direction about N. 65 E. is a fracture in the slates which is traceable several thousand feet, but within the distance along which this one fracture can be identified there are no ore bodies known other than that which has become the Ymir mine.

Since November, 1896, 5000 feet of development has been done, resulting in showing an ore body 500 feet in length, with its end limits practically parallel and vertical. A depth of nearly 500 feet has been attained, but very little water has been encountered —in fact, barely sufficient to justify running a pump for sinking.

In plan this ore body shows a lenticular shape, with a maximum width of ore of about 30 feet. No disturbances of importance have shown themselves, but there are many slips and several partially open narrow fissures, while two principal dykes with a number of branches cross the deposit generally nearly at right angles to the latter. From a structural standpoint these dykes form one of the most interesting features of the mine. Beside the numerous horses of slate the vein filling is quartz, impregnated with pyrite, galena and blende, no copper mineral having ever been found.

The ore appears to have been deposited at two different periods or derived from different sources, for the eastern 300 feet shows a white quartz, and the sulphides contained are coarser in structure and brighter in color than in the western 200 feet of the shoot, where the quartz is not only frequently of dark blue color and often nearly opaque, but the gold tenure is considerably higher. Near the region where these two varieties of quartz join they are curiously intermixed, but may be easily distinguished. Throughout the mine the walls are usually free, but in places along the hanging of the blue quartz there is not only no clay parting, but the quartz seems to have replaced the slate, retaining the structural features of the latter and becoming difficult to distinguish underground from the country rock.

Subsequently to the deposition of the ore of both these bodies the dykes were intruded and the fractures which rendered their presence possible seem to have been followed by movements more or less in the direction of the plane of the vein, and in parts along the walls, with the result that other fissures were formed, some extending for some distance into the foot wall, diagonally to the strike of the vein, and others along the hanging wall. These last fissures are filled with a nearly barren white quartz, carrying at times sharply angular fragments of slate.

The later movements have also created fractures in the ore body, along one of which at least, where there is a local concentration of galena, oxidizing action has been going on, with the result of producing a band of carbonate, affording fine specimens of cerussite and a local but marked increase in the gold values, the gold being largely free but invisible except after careful panning.

In the No. 2 level a 4-foot dyke comes squarely up to the foot wall, where it turns a right angle to the left along the wall, and so continues, gradually curving to the right for 20 feet, where it crossed the drift squarely. Going through the dyke we found slate, and crosscutting on the outer side of the dyke we found it suddenly turning again and butting against a fault fissure, nearly filled with 2 feet of calcite. Our failure to closely examine what we presumed to be the foot wall rock led us astray, and to an expense which was useless at the time except to reveal an interesting structure.

The fact that much of the ore body is too wide for stulls, and that good mining timbers are scarce, together with the presence of what will probably prove itself to be a not too strong hanging wall, will undoubtedly necessitate a system of combined crib work, filled with waste and of square setting.

The mine produces two general classes of ore: first, mill stuff; second, crude ore. The former is sent directly to mill by a Hallidie ropeway, about 2400 feet in length from the mouth of No. 3 tunnel, the lowest which has exit to the surface. The second general class consists of two sub-classes, crude galena and oxidized ore or carbonate. Both of these are small in amount compared to the milling ore, and they are shipped directly to the Hall Mines Smelter at Nelson, the crude ore in bulk and the carbonate in sacks. Milling material at the lower tramway terminal passes through a No. 3 Gates crusher, which reduces the coarsest to pass a 2-inch ring. Below the crusher is a 200 ton bin from which the feed passes by tram car, after being weighed, into the battery bins proper.

The mill proper embraces a 40-stamp 850-pound battery, eight silvered copper plates 56 inches by 12 feet, four sets of four-cone classifiers, and twelve 6-foot Frue vanners. This plant is driven by water with a 6-foot Pelton wheel under 415 feet head, the crusher being separately driven by a 24-inch motor under 320 feet head. The stamps make from 96 to 102 6½ inch drops per minute, and with an average issue (height of discharge) of 7 inches crush a little over 100 tons per diem through No. 9 diagonal slot screens.

We have found a tendency toward banking of the pulp at each end of the mortar, to avoid which we give the first and fifth stamps about 1½ inch greater drop.

We employ one inside plate, and on it accumulates about 40% of our gold. The outside plates slope 2 inches in 1 foot, and on the upper 24 inches of their length we gather about 80% of the recovered free gold which passes the screens. The lower part of the plate (10 feet) we find to be very valuable, and it passes an extremely small amount only of free gold. An interesting feature of the operation of the lower part of the plate is that the amalgam on that portion is very much higher in silver than that gathered elsewhere, and proportionately lower in gold.

Zinc blende and pyrite cause us no trouble in keeping the plates clean, but the extremely small size of the galena particles, together with their gravity, causes them to catch in the minute depressions of the amalgam and gradually to cover the latter. For this reason our plates are dressed every six hours, and thus we are able to keep them in excellent condition. This result we consider good work in view of the fact that our concentrates amount to 6$\frac{3}{10}$% of the mill feed, and contains our 14% lead and 10% zinc.

The bullion produced averages about $\frac{580}{1000}$ gold, $\frac{400}{1000}$ silver and $\frac{20}{1000}$ base, thus showing practically no amalgamation of lead, but the presence of a very considerable amount of free silver.

Without disclosing the gold tenure of our tailings, I may say that they are satisfactory, and, in fact, are remarkably low when we consider the apparent baseness of the ore. Of the total gold and silver recovered we find in the bullion 82% of the gold, 27% of the silver, and in concentrates 18% of the gold and 73% of the silver.

The ore, thus far, has shown itself free from acids and from arsenic, antimony and tellurium, a fact which is partially reflected in the very low consumption of quicksilver, viz., about $\frac{9}{10}$ of one ounce avoirdupois per ton crushed.

*Condensed from paper read before Canadian Mining Institute.

Soda Nitrate in Chile.

Consul Merriam, of Iquique, writes that the cost of production of nitrate varies greatly in the different establishments, depending upon the abundance and quality of the "caliche," or crude nitrate, distance from port, price of coal, etc. Moreover, the manufacturers are not disposed to declare the cost of production, considering this to be one of the secrets of the trade. Railroad transportation rates to the coast are 6d (12 cents) per Spanish quintal of 100 pounds for forty miles or more, with a proportionate reduction for distances under forty miles. On and after January 1, 1900, the rate will be 4½d (9 cents). The average rate of ocean freights for nitrate from January to June of the present year has been 27s 2d ($6.61) to Europe and the United States. Below are given figures showing the exportation of nitrate of soda from the ports of Iquique, Pisagua, Junin, Calesa, Buena, Antofagasta, Trocopilla and Taltal:

	Tons.
1896	1,091,681
1897	1,063,349
1898	1,272,121

Cyaniding Prior to Amalgamation.

TO THE EDITOR:—Referring to the communication in your issue of Sept. 23d, '99, entitled "Cyanide Prior to Amalgamation," and suggesting reversing the usual practice of amalgamating first and cyaniding afterwards, I would say that at the Clark mill, at Rochester, Montana, a custom mill, the ore is crushed coarse and cyanided. The leached material then passes through a ball pulverizer, where it is crushed to from 80 to 100-mesh, from whence it passes over amalgamating plates and a Wilfley table. The amount of gold obtained by amalgamation has been so slight that amalgamation is now dispensed with in treating most ores and the pulp passes direct to the Wilfley table. Some of the ores in this district contain a small amount of galena and this is so brittle that even with coarse crushing the metallic particles are fine. By crushing all of the ore very fine a close saving of the galena, which always carries more or less gold, is effected and the concentrate is a valuable product. With most Montana ores, cyaniding prior to amalgamation would not tend to increase the amount that could be saved on the plates, but the reverse would follow, and with a considerable proportion of the ores in the lime formation, particularly, fine crushing is essential to a good saving by either amalgamation or cyanidation, and with fine crushing a more perfect extraction can be secured by the use of cyanide than by amalgamation. With an ore containing quite coarse gold there might be an advantage in cyaniding first, but it does not so seem to me. The period of leaching would necessarily be lengthened indefinitely, because of the uncertainty existing—one not knowing whether the tailings from his vat would run lower by longer leaching or not. No! The experience of the many is the criterion to go by. Take out the coarse gold first; then leach the tailings, and when as perfect extraction has been secured as can be, the assay of the residue shows it with a freedom from the uncertainty that must follow the other proposed method. MATT. W. ALDERSON.

Sheridan, Montana, Oct. 23d, '99.

The Use of Charcoal in the Cyanide Process.

TO THE EDITOR:—I have read with much interest your editorial in the last issue of the MINING AND SCIENTIFIC PRESS regarding "The Use of Charcoal in the Cyanide Process," and the connection of the late Dr. W. D. Johnston with the same.

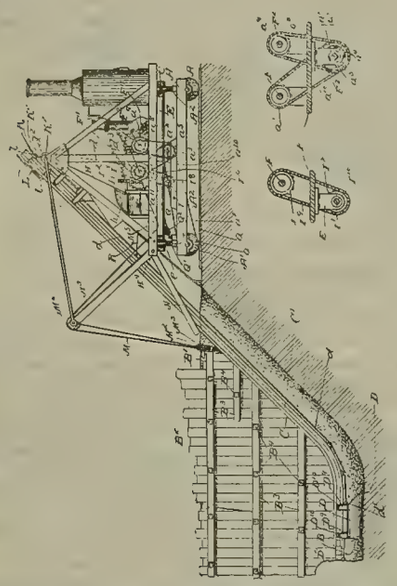
Several years before Dr. Johnston was appointed chemist of the State Mining Bureau I brought to his attention a pamphlet describing the use of charcoal in the Mears & Davis chlorination process for the precipitation of gold from the ter-chloride solution, and the mode of passing the solution through the filter used by Mears & Davis. As far as I know, this was the first use of charcoal for this purpose.

Dr. Johnston became much interested in the subject, and subsequently when it was announced that he had obtained a patent for the use of charcoal in the cyanide process I readily understood how he was led to its adoption. Dr. Johnston was a person of quick and clear perception and an expert in experimentation, and to his mind the suggestion, the transition from its use in the chloride solution to that of the cyanide, was an easy step and its value soon practically determined by him.

The problem I submitted to him was whether the action was chemical or mechanical, and I don't know that it has yet been solved.

Of the objections raised to the use of charcoal in the cyanide process only one has any weight, and that is the one mentioned in your editorial, viz: that the finely divided particles of charcoal pass through the filter and affect the solution injuriously for future use. This can be readily prevented.

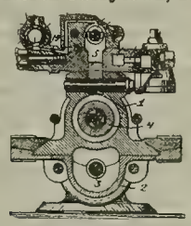
Sonora, Oct. 23d, '99. LOUIS BLANDING.



It would seem from the fact, as stated in the editorial on the subject in the issue of Oct. 21st, that as the gold was found coating a solid piece of charcoal floating in the cyanide solution during Dr. Johnston's period of experimentation that the precipitation was largely, if not wholly, chemical.—ED

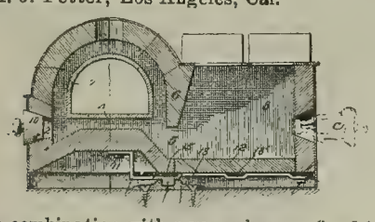
Latest Mining and Metallurgical Patents.

Patents Issued Oct. 24, 1899.



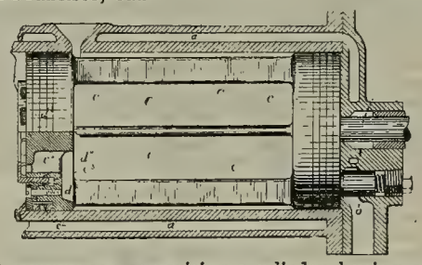
Specially Reported for the MINING AND SCIENTIFIC PRESS.

EXCAVATOR.—No. 635,047; G. W. King, Marion, Ohio.



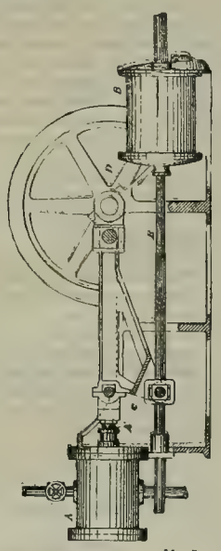
An excavator having a longitudinally movable platform *A*, the framework or structure *E* mounted upon and movable transversely of the platform, a shovel-guiding track, the excavating shovel held in connection with and movable endwise of the track, the shovel and track having the arrangement required to render the shovel capable of excavating in the direction of the framework, apparatus for actuating the framework and the track and shovel actuating apparatus being supported from the framework.

OILING DEVICE FOR ROCK DRILLS.—No. 635,286; R. L. Ambrose, North Tarrytown, N. Y.



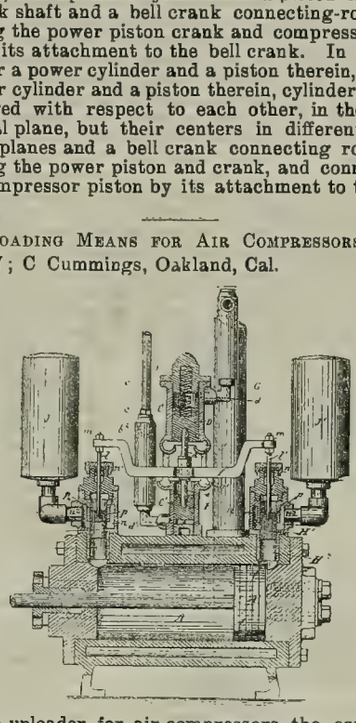
The combination with a rock drill comprising a cylinder, a piston, a valve chamber and a valve arranged to reciprocate therein and control the admission and exhaust of the motive fluid to and from the cylinder, of a casing pivoted or swivelly mounted upon the side of rock drill, casing being provided with a filling hole at the top, a circular channel arranged between casing and rock drill, a hollow plug rotatably mounted in casing, plug provided with an orifice adapted to register with filling hole when plug is turned in one direction, a channel connecting with circular orifice, and with the interior of plug, when plug is turned in the opposite direction, and a channel leading from the circular channel to the interior of the valve chamber.

ASSAYING FUREACE.—No. 635,586; O. W. Martin and A. J. Petter, Los Angeles, Cal.



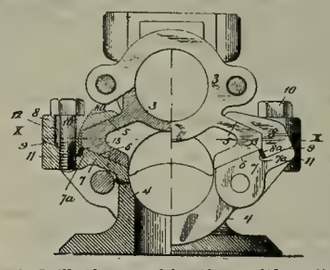
The combination with a vapor burner fixed in position, of a pivoted furnace adapted to rotate horizontally, furnace including a smelting or crucible chamber having a burner hole, an adjacent cupeling or muffle chamber having a separate burner hole, and an open passage between the two chambers, as shown and described, whereby both chambers may be heated by one and the same medium, or one of them independently, as required. The combined furnace comprising two firing chambers arranged adjacently in the same structure or body, and connected by an open passage, and having independent burner holes at either end, the body of the furnace being pivoted to adapt it for rotation. The body of the furnace having a removable raised bottom, inserted from beneath, of latches or latch bars crossed upon bottom and pivoted together centrally and a series of catches fixed on the rim of the furnace body, and adapted to lock with bars when the latter are swung horizontally into proper position.

AIR COMPRESSOR.—No. 635,516; J. P. Simmons, San Francisco, Cal.



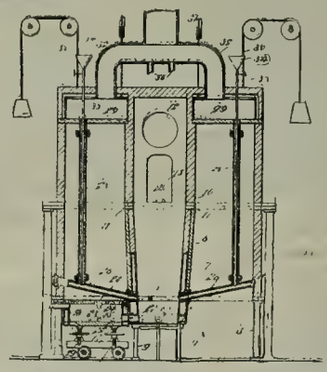
A compressor comprising a cylinder having suitable outlets, a cage piston therein provided with a valve-controlled port in each end thereof communicating with the interior of the cylinder on opposite sides, and an annular recess or pocket exterior to and separate from port, in which the stem of the valve is guided. The combination with the piston of a compressor having an annular passage, of a ring valve controlling the passage having an annular stem projecting within the body of the piston and provided with a radial projection, and a ring detachably secured to the piston adapted to engage with the radial projection whereby the movement of the valve is limited.

AIR COMPRESSOR.—No. 635,517; J. P. Simmons, San Francisco, Cal.



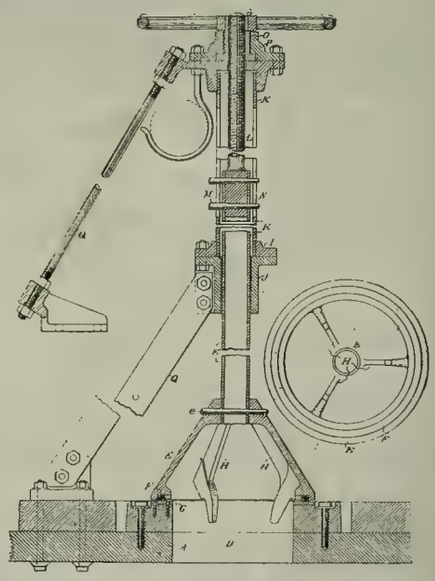
In a compressor a power cylinder and a piston therein, a compressor cylinder and a piston therein, a crank shaft and a bell crank connecting-rod connecting the power piston crank and compressor piston by its attachment to the bell crank. In a compressor a power cylinder and a piston therein, a compressor cylinder and a piston therein, cylinders being arranged with respect to each other, in the same vertical plane, but their centers in different horizontal planes and a bell crank connecting rod connecting the power piston and crank, and connecting the compressor piston by its attachment to the bell crank.

UNLOADING MEANS FOR AIR COMPRESSORS.—No. 635,667; C Cummings, Oakland, Cal.



In an unloader for air compressors the combination with the compressor cylinder, of the valve chambers connecting with the interior of the cylinder near each end thereof, the air receivers of approximately the same volume as the cylinder, connection between the valve chambers and the receivers, a piston valve working in each chamber so as to control the communication between the cylinder and air receivers, the piston cylinders, connected pistons working therein, a yoke carried thereby, connection between the yoke and piston valves, the high and low pressure supply pipes and the pistons whereby the pistons are raised and lowered by the change of pressure in the supply pipes.

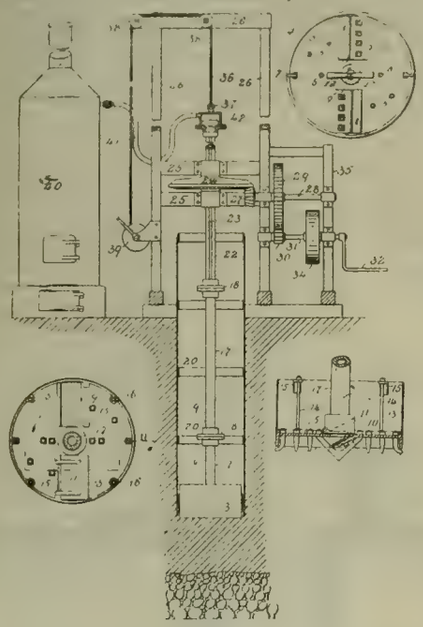
ROCK DRILL.—No. 635,301; H. V. Conrad and R. L. Ambrose, North Tarrytown, N. Y.



In a rock drill the combination with cylinder and guides on cylinder composed of longitudinal ribs, each of ribs having faces *5 6* converging as shown, of a shell having stationary slideways *7* upon which the lower face *6* of guides engage, adjustable slideways *8* with which the upper faces *5* of guides engage, angular faces *9* through which the adjustable slideways engage with the shell, bolts fitted to shell, slotted holes in adjustable slideways through which bolts are adapted to pass and removable spacing pieces *13*.

SMELTING FURNACE.—No. 635,652; J. H. Canavan, Kirkland, Ariz.

A smelting furnace, comprising an outer shell or casing, a cupola arranged therein and having a water jacket, a chimney at the upper end of the cupola, the outer shell or jacket and the walls of the cupola and chimney forming walls of hot-air chambers open at the bottom, forehearths movable underneath the hot-air chambers, water jackets surrounning the forehearths, trucks on which the forehearths are mounted, means for vertically moving the hearths, tuyeres extended into the cupola at opposite sides, air-blast pipes in the hot-air chambers and communicating with the tuyeres, air boxes with which the upper ends of pipes communicate, and a pipe for discharging air into said air boxes.



DISCHARGE GATE FOR TANKS.—No. 635,442; C. W. Merrill, Alameda, Cal.

The combination with a vat or like inclosure having a bottom discharge opening and an annular seat

surrounding opening, of a hollow conical gate with a thickened channeled rim at the lower edge and a packing ring fitted therein and adapted to close upon the seat, interior guides by which the gate is centered when closing, a tubular stem fixed in the top of the gate, extending upwardly therefrom having a screw shank fitted in its upper end, an exterior tube within which the gate stem and screw are movable, a nut having a hand wheel fixed thereto and turnable in a retaining head whereby the screw and connected parts are caused to rise or fall, keys by which the lower end of the screw is secured to the gate stem, slots made in the sides of the outer tube through which the ends of the keys project to serve as guides and prevent the screw and gate from rotating when the nut is turned.

APPARATUS FOR MINING IN FROZEN EARTH.—No. 635,522; J. E. Stuart, Winchester, Cal.

An apparatus for mining in frozen earth comprising an auger consisting of an annular flange having an interior crossplate formed with a radial opening and with a radial depending flange projecting beneath the opening and a radial cutting plate secured to the depending flange, a cylinder, angular lugs and bolts whereby the cylinder is secured to the crossplate, a hollow shaft secured to the crossplate whereby the auger is supported and a centrally located V-shaped bracket secured pendantly to the crossplate beneath the hollow shaft and crosswise of the radial opening.

PROCESS OF TREATING GOLD OR SILVER ORES.—No. 635,199; J. Smith, Salt Lake City, Utah.

A process for treating gold and silver ores, tailings, slimes and like materials containing precious metals, which consists in mixing the material to be treated with caustic lime, saturating or covering the mixture entirely with water and keeping it thus until all the acid present has combined with the lime, drying the material, exposing it to the action of atmospheric air, and treating it with a cyanide.

Notes on the Geology and Mineral Deposits of Vancouver Island.

Written for the MINING AND SCIENTIFIC PRESS by H. W. FAIRBANKS.

Vancouver is the largest of the islands lying off the western coast of North America. Its longer axis, lying southeast and northwest, has a length of nearly 300 miles and the shorter axis of about sixty miles. At the southern end is the city of Victoria. On the eastern side are Nanaimo and Wellington, noted for their valuable coal deposits. Other settlements are scattered along the deeply indented coast, but the greater portion of the island remains in its primitive condition.

With the exception of some low areas along the coast, the island is mountainous. The crests along the center rise from 4000 to 8000 feet. Perpetual snow mantles the higher peaks, and in places well-defined glaciers still remain.

The whole island is covered with coniferous trees. Cedar, fir, spruce, balsam and hemlock are the principal trees, and owing to the rapid growth and slow decay there is formed an almost impenetrable mass of fallen and living growth.

This dense vegetation makes prospecting exceedingly difficult, and except on the higher and more rugged mountains it is mostly confined to the coasts and stream beds. Much of the island has never been explored and numerous rivers and large lakes exist there which have never been placed upon a map.

The geology of the island has not been studied in detail, but the work of Dawson and the Canadian Geological Survey has shown that there are two distinct formations represented here. The older he has called the Vancouver series. It is mostly of Triassic age. It forms the greater part of the island and consists of limestone, slate and flinty quartite, with enormous areas of interbedded volcanic flows. This is the mineral-bearing formation.

To the east of the island, forming the adjoining mainland and the numerous intervening islands, lies a great body of granite, intrusive in the Vancouver series. But little of this granite mass is found upon Vancouver island.

The other important formation upon the island is the Cretaceous. It carries the coal, and the latter has been up to the present the chief production of the island. This formation is at present limited to a strip along the eastern side from the region of Nanaimo north, and to scattered areas at the north end of the island. The fields which have thus far been found to be productive are the Nanaimo, Wellington and Comox. Coal is found, however, at almost all points where the Cretaceous occurs, and prospecting at Quatsino sound and upon the eastern shore north of Comox has been carried on.

The coal from this Cretaceous formation is the oldest, geologically, and probably the best which will ever be found upon the Pacific coast. At Nanaimo and Wellington the coal has in places been found to be 14 feet thick. In the vicinity of the former place the coal formation extends out under the ocean and the adjoining islands. Upon some of these islands shafts have been put down.

It is only in recent years that ores of the metals have been found upon the island in paying quantities, and even now there are no well-developed properties. Consequently the full character and extent of the ore bodies are not yet known. Since the Alaska excitement prospectors have gradually spread over the island and many apparently valuable discoveries have been made.

So far as I am aware the ore bodies found here are all base. They consist chiefly of the various ores of copper, iron and zinc, nearly all carrying gold and silver in varying quantities. Chalcopyrite is the common copper ore. Bornite is also found in places. Of the iron ores, magnetite and pyrrhotite are known. Pyrrhotite, especially, is found in large quantities.

Veins and bunches of quartz containing iron pyrites occur in many places, but they do not generally seem to carry very much gold. The ore deposits are more often found at or near the contact of the limestone with the various dykes of igneous rocks which are so common.

Prospecting has shown that here, as in other mineral regions, many of the deposits are of small size and too bunchy to pay for working, but, nevertheless, about Alberni and Clayoquot sound, and the southeast arm of Quatsino sound, copper deposits have been found which will undoubtedly prove of value. Alberni and Clayoquot prospecting has been especially active the past season.

So far as I have observed the ore deposits do not occupy defined fissures, but occur along more or less regular zones of impregnation or replacement. Some prospectors with whom I have talked seem to think that the deposits do not go down, but there is no reason why they should not. In places upon the mountain sides the ore bodies are exposed vertically for nearly 1000 feet. Although the deposits are bunchy, there does not seem to be any reason why they cannot be mined where they are of any size. The exceedingly moist climate prevents deep oxidation, and no mistake as to the real character of the ores can be made.

The deep inlets make access to nearly all parts of the island comparatively easy, and this, together with the abundance of timber and the magnificent water power in the streams, the presence of coal and limestone, make itpossible to carry on profitably the smelting of low-grade ores.

A Valuable Publication.

TO THE EDITOR:—I beg to call your attention to the publication by this Bureau of Monograph XXXII (Part II) of the Survey series, relating to the Geology of the Yellowstone National Park. It embraces chapters of the descriptive geology of the mountains surrounding the Park plateau, by Arnold Hague and colleagues; elaborate investigations of the petrography of the crystalline rocks, by J. P. Iddings; reports upon the invertebrate paleontology of the Park and the Absaroka range, by Messrs. C. D. Walcott, G. H. Girty and T. W. Stanton; and an exhaustive study of the fossil flora of the region, by F. H. Knowlton.

The volume consists of 893 pages, handsomely illustrated by 121 plates and numerous colored maps and figures. It can be purchased for $2 45—the actual cost of preparation—and payment should be made only by postal or express money order, stamps or checks being not acceptable.

Very respectfully,
CHAS. D. WALCOTT, Director.

Department of the Interior U. S. Geological Survey, Washington, D. C., Oct. 28th, '99.

Mining Operations in the Yukon Basin.

The introduction of machinery into the placer mining operations of the Klondyke region was due to the efforts and enterprise of Capt. J. J. Healy, general manager of the North American Transportion & Trading Co., who, realizing that the streams tributary to the Yukon had not generally sufficient fall and volume of water for placer mining, purchased large boilers, pumps and elevators, and last spring installed them on his properties on upper Bonanza creek and on El Dorado. These pumps were successful in the extensive development of the property, so far as the volume of water was able to handle the gravel extracted, but the operations have shown that the plant is not adapted for the small sluice head of water available during the summer months. The pumps and elevators raised 60% of water and 40% of gravel, but on account of the lack of water the gravel is not handled in sufficient quantities to meet the output of the pumps and elevators.

Upon its introduction the installation was recognized as an experiment, and a single season's operations were scarcely sufficient to determine positively the actual requirements which would meet the conditions found in this Arctic region; but Capt. Healy was so far satisfied with the first experiment in this direction that he now contemplates the introduction of steam shovels mounted on a car and movable on a truck for the handling of a large quantity of material, and to also employ derricks to raise large buckets of gravel to the level of the hydraulic elevators, which will raise the gravel and water to the level of the dumping boxes of the sluices. Electric power generated at a station on the Yukon is also looked to as among the possibilities of next season, this power to be conveyed to the various dredging machines on the tributary streams.

During the coming winter the steam thawing machines will be used to thaw a large amount of ground and pay dirt for washing next summer will be raised to the surface. Although this bedrock gravel is rich in gold, no precaution is necessary to protect it from those disposed to loot the pile of wealth, for in short time after exposure to the low temperature of a Yukon winter it has become a solid mass of gravel and ice.

On the Yukon fair weather usually prevails from May until September, and for nearly two and one-half months there is almost continuous daylight. This has the effect of considerably lengthening the period available for summer sluicing, and is, therefore, an important working factor.

Although industrious search has been made for the source of the placer gold, no gold-bearing veins of great value have as yet been discovered, so that the region still remains practically a placer mining country, though without doubt if the search is continued valuable veins of gold ore will be found.

The creeks on which there is the greatest activity in that region known as the Klondyke are Dominion, Gold Run, Hunker, El Dorado, Bonanza and Sulphur, of which each has tributaries. On each of these creeks there are benches being profitably worked. The fact that gold is found on a series of terraces may be taken as an indication that the gold was not derived from the immediate vicinity in which it was found, but is more likely to have come some distance. The distance which gold found in alluvial may have traveled is not always easy of determination, though its physical appearance is a better index of this than the size of the grains or nuggets. Very smooth gold is usually found at some distance from its source, and another peculiarity is that the more distant from its source the higher grade the gold.

In all of the gulches, whether containing pay gravel or not, the bedrock stratum is overlaid by a deposit of "muck," as it is called, which consists of decayed organic matter, principally moss, with some fine silt. This is found frozen, and is essentially rock, but when thawed it becomes black mud, which may be sluiced away. In depth the muck ranges from 3 to 40 feet. When the ice and snow melt in summer the water is conducted onto a claim covered with muck and the water rapidly thaws it out and it is carried away in the stream, but where deep, shafts are sunk through it to the gravel bed, and through that to bedrock, which is then exposed by a system of drifts and crosscuts, the gravel is hoisted out and sluiced.

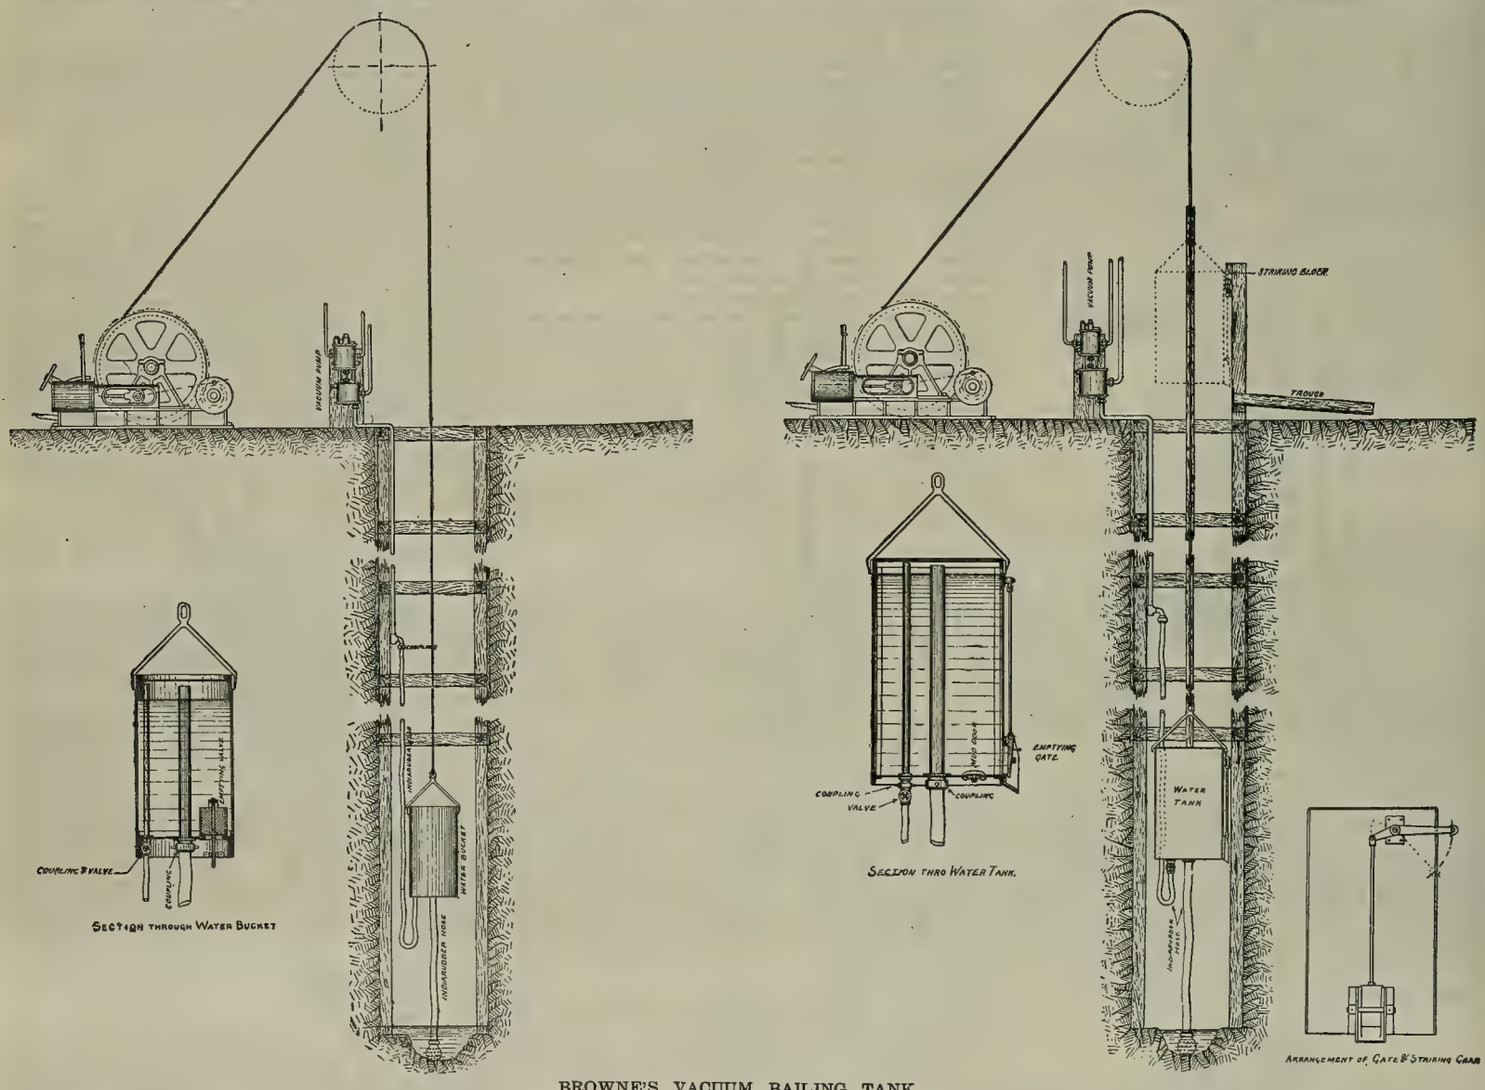
In the first seasons the ground was thawed in the most primitive manner by building large fires, the heat from which thawed a few inches of the muck or gravel, which was removed and another fire started to remove a few inches more. In this costly, laborious and tedious manner all the shafts were sunk, but the introduction of the steam thawing machines has rendered the sinking of shafts comparatively inexpensive, and it will result in a much more extensive system of operations. These thawing machines have limitations, for the heat penetrates only a few inches, but it leaves back of the thawed ground which is removed a solid mass of frozen ground, which stands without timber support, rendering operations simple and cheap as compared with former methods.

Browne's Vacuum Bailing Tank.

This patented device is intended as an economical and effectual means of raising limited quantities of water from a mine shaft while the work of sinking the shaft is in progress. Handling water which seeps and flows when sinking a shaft is frequently a source of delay. Ordinary practice is to lift and force the water to the surface by suction or force pumps. The pump is placed in the shaft 15 to 25 feet above its bottom and draws the water by suction through a strainer and suction hose to the pump cylinder, whence the bucket piston or plunger lifts or forces it upward.

While the work of sinking is in progress, it is not often practicable to more than provide a small sump in the bottom of the shaft for the water to collect in and to pump from, so that the pump must adapt itself to varying conditions, resulting in wear to the reciprocating parts and necessitating frequent repacking, repairs and delays. The pump must also be lowered from time to time as the work progresses, and the water columns and power supply pipes must be extended and reconnected. During blasting operations it must be removed or protected by a bulkhead.

After the shaft is completed a deeper sump may be provided from which the water may be dipped by means of bailing tanks, water buckets or kibbles and hoisted to the surface, but during shaft-sinking operations the maintenance of a sump sufficiently deep to dip from is impracticable.



The vacuum bailing tank herein illustrated was patented by Mr. Ross E. Browne and assigned to Fraser & Chalmers. By its employment the difficulties and inconveniences usually experienced in removing limited quantities of water from the uncompleted shaft are intended to be overcome. The apparatus consists of a large vacuum tank which may be lowered and hoisted rapidly in the shaft by means of an ordinary hoisting or winding engine located on the surface. The tank is lowered to a point near the bottom of the shaft and connected by means of a vacuum pipe leading to the vacuum pump on the surface, which may be driven continuously or intermittently by steam, compressed air, electric current, water power, or otherwise. The operation of this pump produces a vacuum in the tank, which draws the water from the shaft bottom through a strainer foot valve, suction hose and suction valve. When the tank is filled with water, the coupling is loosened and the tank is then hoisted to the surface to be emptied and returned to the bottom of the shaft, where it is reconnected with the vacuum pipe and is then ready for refilling.

The coupling is preferably connected with the vacuum pipe and with the tank by means of flexible hose so as to occupy a position readily accessible to the miner and is most suitably constructed to cut off the air intake when uncoupled and open the same when coupled. Similar couplings are in common use for other purposes at the present time.

The tank is best provided with shoes to run in guides in the shaft; its construction also involves the use of a self-dumping valve operated by a rod passing through a stuffing box at the top of the tank and connected with a lever which is automatically tipped by a stationary guide at the surface, the discharging water being carried through a water trough. Similar arrangements for automatically emptying the tank are commonly used in bailing. Additional hoisting capacity is not required where double hoists are already provided, as is very frequently the case —one for each of two compartments.

The utilization of one hoisting compartment for bailing while sinking as a rule is not objectionable, as shafts generally have two or more compartments, only one of which is used for hoisting the rock from the bottom of the shaft.

The tank is described as specially designed for use in vertical shafts, but it may be adapted to inclines. The patentee and manufacturers consider that this apparatus commends itself by its simplicity. They announce that it lifts air, water, mud, sand, etc., with less than the usual amount of wear and tear, necessitates less labor in handling and is more easily kept in order than many styles of sinking pumps in ordinary use. All desired information concerning the device may be obtained by addressing the manufacturers, Fraser & Chalmers, Chicago and London.

BROWNE'S VACUUM BAILING TANK.

GRADING is under way near the smelter of the Golden Reward Con. M. Co., at Deadwood, S. D., for the construction of an experimental plant to recover values lost in the slag from the furnaces. The investment of $2000 is necessary to build this test plant. The slag dump is estimated to contain 1,250,000 tons with a value approximating $1,000,000. The plant will consist of a reverberatory furnace and the molten slag from the smelter will be conveyed by electric cars and dumped in this furnace, which will require but a small amount of coal to win the value that remains in the slag.

Warming Quartz Mills and Battery Water.

In quartz mills located in cold countries or where the temperature falls to low point during winter, the water used in the batteries, coming usually from open conduits, is reduced in temperature to a degree nearly equaling that of the atmosphere. Good amalgamation cannot be accomplished with water at temperatures approaching the freezing point, and some method of heating the water should be employed. In most mills so situated steam is used to supply motive power. The exhaust steam from the boilers can be employed with great benefit in a number of ways. First it can be utilized in heating the feed water going to the boilers themselves, thereby greatly reducing the cost of making steam. After having accomplished this the exhaust steam still retains a large amount of heat which can be utilized in warming the battery water, in the same manner as in heating the boiler feed water. By a proper arrangement it may also be made to heat a large volume of air in a receiver and this air can be driven through large iron pipes, 30 inches in diameter, which can be placed along the floor of the mill in front of the battery plates or on the concentrator floor. The pipe should be made so as to be easily put together or disconnected, so that upon the approach of cold weather it may be put in place and when the winter is over it may be removed. It will thoroughly warm the mill, and not only make the men comfortable, but pay for itself in the increased saving of amalgam. Exhaust steam may be used in place of the hot air heater for the mill in places where the temperature does not fall too low, but where the mercury drops far below zero, as in Montana, South Dakota and in the high altitudes of California, Colorado and elsewhere, the condensation is likely to cause the pipes to freeze up, adding new difficulties instead of lessening those which already exist.

What Many Men Constantly Say.

MARTINEZ, ARIZ., Oct. 14th, '99.

Publisher "Mining and Scientific Press," San Francisco, Cal.: I enclose $3, for which please renew my subscription for the MINING AND SCIENTIFIC PRESS. I find that it is to me the most valuable paper published—one that mining men and prospectors cannot well do without, and a paper that is valuable in every pursuit of mining business.

Yours respectfully, J. ANDRE NEWMAN.

Mining Summary.

ALASKA.

The Yukon river is reported closed by ice.

The monthly report of the Alaska Treadwell mine, issued October 27th, shows 540 stamps crushed 58,407 tons yeilding $68,646, with a saving of 1,083 tons sulphurets worth $30,178. The ore averaged $1.83 per ton. Gross receipts for the month were $107,087, and expenses $36,500. The fourth quarterly dividend of the company was paid October 28th, making $300,000 given to stockholders since January 1st. The dividends are 37½c per share quarterly.

At Cook Inlet Blackwell & Webber propose putting in development of two miles of Indian river, one of the tributaries of Turnagain Arm. Blackwell says he has completed the building of a dam 380 feet long across Indian river 3000 feet from its mouth. In the dam are two gates, one 16 feet wide and 10 feet 8 inches high, the other 7 feet wide and 9 feet high. The gate opens automatically with a flow of 4500 miners' inches, requiring fourteen minutes to exhaust the dam water, which it takes six hours to fill. Next season he hopes to have washed the three-fifths of a mile of river to bedrock and begin taking out gold.

R. C. Norman, who has been running a rocker on the Cape Nome beach, says he left there on October 6th on a steamer carrying 300 men, the trip to Seattle taking ten days, and the cost of passage amounting to $100, $75 or $50, according to first cabin, second cabin or steerage. Many of the passengers expect to go back next year, but think they can easily pay passage both ways and then make money, in preference to wintering at Nome, where house room is scarce and where hotels charge $4 a day for board and lodging. Mr. Norman thinks there is good pay dirt along the beach for a distance of thirty miles, but it takes judgment and experience to make "rocking" a success. Miners who used rockers made from $5 to $50 per day last summer, according to their knowledge of the business. The gold is very fine, and difficult to save, unless one knows how. All the rockermen are obliged to use quicksilver, which is placed in the bottom of the rocker and kept there by careful manipulation, until it has amalgamated a considerable quantity of gold, when the amalgam is taken out and the mercury dissipated into the air by placing the amalgam in a gold pan and holding it over a fire. Quicksilver is worth $1.25 a pound at Anvil City, and a pound will gather $1000 worth of "flour gold" if properly handled. Beach mining is usually pursued by two men, who work together as partners and "batch" in a tent or cabin close by. A good many cabins have been put up in the vicinity this fall, as lumber can now be procured at $125 per M. Scarcity of fuel is being overcome by the importation of coal, which sells for $75 a ton, and miners who decide to remain there all winter can keep from freezing to death by building tight cabins and laying in a supply of coal. Navigation has been closed since Oct. 15th.

ARIZONA.

The Arizona Copper Co. produced in '93, 7,871,819 pounds, and in '98, 18,169,096 pounds. The production of the Copper Queen in '93 was 13,795,618 pounds; in '98, 33,749,390 pounds. The Detroit produced 4,942,728 pounds in '93, and 11,428,992 in '98. The production of the United Verde in '93 was 9,121,146 pounds; in '98, 42,323,926 pounds. The total production of copper during the period mentioned increased from 43,773,675 pounds to 110,823,864 pounds. The '99 production is expected to reach 140,000,000 pounds.

COCHISE COUNTY.

Silver Belt: The Copper King Co., at Barrett, in the Dragoon mountains, has blown in a thirty-ton smelter on ore obtained from the Golden States mine. The Copper King Co. commenced operations at Bisbee four years ago, capitalized at $5,000,000, and owing to its near proximity to the Copper Queen and a judicious expenditure of money in printers' ink, both in and outside of Arizona, succeeded in disposing of a large amount of stock. The Bisbee holdings have been practically abandoned—save the name.

GILA COUNTY.

Globe *Silver Belt*: The United Globe furnace sprung a leak last week, and Supt. Cook suspended smelting until a new furnace has been erected. Forty men were laid off. Smelting will not be resumed before the new year. Work in the mines continues.

Globe *Silver Belt*: The Helvetia M. Co. contemplates building a narrow-gauge road from the mines to the smelter, an eighteen-mile line from the mine to Vail's station, on the Southern Pacific. It is reported that an additional smelter of 150 tons capacity will be erected, making 350 tons daily capacity.

GRAHAM COUNTY.

The Grand Reef mine, J. W. Mackay, has developed to that extent that a reduction plant is said to be the next move of the management.

Arizona *Star*: The wolfram claims sold to Mr. Bradford by Sampson & Bent are being worked by a New York company, Mr. Alcott president. They are in the Guijas mountains, six miles north of the Cerro Colorado mine. The owners of the property are grading and preparing to erect a concentrating plant.

MOJAVE COUNTY.

Several members of the Temple Bar Con. M. Co., who recently arrived in Kingman from Paris, have gone to Temple Bar, on the Colorado river, to inspect their property, which consists of placer ground.

Kingman *Miner*: Murphy & Hawkins have sold to M. L. Requa and M. D. Rochford their interests in the Champion, Twins and Blue Lode mines at Cerbat. The mines show big bodies of lead sulphides.——J. H. Johnson has bonded to W. H. Cushing the Stockton mine on Stockton hill. The mine is the north extension of the Prince George. The vein shows a large body of quartz carrying good values.——The Tennessee mill is turning out a carload of clean concentrates daily.——The reported strike in the Alpha mine is confirmed. The sample from 52 inches of ore gave a value of $25 in gold and silver and 12% copper. Ten inches of ore on the foot wall gave 32% copper. The dump ores that were considered worthless gave thirty-five ounces silver, $6 gold and 19% copper. Of this character of ore there are fully 1000 tons. The Nay Bros. have taken a lease below the tunnel level.——Caffery & Dennis will begin shipping several hundred tons of copper ores.

PIMA COUNTY.

Tucson *Star*: The Dragoon M. Co., operating the Peabody copper property at Dragoon Summit, has become one of the largest shippers of high-grade ore to the El Paso Smelting Works.

PINAL COUNTY.

A new water jacket has been put in at the Silver Bell smelter, twenty-five miles from Red Rock station, on the Southern Pacific. This is known as the Old Boot mine, which was operated in early days for silver, but is now a copper producer.

YAVAPAI COUNTY.

G. P. Harrington has men at work on the old Tiger mine in the Bradshaw mountains and three teams are hauling ore for shipment.

Phœnix *Enterprise*: J. M. Ford has his gasoline engine in place at the Copperopolis mine. Ten men are employed.——At the Whipsaw property a large force is employed. The old shaft is being driven deeper and several prospect shafts will be sunk. Supt. Farrish has put additional men to work.

YUMA COUNTY.

A 6-foot ledge of 24% copper ore has been uncovered near the King of Arizona mine.

CALIFORNIA.

Alameda.

Oil has been discovered on the Miner ranch at Orinda Park, ten miles from Berkeley, at a depth of 800 feet.

Amador.

Amador *Record*: Rich rock is being taken from the 1550-foot drift of the Central Eureka mine on Sutter Hill and crushed in the Zeile mill.——Work is being pushed at the Fremont Con. (Gover) preparatory to opening up the mine. The hoisting machinery, which stood close to the old inclined shaft, will be moved. This shaft will be opened and a new one sunk 1600 feet to the south. The old workings are 1362 feet on the incline. A large body of quartz is exposed in the lower workings.

Calaveras.

At the Melones mine, near Robinson's Ferry, work is temporarily shut down, except on the tunnel and mill. Nearly 150 men have been laid off. Work on the dam had to cease on account of the volume of water in the Stanislaus after the storm.

Angels *Echo*: The Stickle mill, at Angels, is undergoing repairs. New mortar blocks are being put in to replace the old ones.——The motors for operating the Utica Co.'s mills by electricity are being put in the Stickle, Madison, Utica and Gold Cliff mills. This will result in a saving of several thousand inches of water.——The wing dam of the Melones M. Co., on the Stanislaus river, has been blown up by the company to prevent the destruction of their ditch and flumes during the heavy rain storm. The dam was built 4 feet high and extended across the river 160 feet.

San Andreas *Prospect*: At the Brunner mine, south of Angels, in crosscutting on the west side of the shaft it is reported that fine rock has been struck.——At Campo Seco, fire was again started in the old smelter of the Satelite mine, and 100 men are given employment. The supply of coke gave out and work was temporarily suspended, pending the arrival of ten carloads. The smelter has a capacity of fifty tons of ore in twenty four hours, but it is reported the company will erect a new one with a capacity of 100 tons. B. G. Randall is Supt.

San Andreas *Citizen*: The Blair G. M. Co. have sold their Maggie Bell quartz claims, in Angels mining district, to the Libra M. Co.——During the week the Utica Co., through C. D. Lane, bought the Bennett-Leeper mill and the site for $679 40. Alvinza Hayward, C. D. Lane and Hobart Estate Co. have bought from J. Cronan a one-fifth interest in the Confidence quartz mine. The Confidence adjoins the Utica and it is said that the Utica Co. now own the property in its entirety.——The Shirly Queen quartz mine, on the Oxendine farm, near Copperopolis, has been sold to C. A. Ducommun, representing Los Angeles capitalists. The mine has been worked, and the people who have bought it have been working it under a bond. There is a 5-stamp mill on the ground.——The Kremer drift mine, on the Mokelumne Hill and Valley Spring road, has been sold to J. K. Carpenter of Oakland. This mine was owned by Cook and Burleson.

Jackson *Ledger*: At the Union copper mine, at Copperopolis, the pumping out of the water from the old workings is under way. It is estimated that it will take two to four months to unwater the mine. The mine was filled to within a few feet of the top. All water taken out will be run through sluice boxes and vats, where the copper in solution in the water will be precipitated on tin scrap with which the boxes are filled.

Stockton *Independent*: The Lightner M. Co., at Angels, have expended $300,000 in developing the mine and making necessary improvements, of which amount the mine produced three-fourths. During the past year the company expended $120,000, of which the shareholders furnished $30,000.

Del Norte.

Del Norte *Record*: McGowan & Crawford have fifteen tons of copper ore ready for shipment at the Copper King, on Myrtle Creek hill. It will be sent to Selby's via Crescent City. The owners report that in the shaft and tunnel there is a large amount of ore uncovered.

El Dorado.

The Melton mine at Poverty Point has started up under lease to a local company, of which J. Fuller is foreman.

At the Mt. Pleasant mine, A. L. Begbie, Supt., is increasing the working force.

Georgetown *Gazette*: At the copper mine near Pilot hill a number of men are employed putting up buildings and opening the mine. It is claimed that the ore goes 40% copper and $15 per ton gold.

San Andreas *Citizen*: The Ritter quartz mine has been incorporated for $100,000. The mine is three miles from El Dorado. Within the past year Mr. Rigney has been developing the mine by means of a tunnel, which is now in 380 feet; at a depth of 200 feet good ore is in sight.

Lake.

Middletown *Independent*: Lobree & Betts are pushing a drift into their copper mining claim on Pine mountain, and prospects are reported good.

Lassen.

Susanville *Mail*: The tunnel of the Hayden Hill Tunnel Co. is in 120 feet. Mr. Frick is Mgr.——The Hayseed Co. is employing a crew of men in development.——The first rich sulphurets ever found on Hayden Hill have been discovered in the Monte Cristo tunnel, owned by Dr. Schloesser and Geo. F. Stone, at a depth of 1020 feet.——Work continues in the Juniper mine by McFarling Bros. and Judge Ritchie.——The vein on the 220, 300 and 400 foot levels, west, of the Golden Eagle mine is now 30 feet wide and in good ore.

Los Angeles.

The King of the West mine, at the side of the S. P. Railroad, half a mile west of Acton station, has shipped a carload of ore to Selby's works at Port Costa. The ore contains copper, gold and silver.

Mariposa.

It is reported that the Washington mine, owned by M. L. Rodgers, two and one-half miles northeast of Hornitos, is to be reopened. This property consists of three claims, and is in a black clay slate country. A dyke of gray rock accompanies the vein. The old workings are 1500 feet deep and it is said the mine has a record of $1,500,000.

Mariposa *Gazette*: At the Princeton mine preparations are being made to set the boiler, compressor and engine. One of the boilers and the hoisting engine have been delivered. A redwood tank, with a capacity of 15,000 gallons, is erected at the Princeton. The water is brought from the spring on the mountain east of Princeton in a 2-inch pipe.

Mono.

Bridgeport *Chronicle*: C. E. Watson has taken the management of the property of the Aimono M. Co., in Antelope valley. A mill will be put in in the spring.——A number of locations for oil on the islands in Mono lake have been recorded at the courthouse recently.——W. P. Brandon has moved a 5-stamp mill from Bodie to the Cameron mine, on Green creek. R. A. Cameron has opened up the mine. Bridgeport has three quartz mills in its vicinity—the Castle Peak, Arnot and Cameron.

Nevada.

Penrose & Harker's new restraining dam at Relief hill is nearly completed, and they expect to mine there next winter under supervision of the Debris Commission.

The Spanish mine, three miles north of Washington, has been closed down. For years the mine has been worked by means of an open cut and made a profit on rock that returned 75 cents per ton. The cut has got so deep that the property cannot properly be worked in that way any longer and it is said the rock will not pay to work through a shaft. The stated cost of mining and milling the rock from this mine was for some years about 60 cents per ton.

Grass Valley *Union*: At the Plumbago mine, Supt. Mather is pushing the work of erecting the additional twenty stamps on the Middle Yuba. The mine continues to yield rich ore.

Placer.

Auburn *Republican-Argus*: E. G. Spencer reports that a rich deposit of gold-bearing ore has been opened on the A. E. French place, near the Algol copper mine. The gold is of a copper color.——It is reported that parties have lately bought 800 acres below the Karchner ranch in the Valley View district, supposed to be a part of the original bed of the Bear river, and will work the ground by dredging. The parties purchasing are from Oroville.

Auburn *Herald*: The Michigan Bluff M. Co., incorporated, has bought the Burns Con. Mexican placer mining claim at Michigan Bluff. The former owners ran a tunnel and struck the channel on the rim. It is now proposed to run a new tunnel 40 feet below the channel and open it, so it may be worked throughout its full length on the ground owned by the company.——The Bullion shaft, Ophir district, under its new owners, has been sunk 10 feet and is down 160 feet. The ledge is of ribbon rock 4 feet wide at the bottom of the shaft and shows good ore. The company has ordered a new hoist from the Union Iron Works. Sixteen men are at work.——At the Boulder, near Ophir, they are preparing to put in an air compressor. Two concentrators have been ordered.——A. Clarke is preparing to put up an air compressor at his Georgia Hill mine.——Laird & Quinn Bros. are cleaning a ditch preparatory to sluicing the ravine on P. Snyder's farm. They have a mile of pipe laid.

Colfax *Sentinel*: The Gold Channel M. Co., whose mine is near Emigrant Gap, are doing successful work in their shaft. They struck gravel at the end of a 100-foot drift recently, and are sinking now to bedrock. The mine is under the management of F. W. Armstrong, formerly of the Big Dipper, near Iowa Hill.

Plumas.

Quincy *Bulletin*: T. Richards has bought a half interest in the Pioneer drift gravel mine, on Bear creek, owned by Mr. Buchanan, and men will be put to work.——The late storm placed 5 feet of water in the storage reservoir of the Quincy Mining & Water Co., known as Silver lake, at the base of Spanish Peak, which is an indication of the heavy rainfall of last week. It is the intention of the company to resume mining at Bean hill.

Quincy *Independent*: W. S. Chapman has a bond on the Johnny Bull mine, in North canyon. Mr. Chapman will put men at work to develop the property.

San Bernardino.

J. Dederichs has designed the stamp mill for De Lamar's Gold Mountain mines at Blairstown, near Holcomb valley. The mill is to have forty stamps, with space for sixty.

Santa Barbara.

The Summerland Oil Co.'s October shipments will go over ninety carloads. Eighty carloads is the usual monthly output.

Lompoc *Record*: It is reported oil development will begin near Gaviota Pass. It is said that options have been taken at a cost of $10,000 on lands sixty miles north of Santa Barbara. This would reach the Lompoc property.

Shasta.

(Special Correspondence) —Behrens & Lievsay continue sinking the shaft on their Oro Fino mine, near Shasta. Like the Mt. Shasta mine previous to the present operators taking hold, the Oro Fino has been several times abandoned. To-day it has an ore body at 225 feet depth that is of good shipping grade.

F. M. Archer is developing a copper property on McCloud river from which the croppings assay 6% copper and $1.80 per ton gold.

Ried & Clendenin, in Old Diggings district, are developing six claims, on which they have an aggregate of 1000 feet of tunnel. The ore body is from 5 to 12 feet wide and averages $7 a ton.

Work continues with good results on the Rabbit mine in Muletown district. This property is yielding gold by the hand mortar process.

Work has been suspended on the Afterthought copper mines at Furnaceville by the Tarbet Syndicate, pending negotiations for an extension of the bond for six months. The company has paid $10,000 on the purchase price and has had above twenty men employed nearly two months.

At the Mt. Shasta mine the force has been temporarily reduced pending the installation of heavier hoisting machinery.

Redding, Oct. 31st, '99.

Redding *Free Press*: F. E. Ware, Mgr. of the Mt. Shasta mine, states that thirty men are employed at the Mt. Shasta mine. They are drifting on the 300 level and stoping. The work of sinking the shaft below the 300 level is delayed because of limited hoisting capacity. Since Mr. Ware and his partners bought the Mt. Shasta a year ago the product has amounted to $95,000. Previous to that time $12,000 had been taken out.——Brake, Wylie and Sleezer, who found the New Discovery quartz mine, in Churntown mining district, have been working the claim for several months, and they say that the first shipment of ore to the Keswick smelters, amounting to twenty-one tons, averaged $42 per ton, and another shipment is ready.——A. J. Oswald, Supt. of the Midas mine at Harrison gulch, states that the new roasters, which were started up for the first time ten days ago, are a success. The roasters are an experiment. Supt. McGill has charge of the cyanide works. Ten stamps are being added to the 10-stamp mill. One hundred men are employed in the mine and seventy at the works.

Siskiyou.

A strike is reported in the Golden Star or old Spencer quartz mine on Humbug. The ledge ranges from 18 inches to 2 feet in width and prospects $200 to the ton. Hollister men form this company.

The reported striking of bedrock in the Greenhorn Blue Gravel No. 2 mine seems to have been premature, as it is thought the supposed bedrock may be a boulder. The shaft is down 40 feet deeper than in the No. 1 Blue Gravel mine.

The Mabel quartz mine and the new ledges lately prospected on McKinney creek, between Oak Bar and Scott Bar, are reported showing rich ore.

Yreka *Journal*: The Commodore quartz mine at Barkhouse creek, Klamath river, has a paying ledge averaging from 3 to 4 feet in width.——Managers of the Yreka Creek mining enterprise have been viewing the ground lately and making arrangements for commencing operations as soon as the dredger arrives.——Collins & Campbell, at Oak Bar, are taking out good pay gravel, making $50 a day.——The China Co. at Buckeye Bar, above Oak Bar, has been taking out rich gravel lately.——The Greenhorn No. 1 claim of Page & Co. continues to yield good pay, with a full force working day and night. Later they will sink a new shaft or raise to the surface at the end of their tunnel.

Etna *Advance*: Work will be commenced at the China Oak mine, at Happy Camp, recently purchased by W. H. Van Brunt. The flume, to carry water to the mine from Indian creek, is to be completed by Jan. 1st.

Sonoma.

Cloverdale *Reveille*: The Cloverdale quicksilver mine is working steadily, and considerable ore is turned out daily. F. Lawley says the first shipment of fifty flasks will be made next week. This mine, when working full force, will employ a large number of hands.

Press-Democrat: At the Great Eastern quicksilver mine a number of additions and improvements have been made. During the past month a 60 H. P. hoisting engine has

been installed at the main shaft, also a smaller engine for sinking prospect shafts. The main shaft is 500 feet deep, from which there runs a drift 435 feet in length. Two roasting furnaces are in operation, that for coarse ore having a daily capacity of 28,000 pounds and that for fine ore 36,000 pounds. The soot from these furnaces contains condensed mercury, which was formerly mixed with fresh charges of ore and roasted a second time, but is now treated separately in a large retort recently added to the plant. A cleanup of the furnaces is made monthly, and the record for last July, August and September was 230, 235 and 228 flasks, respectively. There are fifty men employed at the mines.

Trinity.

Trinity *Journal*: A. Wagner has men working his quartz mine. The mine is equipped with a mill, which is running steadily on good ore.——Work is progressing on J. C. Steele's quartz mine, which is equipped with two mills, concentrators and rock breakers. The machinery is run by water power. The mills are running on free-milling ore. The richest ore, which is base, and the concentrates are shipped to Selby for treatment. Last week $5000 worth of sulphurets were shipped.——The Black Eagle quartz mine, owned by A. Miller, is showing up well. H. Weldon is the Supt.——At the Yellow Rose of Texas on Union creek development work is being pushed. A mill will be erected and a wagon road will be built up Swift creek to haul in the mill. It is owned by Carr & Miller.——R. D. Lawrence is running the arrastras on his tellurium properties.——At Cinnabar large shipments of quicksilver are being made from the Altoona. Good ore is being taken out and reduced under Supt. Porter's management.——At the Integral quicksilver mine Supt. Laws is developing.

Tuolumne.

At the Santa Ysabel, near Stent, work on the new mill is making good progress. The new hoist, which will carry down 2000 feet, has been finished. The ore at the 6th level, according to last reports, has widened to 3 feet.

Sonora *Union-Democrat*: The Free Lance is near the Berger ranch, one and one-half miles above the Ward's Ferry bridge. The mine was discovered and worked by F. Greiner Sr., who bonded it to Gardner & Meyer for $6000. Recently the purchase price was paid. The workings consist of two tunnels, one in 180 feet, the other 360. The vein in each varies from 1½ to 3½ feet, carrying high-grade ore. Grading for a 5-stamp mill is in progress.——The Sonora & Duffield mine at Arrastraville is being reopened.——The Laura mine at Cherokee is sending high-grade ore to the mill.——The Providence is operating ten stamps. Twenty men are employed.——The twenty stamps at the Grizzly were started Tuesday. For some time previous only five had been going.——The Rawhide has started operations full-handed. Electricity furnishes power.——The Golden Gate started up Tuesday after a brief shut down. This mine is favorably located to obtain water after other properties are forced to close down for the lack of it.——The Jumper is running full blast. During the water famine ten stamps were kept dropping by steam. With resumption of operations the force of mine and mill has been increased.——Fifteen miners are at the Green mine, near Confidence, retimbering. The mine has been unwatered and cleaned out.——The Continental mine, owned by Wm. Johns and situated near the Keltz, was bonded last week to Robert Stevenson of San Francisco and C. B. Taylor of Berkeley. Operations will begin in two weeks under supervision of A. S. Graham.——Work at the Kincaid Flat gravel mine, which was discontinued several weeks ago, will be resumed.——The Toledo mine, one mile west of Tuttletown, is being operated under a bond by E. T. Gould and others. This mine is an old one, though long abandoned. The shaft has been cleaned out and drifting commenced on a vein 8 feet in thickness. This mine produces a high-grade arsenical sulphide which gave some difficulty to the former operators in saving the values. Some of the ore of this class contains over $1000 per ton.

Sonora *Independent*: The Arbona mine, at Tuttletown, is down 487 feet. A vein 3 feet wide shows at the bottom of the shaft, the ore sprinkled with free gold. At 500 feet drifting will be commenced north and south. As soon as the mine gets power to run the 10-stamp mill, there is enough ore at hand to keep it running continuously.——At the Draper mine, near Soulsbyville, the compressor, receiver, air drills, etc., are ready for use. A double shift is sinking. A new mill will be erected within sixty days. Grading is in progress.

COLORADO.

BOULDER COUNTY.

The Inter Ocean mine at Sunshine has commenced shipping high-grade ore.

The Victoria and Lucky Star are making regular shipments of high grade ore.

The tunnels on the Big Five property are all being pushed and 1650 feet farther will put the N1 Wot branch 700 feet underground on the Columbia vein.

In the 100 level west the Cross mine at Ward has opened a 2-foot streak of iron in the foot wall, which is making toward the streak in the hanging wall, also 2 feet wide.

John Knight and others of Ward have opened bodies of wolframite in their claims east of town,

CHAFFEE COUNTY.

The Salida M. & S. Co. is figuring on buying and refitting the old Salida smelter, built to treat the Sedalia ore.

The Famous mine at Camp Harrington has opened 10 feet of ore with a mixture of jasper and hematite that carries gold.

CLEAR CREEK COUNTY.

The lessees on the Brazil mine, near the Lamartine, have struck 6 to 18 inches of ore that will run 100 to 300 ounces in silver per ton.

The Maxwell & Hood tunnel has struck the Griffith lode and opened up a large body of iron and galena.

The Dunkirk mine has been leased by a Denver company, which will work it through the Diamond tunnel. The old drifts are being cleared out and repaired. The mine was formerly a heavy producer.

The Newhouse tunnel has installed the largest blower in the State. It discharges 63 cubic feet of air per revolution and has from 120 to 200 revolutions per minute.

GILPIN COUNTY.

The Gunnell Co. will commence shipping to the Black Hawk mills.

In the West Notaway mine the water is held at 425 feet, and drifting is in progress east and west at that level. A good body of smelting iron has been encountered. The station pump will be put in.

HINSDALE COUNTY.

(Special Correspondence).—Lake City, the county seat of Hinsdale, is situated in the narrow but picturesque valley of Lake Fork, an affluent of the Gunnison. Three miles up stream from the town is the lake known as San Christoval. It is three to four miles long, half a mile wide, and is continually fed by the springs and melting snows from the lofty spurs of the Continental divide.

On Hotchkiss mountain, overlooking this lake, is the group of tellurium-bearing mines, the chief of which is the Golden Fleece, whose development is extensive and production of rich ores makes a fine record. Among the others are the Black Crook, Hiawasee and Emerald Isle.

Up Henson creek are the silver-lead producers — the Hidden Treasure and Ute & Ulay. Farther up the same creek are the Star, Ocean Wave, Frank Hough and Czar. Following up Lake Fork are the St. Jacob and others at Carson and the Tobasco near the crest of the range. Henson creek and Lake Fork head near the Continental divide, each making a semicircular curve, meeting at the point near where Lake City is located, and the two forming an elliptical area within which are Hotchkiss, Engineer and other mountains of note.

The Hidden Treasure mill is run by water power. The same power operates an air compressor for drill power and a dynamo for an electric hoist at the mine, a mile away, the shaft over which the hoist operates being 750 feet deep, with sinking continuing. The tramway line, operated by water power also, is 4000 feet in length.

The Ute & Ulay treats 125 to 150 tons per day at its concentration mill, which reduces six tons to one ton, making a concentrate containing 60% lead. This is a heavy silver-lead ore. Supt. M. A. Nicholson states that a new tunnel is being started, 2500 feet of which will be on the vein. The new tunnel will be 500 feet lower than the old workings, an interior shaft in which sinks 175 feet by the side of the vein, with crosscuts to it.

The Golden Fleece mill is ready to start up. It is equipped with crushers, rolls, jigs, Frue vanners and Wilfley tables. The Golden Fleece tunnel, which is to cut the mineral ledge diagonally, starts about 100 feet above the surface of the lake and is in about 100 feet. It is expected to cut the ore body at about 3000 feet from the tunnel entrance and 400 feet below the present lower workings.

The Tobasco group, situate near the top of the range, above Lake Fork, is at an altitude of 13,500 feet. It is developed by a 475-foot drift along the footwall, with several crosscuts from the drift through the ledge, which is said to be 30 feet wide, carrying values of about $15 per ton. The ores are an arsenical iron, with rich streaks of tellurium. The property is owned by the Tobasco M. Co., of Indianapolis, Ind., and is in charge of R. L. Ray of Lake City. It is believed the conditions as found in the Tobasco are characteristic of that locality. There are said to be promising prospects on other claims as well. The State road, being built from Lake City to Silverton, passes near the locality.

In American basin platinum has been found, and in little streams flowing from the range free gold can be panned. Prospecting at that high altitude has resulted in finding free gold, tellurium, copper, galena and lead sulphate and arsenical iron.

The Czar, near Capitol City, is shipping three to four cars per month of ore carrying gold, copper, lead and silver. Some of it runs 45% lead; other portions are said to run half an ounce gold and 15% copper.

Pierce & Kilvert are developing the Star, on Henson creek, by a crosscut tunnel. It is claimed they have a body of silver-lead ore of good value.

The Ocean Wave group of several claims, belonging to A. E. Reynolds and associates, is about three miles above the Ute & Ulay, the ledge on which outcrops a distance of about 7000 feet. A tunnel starts at the level of Henson creek, crosscuts the formation and has been driven about 500 feet. The ores are galena and gray copper, with main values in silver, lead, gold and copper. J. J. Abbott is in charge of all of Mr. Reynolds' interests in this district. A company, at the head of which is A. E. Reynolds, is running into Hotchkiss mountain, near the tunnel of the Golden Fleece. Another enterprise, with which Mr. Reynolds' name is connected, has for its object the construction of a dam across the stream at the foot of Lake San Christoval, raising the water in the latter an additional height of 15 feet, creating greater fall for power, and developing electrical energy to run mills and mines.

Engineer mountain, near the point where Henson creek heads, is attracting some attention. Extensive ledges of ore are believed to have been found, though development work is yet slight. The Frank Hough mine, however, has produced about 2000 tons of high-grade copper ore in sulphide form.

The Lillie mine, being worked by the Red Rover M. Co., comprised of Boston men, is in charge of D. A. Farrell. A crosscut tunnel has been started to cut the vein at 600 feet depth.

WASCOTT.

Lake City, Oct. 21st, '99.

LAKE COUNTY.

Developments in the Penrose show that the ore body is 250 feet wide and from 35 to 40 feet thick, with the breast of the drift 200 feet from the shaft and still in ore. It has been estimated the ore in sight is worth $2,000,000. The Smith-Moffat people drove a drift north 700 feet and another northeast. The ore body lies in the angle between the two, and it was missed by the former operators, who gave up the Penrose and Bon Air leases. In the Bon Air the company are working in virgin ground from the Bon Air shaft. Recently the ore body widened to 4 feet, with ore on both sides of the drift. Assays from this strike gave 360 ounces silver, 40% lead and an excess of iron. The ore is hard carbonates, with chlorides thickly distributed in the ore body, some of the pieces are green with chloride incrustations.

Denver *Republican*: The Revenue No. 1 shaft has been equipped with a large sinker, and when the water is out sinking will be resumed.——A new shaft is to be sunk on the Lady Jane claim of the Chippewa lease. The present shaft, now down 575 feet, is 40 feet in a contact carrying low-grade gold and silver ores. The new shaft will be put down 500 feet.

Leadville *Miner*: The Humboldt and Adelaide mines, on the Adelaide park slope of Breece hill, are among the oldest producers in the district and have been worked spasmodically. A large amount of lead carbonate has been shipped from the upper contacts. These oxidized ore bodies change to sulphides at depth. The lessees of the two claims have a joint agreement to unwater the lower levels and pumps have been installed at the 400-foot level of the Humboldt which will lower the water in both the Adelaide and Humboldt. On the 440-foot level of the latter is a large body of copper-iron sulphide which samples eight ounces silver, .25 ounce gold and 4% copper, and would not pay formerly. The Humboldt is worked under lease by Dr. J. S. Sullivan and E. E. Hinckley, who are also operating the Lonsburry shaft. The Adelaide is leased by Dyatt, Meyer, Polkinghorn & Maxwell.——The A. M. W. Co. have enlarged the Wolftone shaft to the 720 level, also enlarged the station at this point in the shaft, which is 35 feet above the body of water now filling the workings of the Maid of Erin, Adams and Wolftone mines. The fine equipment of pumps and engines for the property have been delayed owing to the scarcity of iron. The present engines at the Wolftone will be installed at the Midas shaft.

Carbonate Chronicle: The Penn mine at Leadville is making an output of 120 tons daily of fine ore, a portion of which runs five ounces gold. It comes from the Nos. 2 and 3 shafts, the latter being 230 feet deep. There are large bodies of smelting ore in sight and little stoping is necessary, the drifts being driven through the masses of ore, which, according to Mr. Sullivan's theory, are segregated bodies in the porphyry.——The Superior shaft to the northwest of the Penn is now going down rapidly.

MONTROSE COUNTY.

Norwood *Leader*: Another copper lead has been found in the Paradox district, showing good values on the surface. It was discovered by Winters & Peterson of Pinion while making a survey. Coal was also discovered in the vicinity. The lead is traced on the surface for a mile, and is nearly parallel with the Paradox valley and two miles south. This lead is found in sandstone.

SAN MIGUEL COUNTY.

Telluride *Examiner*: Shipments for the past two weeks have averaged fifteen cars per week, and this record will be maintained during the season, as nearly all the properties producing during the summer are in shape to continue. The shippers were as follows: Alta 4, Attica 1, Befield 1, Butterfly 4, Carribeau 12, Montezuma 3, Silver Bell 2. Total, 27 cars. The shipments from the Carribeau and Butterfly consist of concentrates.——Since the beginning of winter weather the Liberty Bell people have abandoned building their power plant this fall, but instead will push to completion the 40-stamp addition to the mill. Forty stamps are now dropping in the completed portion of the mill. An order has been placed with the E. P. Allis Co. for the stamps of the new addition, the order for concentrating apparatus being withheld until it is further determined whether Wilfley tables or vanners are the more desirable for the ore to be treated and also to await results of experiments being made in cyaniding the ore.

TELLER COUNTY.

J. M. & F. B. Hower of Buffalo, N. Y., are looking for a suitable site to build a new cyanide mill to cost $100,000. It will have a daily capacity of 150 tons. Florence, Colorado City and Cameron are each endeavoring to secure the plant.

It is reported that another strike has been made at the Isabella mine. A 6-inch seam of ore carrying high values was opened at the ninth and tenth levels, 800 feet from the Lee shaft. A similar strike was made in January, when values of $150,000 per ton were uncovered. The Isabella was considered worked out when taken by Chicago and Boston capitalists. Since the reopening of work on it several good strikes have been reported.

A rich strike is reported in the Union gold mine at Cripple Creek. Some time last winter a streak of very rich ore was encountered in the mine, from ¾ of an inch to 1¾ inches in thickness. Ever since the streak has been rich, though no gold has been found native. Within the last few weeks, however, the streak has been widening and growing richer, with occasional fine streaks of free gold.

The gold output of the Cripple Creek district in October was $2,001,600. This is the first month's production that has exceeded $2,000,000. It is estimated that the total for the year will reach $18,000,000.

Victor *Record*: Whipp & Glenn have another strike in their lease on the Lansing. They have already cleaned up over $60,000. In the second level, south 140 feet from the shaft, the drift, after passing through low-grade mineral, is again in big pay, assays going ten ounces. In the upraise started 57 feet south of the shaft and in the winze from the first level the same shoot is found. In the second level there is now known to be an ore shoot 75 feet, measuring vertically, and over 100 feet in length. In the third the vein has been drifted on 25 feet, and to-day 4 feet of ore is exposed, good for three ounces to the ton. The stopes in the first level are producing forty tons daily. The lessees have shipped 629 tons since Oct. 1st. which will average five ounces.——A contract has been let for 50 feet of sinking and a like amount of drifting on the Little Johnnie, on the southwest slope of Beacon hill—a claim owned by the newly organized Little Johnnie Co. In the bottom of the 35-foot shaft there is a vein, 18 inches of which sampled fifteen ounces to the ton. The balance of the vein is low grade.——The output of the Portland for October will aggregate 5000 tons of a gross value of $300,000. Stoping has been started at the 900 level. The pumps are raising from 700 to 800 gallons a minute.——Stoping has been started on the 500 level of the Burns of the Acacia Co. Shipments will be raised to fifty tons a day, and the grade will also show improvement. The first-class ore is running from eight to twelve ounces and the second $30 to the ton.——The Eclipse Co. have started unwatering the main shaft on that property.

Mining Investor: At the Portland there are 400 men on the payroll. The output is 5000 tons per month with a value of $250,000.——The Lexington Co. have completed a 110-ton shipment of $50 ore from its Clara D. mine on Gold hill.——Dr. Bartlett, of the Zenobia on Bull hill, reports twenty-five tons of $80 to $100 ore taken out in extending the drift into the claim from the Garfield-Grouse workings.——The output of the Gold Coin is eighty tons daily of graded ore. Three carloads of sacked mineral that will run from fifty to sixty ounces gold to the ton will be marketed this month.——The Strong mine is shipping fifty tons of high-grade ore daily. Sinking is in progress and the shaft is nearing the 800 level.——Lessees on the Monument, on Battle mountain, are saving rich ore. Campbell & Kady, on the south end of the claim, are drifting and have 8 inches of ore which assays $600 a ton, and 18 inches assaying $40 a ton.——At the Orphan Boy G. M. Co.'s Spurgeon & Cassidy lease, shipping ore is coming from the third level, where 4 feet of ore is exposed.——Connection has been made between the workings of the Doctor and Jack Pot. The connection, while furnishing good air for the Doctor lessees, has been the means of starting litigation between the two owners. Work has been resumed in the Doctor, with a production of high-grade ore.

Victor *Record*: The Vindicator Con. G. M. Co. have bought of S. Strong the Anna J. property, in the Legal Tender group, above Goldfield, for $120,000. An adverse bill is pending between the Anna J. and the Pinkerton, Harrison and the Protopean, all of the Golden Cycle Co.——An eighteen months lease has been granted to O. W. Jackson by the Gladys A. M. Co. on the None Such, located on the southwest spur of Gold hill. A royalty of 25% is provided for and sixty shifts per month are to be put in.——Giles and others, sub-leasing on the main workings of the E. Porter Gold King, on Gold hill, are stoping 3 feet of ore. The values are saved in two grades. A narrow streak in the middle of the vein runs as high as $2000 to the ton. The rest of the ore is of smelting grade.

Colorado Springs *Telegraph*: T. A. Rickard, consulting engineer of Stratton's Independence, Ltd., states that the work done by the company since May 1st has been principally in the way of widening the ore chutes, and in every instance it has been found that they have found a greater body of ore than was previously known to exist. The ore bodies found in the fourth level since the company assumed control of the property assure the payment of the dividends for the year at the rate of the last dividend of 10% of the capital stock for the quarter.

Investor: Supt. May of the Alert M. Co. sent a 100-ton shipment to a Pueblo smelter recently. The new shaft on the property is down 75 feet, and bunches of ore are encountered.——Lessee May of the Climax, of the Little Puck Co., on Squaw mountain, reports his last shipment of eighteen tons, worth 3.74 ounces gold and 1 ounce silver to the ton. The working force at the mine has been increased.——Lessees Hutchings, Ranson and Roberts have finished unwatering the shaft on the New Hope, on Carbonate hill. In the 100-foot level there are 18 inches of ore that assays from $12 to $56 per ton.——Mgr. Waldron of the Last Dollar has made a shipment of eleven carloads, one of which was of high-grade smelting ore.——Shipments aggregating 150 tons were sent out recently by Carlson & Boyd from their respective blocks on Work territory. The Carlson lease on the Gold hill end of the Morning Glory shipped 100 tons of graded ore, and the Boyd lease, on the Raven hill side, fifty tons of three-ounce ore.

Mining Record: The output of the Gold Coin is eighty tons daily of graded ore. Three carloads of sacked mineral that will run from fifty to sixty ounces gold to the ton will also be marketed this month.——A carload shipment from the Snow sub-lease on Block 4 of the Lonaconing of the Kimberly was settled for on a basis of $50 a ton. Milliken & Brownlee, the original lessees on this block, have

arranged for a steam hoist on these workings, which they will operate themselves. Other lessees on Kimberly ground are getting out shipments.——The Strong mine is shipping fifty tons daily, all of smelting grade. Sinking is still in progress and the shaft is nearing the 800 level.——Lessees on the Monument, on Battle mountain, are saving rich ore. Campbell & Kady, on the south end of the claim, are drifting at 60 feet. They have 8 inches of ore which assays $600 a ton and 18 inches assaying $40 a ton. On the adjoining block Brodie and associates have also made a small shipment from the extension of the same vein. The lessees are sinking for another drift and have 3 feet of good ore in the bottom of the shaft.——W. G. Newman, Gen. Mgr. of the Lasca Co., has cut a fine-looking lead at surface on the Lasca claim, adjoining the May-Be-So on Globe hill.

IDAHO.

BLAINE COUNTY.

Hailey *Times*: The Minnie Moore mine is to be reopened. The Minnie Moore formerly gave employment to 300 miners and nearly 100 persons in other occupations. It yielded between $5,000,000 and $7,000,000 worth of ore. The new owners, who are capitalists of Spokane, Wash., and Montreal, Canada, have ordered an $8000 hoist and intend to use the Queen of the Hills mill, which they own.

LATAH COUNTY.

For several weeks there have been reports of rich discoveries of gold ore in the Hoodoo country, in the northeastern part of this county. The new quartz discoveries are near the Mountain Gulf stream, which empties into the Palouse, and many claims are being prospected.

NEZ PERCES COUNTY.

Lewiston *Tribune*: J. H. Robinson reports the discovery of tin ore in the region between the Lo Lo and Musselshell, twelve miles from the Clearwater. The discovery was made by Mr. Robinson and L. Woodruf of Asotin and two locations made. One of the ledges is 10 feet wide on the surface and the other, which is less heavily mineralized, is 12 feet. Assays show 10.6% tin. Stream tin was found in this locality some months since by the United States Geological Survey party under W. Lindgren.

SHOSHONE COUNTY.

The copper belt which crosses the country south of Mullan is attracting attention locally. It has been shown that there are a number of veins running through there which carry ore assaying well in gold and copper on the surface. The Springfield has more work done than any other. A crosscut tunnel is nearly to the ledge, which it will cut several hundred feet from the surface. The Park Gold & Copper M. Co. commenced work recently in the same neighborhood and are running a tunnel on the ledge, which has shown ore all the way. Ore from these properties runs from 15% to 35% copper, with gold.

MISSOURI.

The Missouri State Mine Inspector, in his thirteenth annual report on the lead and zinc industry of Missouri, shows that the increase during the fiscal year closing June 30, '99, over that closing June 30, '98, was, in money value, $3,071,574. The production by counties was as follows:

Counties.	*1899.*	*1898.*
Barry	$ 4,900	$ 1,876
Christian	287	3,465
Cole	3,062	....
Franklin	7,619	....
Greene	....	35,650
Howell	3,750	....
Jasper	5,527,412	3,085,795
Jefferson	25,824	26,374
Lawrence	769,972	382,815
Madison	146,285	122,944
Morgan	6,416	....
Newton	400,625	224,589
Pettis	12,000	10,319
St. Francois	2,041,060	2,002,192
Taney	80	....
Washington	60,661	60,101
Wright	....	1,290
Totals	$9,009,953	$5,938,379

JASPER COUNTY.

A combination known as the National Lead, Zinc & Spelter Co., with a capitalization of $10,000,000, with a surplus of $500,000, to control and work large interests in the Joplin-Galena district, has been formed. The concern was promoted by Marcus Pollasky, president of the National Mine Co. of Kansas City. The concern will operate and develop properties in the district and lead and zinc stocks will be listed on the stock exchanges of New York, Boston and Chicago. Mr. Pollasky has for months been taking properties in the Joplin-Galena district. The Joplin-Galena district produces seven-eighths of the zinc ore of the United States and fourth of the world's supply. This field, twenty by sixty miles, will this year produce $16,000,000 worth of ore.

With the resumption of zinc mining in Joplin district, the price of jack remains where it was before the shut-down—that is, at $43 per ton for 60% ore. The surplus has been almost entirely cleaned up, the smelters having paid at some times during the shut-down 50 cents more than the fixed price, very few lots of standard grade ore having been sold for less than $43. At the last meeting of the Miners' Association the directors reported that over 90% of all the mines in the district were shut down. The matter of erecting smelters to act in harmony with the interests of producers is said to be assuming more tangible shape.

NEVADA.

ESMERALDA COUNTY.

Walker Lake *Bulletin*: The Vulcan M. & S. Co. has purchased from J. Fagin and partners their interests in Santa Fe mining district, including the Parrot group, lying five miles east of Lunning. It consists of several claims, notably the Kersarge, Parrot and Dewey. The Parrot shows a body of ore 60 feet in width which by surface cuts and outcrops can be traced 700 feet. The formation is limestone. Forty men are employed in and around the mine, and they have 4000 tons of ore which, from shipments to Selby and to Salt Lake, shows a value of 10% copper, two and one-half ounces silver and $1.80 gold per ton.

LINCOLN COUNTY.

De Lamar *Lode*: F. N. Millett has at Stateline large samples of quartz, hanging together with wire silver. There were blotches of horn silver as large as a dime.——Mr. McIntire of Denver recently took an option on the Aggie D at Stateline, which now has a fine showing on the 100-foot level.— The concentrator being erected by W. A. Clark, on the Ophir Hill Con., bought by him during the season for $75,000, will soon be completed. The plant will have a daily capacity of 100 tons.

STOREY COUNTY.

Elevator No. 2 in the C. & C. shaft during the twenty-four hours ending Friday morning lowered the water 119 feet and 3 inches below the 1950-foot level, which is 2 feet and 7 inches above the lowest point reached before a halt was made to test Elevator No. 1. The latest official telegram is as follows:

VIRGINIA, NEV., Nov. 2, 1899.

To Aug. Waterman, Secretary Comstock Pumping Ass'n., San Francisco: At 6:30 this morning the water was 119 feet 3 inches below the 1950-foot level station. No. 2 elevator has been running continuously. JOS. R. RYAN.

NEW MEXICO.

BERNALILLO COUNTY.

J. A. Coram and associates have secured the Lone Star group of mines near the town of Bland. The company, which has been named the Navajo G. M. Co., has been capitalized for $2,000,000. The Lone Star group consists of twenty-one claims and mines, including water rights, timber lands, mill sites, etc., making over 400 acres of mineral land. This property has been developed for six years, and the ore has been milled in a small mill for the purpose of demonstrating the methods of treating.

OREGON.

Sumpter *American*: Men are at work at the May Queen, constructing the frame of the new quartz mill. Pres. Thomsen and Gen. Mgr. Barrett are giving their personal attention to the new improvements. The mortars and mill machinery are from the Risdon Iron Works at San Francisco. C. H. Godfrey, of Omaha, has been engaged as chief engineer and is at the mine. The mill will be increased to twenty stamps when water can be obtained.——The Virginia group at Robinsonville was worked in a primitive way ten years ago by J. H. Mitchell, of San Francisco, who still owns them. He took out $20,000, it is said, in mortars. The amount, it is claimed, was secured by going down less than 40 feet. The richest finds were on the Virginia proper. Since that time an incline shaft has been put down 125 feet. This filled with water and for a long time the property remained idle. Not long since Mr. Mitchell bonded the four claims to McComas & Dunphey, who took out the water. This shaft had gone on the vein for 95 feet, and the ledge was found to be 2 feet wide, containing both free gold and sulphurets.——Hayes & Gilbert, who are among the principal owners of the Bonanza mine, in connection with Mr. Garthing, have men at work on the Butcher Boy and Blue Bird claims, a few miles south of Red Boy. The men are driving a tunnel to cut the Blue Bird vein. ——Snow & Hamilton have bought one-third interest in the Yellow Daisy group from S. B. Dourty. They are driving a tunnel, now in 150 feet. These claims are one mile east of the Red Boy.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Deadwood *Pioneer-Times*: At the Grantz mine, near Poorman gulch, are found masses of gold in layers about ¼ to ½ inch in thickness and as large as a boy's hand, lying upon an iron ore in a crevice and free from the surrounding rock. They will weigh from one-half to three-fourths of a pound apiece. Mr. Grantz has several hundred dollars' worth of these, found in slabs between the layers of rock. The rich ore which was at first found continues to hold out as at first, and any rock broken from the body shows free gold, some being fine but thickly distributed in the rock, while other pieces contain large nuggets of gold. The slabs taken out are gold and silver combined, estimated to be about one-third silver and the balance gold.

UTAH.

JUAB COUNTY.

At the Silver Park, Silver City, a new body of high-grade lead-silver ore has been found.

IRON COUNTY.

The Popkees mill has been bought by the owners of the Johnny at Stateline. They will rehabilitate the mill and the milling of Johnny ores will begin. F. Wilson, who recently purchased an interest in the Johnny, says the milling ores thus far exposed show a valuation of $30 per ton. The stamps will probably be followed by a cyanide treatment.

TOOELE COUNTY.

In the Bunker Hill at Stockton the management has broken into the main ore shoot in the drift off the 200-foot level, which affords 70 feet of stoping ground.

Salt Lake *Tribune*: A deal by which the Midas group of gold claims in the Deep Creek country pass to J. Dern and J. Chipman of Salt Lake has been consummated. The Midas is a gold proposition, located near Clifton. Orders have been given for the erection of a cyanide plant with a capacity of 150 tons per day. They have blocked out ores of the value of $100,000. Careful sampling shows an average of $20 per ton in gold. The Midas G. M. Co. has been organized to operate the property. In deciding upon what process to employ, experiments were made at the Mercur Co.'s mill at Manning and the MacArthur-Forrest plant at Denver, the result of cyanide being satisfactory.——The Geyser-Marion mill is running on a better quality of ore than has been put through it during the year, while a greatly improved saving is reported.——At the Mercur the air compressor is idle, also the power drills, but 400 tons of ore are going daily to the mill and about 130 tons are being put through the tailings plant.

WASHINGTON.

(Special Correspondence).—J. F. Lansing is in Republic preparing for the erection of a custom mill to handle Republic ores. He is understood to represent Montanans. He says the mill will be in operation next March. The boilers and dynamo for the electric light plant are now at Grand Forks on the way to be installed here.

Republic, Oct. 24th, '99.

FERRY COUNTY.

(Special Correspondence). — The Princess Maude will install a compressor plant Nov. 1st.

The Mountain Lion's new cyanide mill is nearing completion. The 125 H. P. engine that will drive the electric generator is on the ground; the battery blocks are in position and the machinery is expected daily. The completion of this plant will mark a new era in Republic's prosperity.

The Tom Thumb people contemplate putting up a steam hoist.

Another rich strike in Tunnel No. 4 of the Republic mine is announced. This tunnel is in 2330 feet and leads directly from the reduction works to the ore body. It cuts the ledge 600 feet underground—the deepest workings in the camp. The ore in the new strike is mixed with dark patches of tellurium. With the exception of a small amount of tellurium found in the Morning Glory and Princess Maude, this is the only tellurium found in the camp. The management give out the information that the ore body is 27 feet wide, of which 7 feet will run $200. It is also stated that the capacity of the present reduction works will be enlarged as the result of the new strike.

The shaft on the Hit or Miss is down 100 feet and a whim will soon be in operation.

It is estimated that 1500 prospectors are at work in Republic and tributary camps.

Republic, Oct. 27th, '99.

Spokesman-Review: The Republic continues to produce large amounts of high-grade ore, and early reports of the late strike have been confirmed by development. There is a body of ore that assays $450 in the stope on No. 3 level. The ore body is 27 feet wide in the lowest workings.——The hoist for the Butte & Boston is on the ground and will be used on the old shaft which will be sunk several hundred feet before any other work is done on the mine. The ledge is the same as the Princess Maud. There is a 40-foot shaft, a 40-foot tunnel and over 300 feet of drift along the ledge. A second tunnel has cut the ledge at a depth of 250 feet. This tunnel is 400 feet in length.

KING COUNTY.

Since January 1st the Seattle Assay Office has received for treatment $11,611,204, and since the office began business, July 15th, '98, $17,280,361.

SKAGIT COUNTY.

Seattle *Times*: The Thompson-Edgar properties near Baker on Thunder creek are being worked. They are putting in pumping machinery. The ore, a copper-gold-bearing sulphuret, shows up well and a deep shaft and tunnel will be driven into the body this winter. —— McGinnis & Morovitz are driving their tunnel on Swift creek. They are working free milling quartz. This property is to be sold to Whatcom properties, who will build a stamp mill.——Dr. Casselmann and partners are shipping molybdenum ore, some of which is almost pure. The mines show two ores of high grade, one a foliated molybdenite of high grade, the other a yellow mineral, the oxide of molybdenum. These mines, seven in number, will be worked all winter and ore shipped.

STEVENS COUNTY.

The Deer Trail No. 2 M. Co. is now in undisputed possession of property in Cedar canyon, comprising an area of 700 acres, the litigation which has threatened on account of the ownership of some minority holdings in the Elephant group, adjoining the Deer Trail No. 2, having been settled. The Deer Trail No. 2 Co. becomes the owner of four-sevenths of the Elephant group. The mine is showing up better ore than before, in the drift which is running from the Deer Trail No. 2 claim into the lately acquired section of railroad land. Late smelter returns on Deer Trail shipments have run $200 per ton.

FOREIGN.

BRITISH COLUMBIA.

The yardmen and samplers at the Trail smelter on the 28th ult. demanded an increase in wages. A compromise was effected on the basis of the Northport smelter schedule. Yardmen will get 20 cents per hour and samplers 27½ cents.

The strike in the Slocan country is critical and the Silver & Lead Mine Owners' Association is importing Italian laborers from Pacific coast States, the first consignment having arrived at the Payne mine. The striking miners are excited over the arrival, but no violence was offered to the Italians when they appeared. The trouble between the mine owners and the mine workers is upon the adoption of the eight-hour law. Mine owners reduced wages from $3.50 to $3 per day, the miners refusing to accept the reduction.

The stope opened in the Center Star mine at Rossland, a year ago, supposed at that time to be 8 feet wide, has been proven, it is reported, to be from 16 to 30 feet wide.

At the 750 level in the Le Roi the workings have disclosed the richest chute of ore in the camp. It is 5 feet wide and has been opened for 30 feet. Values range from $50 to $90 per ton. The chute in the 250 level has proved to contain an unexpected seam of $30 ore, 5 feet wide and 100 feet long.

A rich strike is reported in the Ward gravel mine at Cariboo, in which San Francisco, Cal., people are interested.

Grand Forks *Miner*: A number of mines in the Slocan district recently closed down owing to the demand of miners for better pay. Similar trouble is threatening in the Kootenay and Boundary districts. A struggle between the miners and mine owners in the Kootenays, including the Boundary country, is pending. The miners are dissatisfied with the Rossland scale of wages and have demanded practically an increase of 50 cents a day for all classes of mining labor. They also want the eight-hour law enforced. The Rossland miners have taken the lead in the latest move.——H. Sutherland, managing director of the Dominion Copper Co. operating in Greenwood camp, and a member of the British Columbia Mine Owners' Association, stated that the impression that the Rossland miners have given in completely on this question is erroneous. In conjunction with their fellow-members in other sections, they have demanded an all-round increase of 50 cents per day for eight hours' work. The mine owners have received an ultimatum. They have determined to grant no further concessions, and, rather than submit, all the mines, including the Le Roi and War Eagle, will close down. The Rossland scale paid in all the Boundary mines, with one exception, is as follows: Power drill men, $3.50 per day; hammer men, $3; timber men, $3; muckers, $2.50. Fifty cents is added to this scale for shaft work.

MEXICO.

Nearly $20,000 worth of silver ores have been reduced to bullion in the Guadalupe reduction works since their beginning in 1883.

Mexican Herald: Modern processes are not a failure in treating Mexican ores. The new 20-stamp mill put in recently at Guanajuato by the Guanajuato M. & M. Co., it is reported, show a saving of 90%, and the plant will be increased to eighty stamps.

Recently Declared Mining Dividends.

Victor M. Co., Colorado, $50,750; Oct. 20.

Raven G. M. Co., Colorado, $10,000; payable Nov. 20.

Standard Con. G. M. Co., Bodie, Cal., 10 cents per share; payable Nov. 22.

Anaconda C. M. Co., Montana, $3; Nov. 1.

Boston & Little Circle Zinc Co., $1 per share; payable Nov. 10.

Boston & Montana, $15 per share; payable Nov. 20.

Homestake G. M. Co., South Dakota, 50 cents per share, $105,000; Oct. 25.

Montana Ore Purchasing Co., $1 per share; Oct. 27.

Rio Tinto Copper M. Co., Spain, 35s per share.

Alaska-Treadwell, quarterly, 37½ cents per share; Oct. 28.

Le Roi M. Co., British Columbia, $25,000; payable Nov. 7.

Commonwealth Zinc Co., Nevada, $10,000; Nov. 1.

Grafton M. Co., Colorado, $10,000; Nov. 1.

Last Dollar M. Co., Colorado, $20,000; Nov. 1.

Mary McKinney, Colorado, $30,000; Nov. 1.

Moon-Anchor M. Co., Colorado, $45,000; Nov. 1.

Petro M. Co , Utah, $5000; Oct. 31. Total, $32,500.

Swansea, Utah, $5000; payable Nov. 10.

Bunker Hill & Sullivan M. & C. Co., Idaho, $21,000; payable Nov. 4.

Commercial Paragraphs.

SCHAW, INGRAM, BATCHER & CO. of Sacramento, Cal., are sending large quantities of pipe for hydraulic mining into Trinity Co., Cal.

THE Vulcan Iron Works of San Francisco have the contract for furnishing and erecting a hydraulic hoist for slip No. 7, San Francisco harbor.

IN the past five months the Colorado Iron Works Co., of Denver, Colo., have built and installed fourteen smelter blast furnaces in the U. S. and Mexico.

ON the 1st inst., Newton M. Bell, representing the Trenton Iron Co. of Trenton, N. J., removed his offices from 109 California St. to 308 Market St., San Francisco.

S. W. TRAYLOR, representing the Colorado Iron Works Co. of Denver, Colo., has finished putting in the reduction works for the Black Warrior Copper Co. at Globe, Arizona.

THE Denver Engineering Works Co., of Denver, Colo., have shipped a complete pyritic smelter plant to Dahlonega, Georgia, the first shipment of the kind ever made to that State from Colorado.

TWENTY-FOUR traction engines and fifty trucks are being sent to South Africa. The Daniel Best Mfg. Co., San Leandro, Cal., report large demand for their locomobile freighting trains throughout western America.

Books Received.

"*The Building and Ornamental Stones of Wisconsin.*" Bulletin No. IV, Economic Series, Wisconsin Geological and Natural History Survey. Treats on the building and other stones found within the State of Wisconsin, their uses, etc.; 544 pages; illustrated. Published by the State.

"*Transactions of the American Institute of Mining Engineers,*" Vol. XXVIII; 948 pages; February, 1898, to October, 1898, inclusive. Published by the Institute, New York. Illustrated.

Industrial Notes.

—The Floriston, Cal., paper mill wants a daily carload of lime.

—The telegraph rate from Atlin to Dawson is $4 for ten words or less.

—A new railroad is projected between Ensenada, Lower California, and San Diego, Cal.

—The Snoqualmie Falls, Wash., Electric Co. has begun to supply Seattle with light and power.

—Nearly $250,000 has been invested in new pumping plants in the vicinity of Pomona, Cal., this year.

—Over 1100 men are closing the gap on the California coast line railroad between Surf and Elwood, Cal.

—The Truckee River, Cal., General Electric Co. expects to be ready to deliver power on the Comstock June 1st, 1900.

—The hydraulic system put in by the Risdon Iron Works of San Francisco is draining the entire Comstock from end to end.

—All the holdings of the Mount Nebo Land & Irrigation Co. in Juab county, Utah, have been sold to Eastern investors for $600,000 cash.

—For the first ten months of '99 the United States has furnished Mexico with $338,335 worth of electrical material, about double the sales of the same period of '98.

—Great Northern trainmen say they will refuse to sign bonds, and if the company deducts cost of same from their October pay checks they will go out in a body.

—The annual report of Commissioner Hermann of the General Land Office, shows a total of 929,308,068 acres of unappropriated and reserved public lands in the United States.

—The Butte County, Cal., Electric Power & Lighting Co. begins operation next week. Power is to be used by manufacturers, dredgers, farms and mines. The plant adds 5000 H. P. to the 8000 H. P. brought from Folsom, Cal.

—Exchange of money order business between the United States and Mexico will take effect Jan. 1, 1900, when money orders may be drawn in Mexico on all points in the two countries, payable at all money order offices in Mexico.

—P. L. Shuman of San Andreas proposes to build a canal nine miles to bring water from the Mokelumne river to Mokelumne Hill, Cal., with fall sufficient to drive an electric plant. The power is the used on the Boston and other Mokelumne Hill mines.

—The Blue Lakes Water Co.'s power plant at Blue Lakes, Cal., was destroyed by fire on the 1st inst., involving a loss of $30,000 and cessation of operations in mines, factories, etc., supplied thereby. A new and enlarged plant will be installed at an improved adjacent site.

—Scarcity of iron causes singular trade conditions in San Francisco. Old mining camps have been scoured for old iron; machinery, once costing large sums, dismantled and shipped to the bay; Cuban cannon balls have been imported; iron is on the way from Scotland; and pig iron, once sold and shipped to Japan, is now being returned to California, costing, laid down, $17 per ton.

—The transcontinental railroads, together with their connecting transpacific steamer connections at San Diego, San Francisco, Portland, Tacoma, Seattle and Vancouver, have just issued a new tariff, advancing freight rates 25%. Cotton alone, which is shipped in large quantities from Texas to Japan, is exempted from this increase. An advance of rates by the way of the Suez canal is given as a reason for the increase by way of the Pacific ports.

—Tampico, Mexico, wants bids for the construction of an aqueduct to supply 8000 liters water per minute for public and domestic uses, and also for a complete system of sewerage for the purifying and cleansing of the town, in which latter shall be included the work of paving the streets. The water is to be taken from the river Tamesi, twenty kilometers from the town, and will require about 10,000 meters of distributing pipe.

—The American consul at Berlin writes that vexatious postal and tariff charges on mail matter between the United States and Germany have been abrogated, and that henceforth it will be possible for shippers in both countries to send, prepaid, postal packages not exceeding five kilograms (ten and one-half pounds) in weight with absolute certainty that they will be delivered without any other charge than import duty, which can be accurately calculated, all German duties being specific.

—Improvements costing almost $8,000,000 have been agreed upon by the board of managers of the Carnegie Steel Company, of Pittsburg, to include the erection at Rankin of two blast furnaces, each with a capacity of 700 tons of pig iron per day, a double-track steel bridge across the Monongahela river to connect the Rankin furnaces and the Homestead works, a new open-hearth plant and a reversible blooming mill at Duquesne. The two new blast furnaces will be the largest in the world, and will give employment to 5000 additional men.

—The Canal Commission in Nicaragua is straightening the proposed route and otherwise lessening the cost of constructing the waterway. It is estimated that the Commission will decrease by several million dollars the amount mentioned by Admiral Walker in his recent report to Congress. Capt. A. P. Davis of the Commission has charge of the hydrographic division which is to examine the five proposed routes across the Central American isthmus and report the result of their investigations to the Government of the United States. Capt. Davis has under his command a number of engineers who are taking the measurement of streams of water that flow into the lakes along the course of the projected canal. He reports that there is plenty of water for canal purposes in Nicaragua.

—The Philippine Trading Association is trying to do business with the islands. It recently shipped one and one-half barrels flour, in packages, to Manila, to introduce it. These are the charges the Government collected on the flour at Manila:

Specific duty, 129 kilos, at $3.10 per 100 kilos	$2 71
Consumer's tax, ½-cent per kilo	65
Ad valorem duty, 8% of $7.25	58
Surtax, 10% of specific duty	27

The total duty collected was $4.21 Mexican, or $2.10 American money. A milling company has received returns on a shipment of 500 barrels of flour made to Manila last June. Freight from Portland to Hong Kong was $5 a ton, gold; from Hong Kong to Manila $3.50 a ton, gold, and lightering charges at Manila $2.50 a ton, gold. Total freight charges were $11 a ton, or $1.10 a barrel. By the time a barrel of flour was landed at Manila it was worth:

Cost price at Portland	$3 00
Freight charges	1 10
Specific duty	1 00
Surtax	10
Consumer's tax	25
Ad valorem duty	24
Lightering at Manila	25
Total	$5 94

Flour at $5 94, gold, or $11.88 Mexican, is an expensive luxury for Filipinos.

Personal.

GILL S. PEYTON has returned from Boston to Salt Lake City.

E. L. BALLOU has returned from Pony, Montana, to Igo, Cal.

SAMUEL NEWHOUSE has returned to Salt Lake City from Europe.

C. M. COE is the venturesome projector of a newspaper at Cape Nome, Alaska.

J. A. AMES, a Utah mine promoter, is examining property in northern California.

L. C. TRENT has returned to Salt Lake City, Utah, from a business visit to California.

BERTRAM HUNT expects to return to San Francisco from Australia about Jan. 1, 1900.

C. B. WINGATE of Plumas Co., Cal., has gone to Scotland in his company's interests.

W. S. EDWARDS, formerly Gen. Mgr. Silver King, Ltd., M. Co. of London, is in New York City.

D. C. JACKLING of Salt Lake City, Utah, is cyanide experimenting on ores of Republic, Wash.

MESSRS. DONAHUE AND JENNINGS of Utah left San Francisco on the 28th ult. for Sinaloa, Mexico.

R. U. GOODE of the U. S. Geological Survey is superintending topographic work at Bingham, Utah.

H. P. GORDON of Oakland, Cal., has returned from Alaska and will winter in Amador county, Cal.

ROY D. HUNTER, Colorado Agt. Sullivan Machinery Co., has returned to Denver from Salt Lake City, Utah.

EMIL MELZER is Supt. North Pole mine, seven miles from Sumpter, Or., the deepest mine in that State.

W. W. BOSWELL of Julian, Cal., has gone to Darwin, Inyo county, Cal., to assume charge of the Darwin mine.

H. G. MURRY, late Supt. Lightner, Cal., mine, has gone to Korea in the employ of an Oriental mining corporation.

C. E. WATSON, of Carson, has been appointed Supt. of the Almono M. Co., in Antelope valley, Mono county, Cal.

ISAAC TRUMBO says he will put in a 1000-ton cyanide plant on the Free Gold Co.'s property, Hedges, San Diego county, Cal.

PROF. W. L. WATTS has returned to San Francisco, Cal., from a visit of several weeks in the Los Angeles, Cal., oil field.

PRES'T W. H. EDGAR of the Dearborn Drug & Chemical Works, Chicago, has returned from a business visit to Honolulu.

E. H. BENJAMIN, Sec'y California Miners' Association, leaves San Francisco, Cal., on a two months' trip to Port Dick, Alaska.

M. L. REQUA of Oakland, Cal., is in Arizona, investigating the mineral veins of Stockton Hill region, in company with M. D. Rochford.

ROBT. J. LONG, assistant manager of the Hidalgo M. Co. of Parral, Mexico, has returned to the mine from an extended Eastern trip.

PROF. S. F. EMMONS of the U. S. Geological Survey, reports that on Oct. 28th he proposed climbing Popocatepetl, Mexico's biggest volcano, and then determine its altitude.

H. E. RAYMOND, representing the General Electric Co., is at Charlotte Plains, Australia, supervising the erection of an electrical plant for the Deep Leads Electrical Transmission Co.

EDWARD KANE, who has been superintending the Ford mine at San Andreas, Cal., will take charge of the Oro Fino mine in Big canyon, El Dorado Co., Cal., owned by Hayward & Lane.

ALEX. TARBET, W. G. BENHAM AND A. J. SCHUMACHER of Utah and Montana are examining the Afterthought, Shasta county, Cal., to determine whether they will pay $150,000 for that property.

VICTOR M. CLEMENT of Oakland, Cal., one of the sixty "Uitlanders" who paid a fine of $10,000 each four years ago in Johannesburg, South Africa, and who was a prominent mine manager there for three years, thinks that after the British have subjugated the Boers the Transvaal Republic will not be destroyed, but that the Uitlanders will be given a vote and special privileges abolished.

HENRY GAGER proposes to build a custom smelter to treat ores by the Loder pyritic system at Grand Forks, B. C. Associated with him are J. MacDonough and E. T. Bradford, Pres. and Gen. Mgr. of the Southern Smelting Co. of Denver, Colo.

C. K. BANNISTER has been appointed consulting engineer of electric power and irrigation plant to be built at Payette, Idaho, on the Payette river, to have a capacity of 6000 H. P., to operate a street railway and to light the towns and mines within a radius of forty miles.

ANDREW JOHNSON, Gen. Supt. Deadwood-Bear Gulch M. Co., thirty miles southwest of Deadwood, South Dakota, says he has found tin ore in large quantities in the Bear Gulch district. According to him the tin-bearing veins run from 2 to 18 feet in width and carry values in tin from 1% to 6%. He claims that there is also a great quantity of stream tin, or cassiterite, about 72% pure tin. He says this stream tin is found in the gravel and gold placer miners save it. "Many of the miners have saved from six to a dozen tons, and have it sacked up in their cabins."

A. C. HINKSON of Sacramento, Cal., says that Major Heuer, who is at the head of Government engineering work on the coast, has reported to a sub-committee of the Committee on Dams of the California State Miners' Association that the Government Debris Commission had been engaged the past eighteen months in making investigations and surveys for a site for a dam to restrain the debris in the Yuba river, that it had finally located a site for such works and that Major Heuer had told the committee that the plan was entirely feasible and that, with the appropriation of the $500,000 which is available for such purposes, works can be constructed with sufficient capacity to take care of all the debris which is now deposited above the proposed works, and also all of that to be carried down from the hydraulic mines during the next twenty years, and that the works can be enlarged as necessity may require.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT DRYING TRAYS.—S. H. Chase, San Jose, Cal. No. 635,423. Dated Oct. 24, 1899. The object of this invention is to provide improvements in trays which are designed for drying fruit by exposure to the sun and atmosphere. The tray consists of sides and ends, the ends having less depth than the sides and bottom slats nailed longitudinally to the end pieces having open spaces between the slats, and a thickness equal to the difference in depth between the side and end pieces of the tray so that the bottom of the slats are flush with the lower edges of the side strips. Transverse bars are nailed across the bottom and sides at intervals, and strips of less thickness beneath the end of the trays. Side strips are nailed to the bottom of the cross bars in line beneath the side rails of the tray, and these strips curve upwardly at each end where they are nailed. Blocks are nailed upon the sides of the tray having the upper and lower ends beveled in such a way that when one tray is piled upon another these beveled ends prevent the trays sliding out of place. By the curvature of the supports for the trays the trays themselves are raised from the ground so that there is a free circulation beneath them, and when the trays are piled or nested together they are in the same manner separated to allow the air to circulate.

CAR FENDER.—Wm. Morck, Oakland, Cal. No. 635,445. Dated Oct. 24, 1899. This invention is designed to provide a fender extending from the front of cars and like vehicles, to prevent persons from being injured by passing under the wheels. The guard comprises forwardly projected inelastic curved arms having their rear ends hinged to a permanent part of the car structure. Vertical arms are fixed to the guard and rods slidable through the support to which the guard is hinged above and below the hinge point. Spiral springs surround the rods, the lower one in front of the support and the upper one in rear of it, so that whenever the fender strikes anything the two springs will yield their opposite sides. The fender is normally carried a slight distance above the surface over which it is passing, but will be forced down by a weight falling upon it, the springs yielding for that purpose and returning it to its normal position as soon as the weight is removed.

DISCHARGE GATES FOR TANKS.—C. W. Merrill, Alameda, Cal. No. 635,442. Dated Oct. 24, 1899. This invention is designed to provide a discharge gate for that class of vats or tanks of large diameter which are used in the treatment of valuable precious metals by what is known as the cyanide process or similar processes in which the pulverized ores are subjected to solutions for the purpose of removing the precious metal. The tanks have one or more openings in the bottom, and in my invention I employ vertically movable hollow conical gates having packing rings fitted in the bottom, and these are closable upon annular seats around the periphery of the opening. The interior of the gates have convergent guides which, first entering the openings, serve to guide and center the gates so that they will close accurately upon their seats. The gates are movable by means of screw shanks extending upwardly and turnable in suitable nuts above. The screw shank is fixed in the gate stem by keys which project and are slidable in vertically slotted exterior tubes so as to form gates to prevent the parts from being turned around when moved up or down the screw.

LETTER OPENER.—H. Markham, San Rafael, Cal., assignor of one-half to W. I. Thayer of same place. No. 635,495. Dated Oct. 24, 1899. The object of this invention is to provide a convenient device for rapidly opening letters which is particularly desirable where there is a large mail to be handled. It comprises a fixed base, an inverted blade fixed to the base having a cutting edge presented downwardly and tapered to a rounded point. In conjunction with this is an elastic guide adjacent to the point of the cutter, and a depression beneath the blade through which the part to be cut is moved. The blade is provided with a screw by which it may be adjusted and upon the side of the blade is a spring which presses the fold to be cut against the blade so that the latter passes through the fold and slits it open.

WATER LIFTING APPARATUS.—P. S. Nowacki, San Francisco, Cal. No. 635,504. Dated Oct. 24, 1899. This invention comprises a device for lifting water in considerable quantities. It comprises oppositely inclined cylinders, the lower ends of which are submerged within the source of supply, and the upper ends inclining towards each other and made to discharge into a receiving tank or chamber. Within these cylinders are right and left hand spirals respectively, and by means of suitable gear mechanism connected with the shafts of said spirals they are rapidly rotated within their cylinders, thus collecting the water at the bottom and forcing it up to the discharge end at the top. Divergent directing flanges at the upper end serve to deliver the water and prevent its being thrown outwardly as it escapes from the upper end of the cylinder. Wedge-shaped plates extend from the shafts outwardly between the spirals, and these serve as a sort of shake to prevent the water flowing backwardly when the speed of the apparatus may be temporarily checked or reduced.

SLIDABLE SWINGING WINDOW SASH.—B. Hausmann, San Francisco, Cal. No. 635,437. Dated Oct. 24, 1899. This invention relates to that class of windows in which the sashes are vertically slidable for ordinary use, and they are also so connected that they may be opened about hinges independent of the sliding movement. In this invention there are slides having connected with them the cords of the counterweights, and these slides are guided and movable in suitable grooves between the stops and parting beads of the window. The sashes are hinged to these slides so as to open about them, the hinges being peculiarly constructed so that the pintles are exterior to the stops, and the sashes, when opened about the hinges, are carried outwardly so as to be clear of said stops. An automatically operating hook is connected with the hinge so that when the sash is to be opened this hook engages with a fixed plate or holder in the pulley stile and thus holds the sash above the window seat while it is being opened about its hinges. This is necessary because, after it has been disengaged from the slide upon the opposite side, the single counterweight would not be sufficient to prevent a heavy window sinking down and resting upon the window seat. When the opposite edge of the sash is disengaged from the slide with which it is normally connected it is also necessary to prevent this slide moving up by reason of the connected counterweight, and the slide having been relieved of the weight of the sash, I have therefore shown a locking key which is designed to fit into suitable engaging holes or devices in the pulley stile, so as to retain the slide in place after the sash has been unlatched therefrom. When it has again been closed and latched this key is removed and the act of closing also disengages the hook by which the opposite side of the sash was held and the sash is then in condition to move vertically in its slide.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 24, 1899.

635,642.—GRAIN ROLLER—E. Berg, Woodland, Cal.
635,652.—SMELTING FURNACE—J. H. Canavan, Kirkland, Ariz.
635,423.—FRUIT DRYING TRAY—S. H. Chase, San Jose, Cal.
635,713.—RAISIN SEEDER—N. B. Converse, Fresno, Cal.
635,303.—LUBRICANT—F. T. Cook, Antelope, Or.
635,667.—AIR COMPRESSOR—C. Cummings, S. F.
635,372.—OPERATING MECHANISM—W. G. Dodd, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Expected Meteoric Shower.

About the 14th or 15th inst. is expected the appearance that every thirty-three years takes place of millions of "falling stars." In 1800, 1833 and 1866 the phenomena were universally observable, and it is predicted that this year the November display will be unusually spectacular.

Since the first noted flight, in 1833, meteoric astronomy has been studied, and it has been found that the tracks of shooting stars seen on certain dates, when traced backward, point to a particular point of the heavens, or that meteors appear to radiate from a certain point among the stars, situated in the constellation of the Lion, on which account these shooting stars have been called Leonides or Leonids. None who behold the cataclysm of fire which will pour from the sky when the orbit of the Leonids intersects that of the earth will fail to bear forever in mind the memory of the spectacle. Every year a few scattered fragments of the shattered heavenly body are seen, but the appearance of the main groups is relatively rare.

The single meteor or meteorite which makes, when it strikes the atmosphere of the earth, the so-called shooting star is often a mere tramp of the heavens—the detached fragment of some burst planet, too small for observation with the best telescope, wandering in space until it comes within the circle of attraction of some larger body, when gravity causes it to fall. Generally in the course of its descent through the atmosphere of the larger body the meteorite generates so much heat that it is entirely consumed; but, if large enough, a part remains and strikes the earth. But neither the single meteor nor meteorite can be observed except in the brilliant fashion of its death.

The comet, on the contrary, is a creature of the skies more to be reckoned with; for, erratic as its wanderings may seem, in reality it pursues a definite course among the stars. The lengths of the orbit which comets travel vary from a few hundred millions of miles to thousands of billions. The time which different comets take in completing their orbits varies from three and one-half to a hundred thousand years. The preciseness of astronomical knowledge is such that the exact distance of one of these bodies moves in a second can be determined. Hence the time at which it will arrive at any given point in its orbit can be predicted to the second. As the Leonids are but the fragments of a former comet, and as those fragments are following the course pursued in bygone ages by that comet, there is nothing remarkable in the further statement that modern astronomers can predict the time at which the November meteoric showers will appear. The swarms of particles which formed the once glorious orb known as Tempel's comet now pursue in the outer darkness of space the identical path which they followed when parts of a composite whole.

This year the earth will strike the center of the comet, and on the principal night—which will probably be that of November 14th—the meteoric shower is expected to present a scene of beauty. Before midnight there will not be much to reward the watcher.

Reckoned by the figures of the heavens, the Leonids are but infants. According to Prof. Newcomb, Tempel's comet has been dead only 3300 years. The cause of explosion was probably the intense heat generated by the terrific rate at which the comet revolved. But for the fragments of the burning body there could be no rest. The forces which compelled the larger body to follow through countless ages a certain path were at work as well among the flying particles. They fell into line, the larger fragments taking the head of the line and the smaller particles falling in behind for a million miles and more, and the unending journey, interrupted for a while, was taken up again along the old path. The course of Tempel's comet and of its subsequent particles completely encircles the orbit of the earth, touching it only at one point on its outer edge. Continuing, it crosses the orbit of Jupiter and Saturn and extends a few millions of miles beyond that of Uranus. Its orbit is elliptical and twenty times as long as that of the earth.

No one is able to predict the exact hour at which the November meteoric showers will begin. Although these meteoroids revolve around the sun in a definite orbit, the point of that orbit's intersection with the orbit of the earth moves forward at the rate of one and one-half degrees a year, thus throwing the advent of the meteors a few hours later at each succeeding fall. For example, the fall of 1833 occurred on the night of November 13th; the fall of 1899 will take place on the evening of November 14th and probably will be of some hours' duration. It will be visible throughout the whole of the North American continent and in Europe and Asia. The November meteors receive the name of Leonids from the fact that they seem to pour out from that part of the heavens wherein is located the constellation of Leo. In weight these meteors vary from a few grains to many pounds. On striking the earth's atmosphere they begin to burn at the height of seventy-four miles and are generally entirely consumed at a height of fifty miles.

The Arch Principle in Dams.

The application of the arch principle to dams is of comparatively recent date, for though some old structures have curved outlines, convex on the upstream side, they were so made for the sake of appearance and cannot rightfully be called arch dams. The arch dam proper is virtually a masonry arch with which the pressure of the water, impounded on the convex side, takes the place of the load, but the weight of the masonry does not add to the load as in the case of the railway arch. Like the railway arch, however, the load on the arch dam is resolved into a lateral thrust transmitted to the abutments on the banks of the river. It is, however, difficult to determine with any degree of accuracy the magnitude of the reaction at the abutments, as the weight of the masonry and the adherence of the structure to the foundations introduce disturbing influences and a large part of the water thrust is absorbed in overcoming these dissatisfactions.

Considerations of cost limit the use of the arch dam to small spans. A narrow river bed bounded by steep, rocky embankments is especially adapted for this type, and engineers have not been slow to take advantage of such natural inducements in some parts of the world.

In the mountainous regions of California, where many rivers utilized for water power and water supply purposes rush down narrow gorges bounded by precipitous cliffs, the conditions are most favorable for the arch dam, and many of the boldest structures of this kind may be seen in that beautiful country. Perhaps the most famous is the Sweetwater dam, 90 feet in height and 340 feet long, a narrow wall, bending upstream in a graceful curve, the slender outlines of which cause feelings of distrust in the non-technical observer as to its competency to perform the steady and unremitting duty of holding back the waters of the river, for it has been well and truly said that an arch never sleeps, an aphorism which might be applied to arch dams where the water never fails.—Robert S. Ball, Jr., in Cassier's Magazine for November.

ARRANGEMENTS are being made by the Signal Corps of the War Department to conduct elaborate experiments in wireless telegraphy. The experimenting will be conducted under the supervision of Col. Squier, the telegraphic expert of the corps. He will be aided by Mr. Marconi. It is proposed to go to some point along the seashore where the practicable utility of the wireless system may be fully demonstrated.—Electricity.

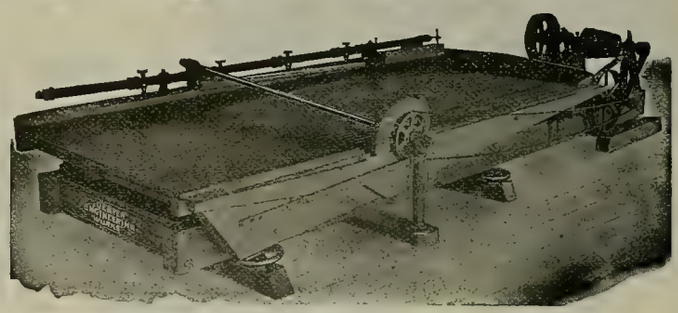
THE RISDON HAMMERED SHOES AND DIES

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

THE RISDON IRON WORKS, SAN FRANCISCO.

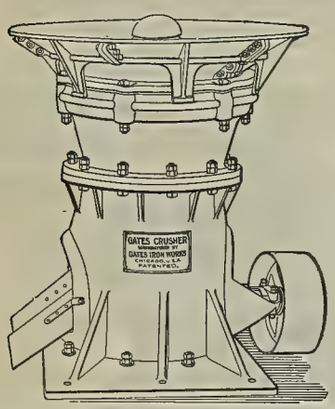


THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : : :



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

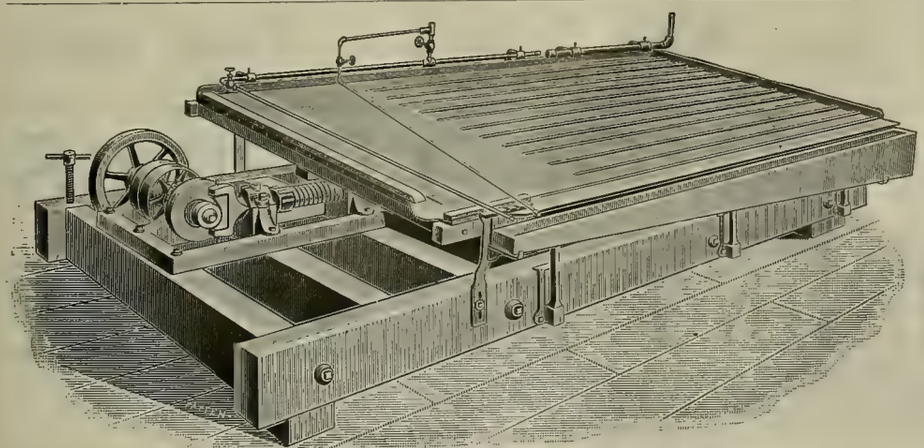
SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,



Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us.

The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestibly superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

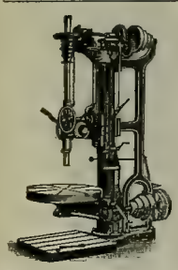
"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ¾-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.



—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

THE
"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

306 BOSTON BUILDING, DENVER, COLO.

Market Reports.

SAN FRANCISCO, Nov. 2, 1899.

SILVER.—London, 26¾d; New York, 58½; San Francisco, 58½; Mexican Dollars, 47½@48½; New York exchange, sight, 12½; telegraphic, 15 cents premium.

LEAD.—New York reports quiet, $4.60 bid, $4.62½ asked; brokers' price, $4.40.

Local, pipe, 7¼@7¼c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6¾c.

COPPER.—New York reports Lake quiet at $17; brokers' price, $17. Local—Mill copper plates, 28¾c.

The copper market seems uncertain and rather weak. The price has slowly declined to 17 cents. With the fall of the market price of the metal comes a decline in the copper shares which had been inflated to a high figure. Consumers continue to postpone purchases. In the absence of trade orders there is no supporting buying from other sources, and the market is left to take its course. In the meantime there is more copper being shipped abroad, and exports so far this month are in the neighborhood of 7500 tons.

IRON.—American, soft, $24@25.50 per ton; Scotch, $27.50 - Local bar, 2¾c per lb

The iron and steel situation is a subject of discussion among consumers of material. A multitude of large enterprises is calling for material, and promoters and manufacturers are at a loss to know what to do. The present upward tendency appears to be strong. Should prices advance further, it would interfere with a good many of the enterprises now in hand.

STEEL.—11¼@20c per pound.

TIN.—$30.60 bid and $30.85 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $50; export, $45@45.50; carload lots, special rates.

Quicksilver has made another decided advance, going from $47 last week to $50 to-day. The London price is £9 5s, and in New York $50 for 100-flask lots and $51 for small lots. The Rothschilds have withdrawn from the American market, and there seems to be almost a famine in quicksilver. Quotations are higher to-day than they have been for several years. The strength of the situation is based upon the shortage of supplies, there being at present less than one month's supply in this country, the approximate number of flasks at present being only 2500, while consumption per month averages between 3000 and 4000.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

PLATINUM.—London, 66s per ounce; New York, $17.75; San Francisco, $17.25.

ZINC.—Dull and easy; $4.85 bid, $5.00 asked.

After a shutdown of 90% of the zinc mines in the Joplin district for two weeks, operations have been resumed. The smelters questioned the price of ore fixed by the Miners' Association, and threatened a shutdown. The Miners' Association took the matter in hand and made the shutdown itself. There is a difference of opinion among the miners as to the wisdom of holding the price at $43 per ton for 60% ore, as this price is based upon 6c per pound for spelter, and there is much justice in the contention of the smelting men that 6c is an extreme price. The smelters say that for from 5c to 5¼c per pound the entire zinc output can be absorbed, but that at 6c per pound the manufacturers use substitutes for zinc. There is no substitute for zinc in either electricity or galvanizing, but there are many places in which other metals can be used as a substitute.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15¼c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5½@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c per 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¾c; 6s, 12 oz., 5¼c; 6s, 10 oz., 5¼c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7¾c; 6s, 10 oz., 6¼c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd.,	14 50	Welsh Anthracite	12 50
Scotch	8 00	Rock Springs	7 60

COKE.—Foreign, $13; domestic, $12 per ton.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.20; less than 200 gals., $1.25; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 56c; cs., 66c; raw, bbl., 54c; cs., 59c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 19c; Astral, 19c; Star, 19c; Eocene, 21c; Extra Star, 23c; Elaine, 24c; Water White, bulk, in tanks, 13c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 47c; cs., 52c; No. 1 bbl., 42½c; cs., 47½c; Neatsfoot Oil, bbl., 55c; cs., 65c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

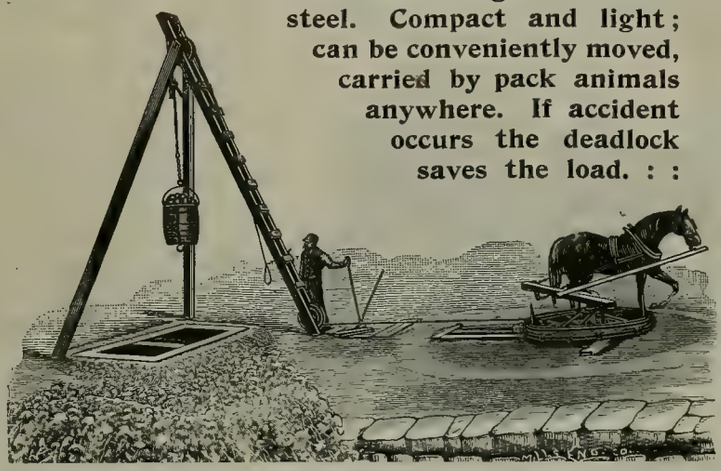
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken [illegible] ceaseless testing and experimenting to produce the superior belt which we now offer, w[illegible]tic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

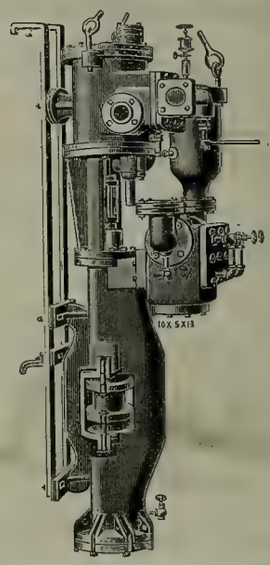


MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

For any information regarding Frue Vanner or Belts, call on or address

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to Adams & Carter.) 132 MARKET STREET, ROOM 15, SAN FRANCISCO.

THE COMMON SENSE WHIM



Is made of the best wrought iron and steel. Compact and light; can be conveniently moved, carried by pack animals anywhere. If accident occurs the deadlock saves the load. : :

SINKING PUMPS,

Indispensable in sinking mining shafts or pumping out flooded mines. Easily raised or lowered by cable or rope. Equipped with outside packed plungers. Handles gritty or dirty water. Operates bolted to shaft timbers or only suspended by cable at any angle. Packing glands external. May be adjusted while in motion. Removable parts hinged. Steam movement positive and simple.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

AND PACIFIC ELECTRICAL REVIEW.

No. 2053.— VOLUME LXXIX. Number 20. SAN FRANCISCO, SATURDAY, NOVEMBER 11, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

American Steel & Wire Co.'s California State Fair Exhibit.

Wire probably plays a more important part in modern life than any other one product of our industries. The extent to which it is used may be realized perhaps from the statistics of the iron and steel wire manufactures of the United States. Every year this country produces about 1,000,000 tons of iron or steel wire. Reduced to pounds this gives 2,000,000,000 as the annual output of the wire mills, or about thirty pounds of wire for every man, woman and child in the United States. If all of this were drawn down to a diameter of $\frac{2}{1000}$ of an inch, one of the larger sizes used for banjo and mandolin strings, it would make a string more than two hundred million miles long, or enough to wrap around the earth 40,333 times, or to form a two-wire metallic telephone line to the sun. The metal which goes to make up this enormous mass of wire is about 10% of the entire output of our iron mines, and the finished product is equal in amount to the average production of railroad rails, and is probably more than enough to form the frames of all the great steel sky scrapers erected in the whole country during the year.

EXHIBIT OF THE AMERICAN STEEL & WIRE CO AT THE CALIFORNIA STATE FAIR AT SACRAMENTO

It would be as easy to enumerate the things in which wire is not used as it would be to give a list of those of which it forms a part. Your spectacle bows are made of wire, the rivets of your pocket knife are wire, your shoe heels are held together with a wire product and you wipe your feet on a wire mat. Your wife is apt to have wire or wire products spread about her costume from head to foot. Her hat frame is often of wire, its flowers are built on wire stems; she fastens it to her head with pins of wire; her girdle and its dependent ornaments are often of wire products, while her parasol or umbrella is largely made of wire. We sleep on wire mattresses, we travel on cars drawn by wire cables and we depend upon wire for all the communications we have with one another over the telegraph or tele-

Propeller Pump on the American River, Cal.

The accompanying illustration is a scene on the American river, Missouri bar, near Folsom, Cal., and shows the working of a propeller pump which is proving useful and advantageous for much of the work in and around mines, combining in itself many desirable features. The pump is shown on the right of the cut, the flow of water from the flume being more than 100 miners' inches, which is the inflow and seepage from a coffer dam up the stream, from a restraining dam below and from a large flume into which the river is diverted. The dams are 1110 feet apart; the river bottom is nearly 100 feet wide and when the pump was first started this area was covered with water averaging 12 feet deep. Despite this inflow, the hole was pumped out in less than thirty-six hours, when the speed of the pump was reduced to accommodate the inflow as is shown. The belt from the pump pulley leads to a common threshing engine, but a more convenient and economic power is a direct connected motor to the pump shaft. The bottom was kept dry and about fifty men were kept at work during the whole summer. The pump here shown is a lift of 30 feet.

WOOD'S PROPELLER PUMP AT WORK ON AMERICAN RIVER, CAL.

The pump itself is an arrangement of simple brass screws and plain spring steel guides along a steel shaft from 3 to 5 feet apart, all being installed in oil well casing. Onto the bottom of the casing may be seen a sinking section, which is simply a section of a casing of larger diameter than the pump casing, and provided with a stuffing box at the top and a foot valve at the bottom, and is lowered by block and tackle, a few inches at a time.

THE present high price of tin and quicksilver is having its effect in stimulating prospecting for the ores of those metals. New tin discoveries are reported from Idaho and southern California, and numerous old and abandoned quicksilver producers are active again, while prospecting for new deposits is in progress.

ON the 14th inst. a convention will be held in San Francisco, Cal., to take some action looking to the conservation of the flood waters of the Sierra Nevadas. This is a proposition so vast in its scope that it is not likely that anything farther than the preliminary steps will be taken by the convention. A succession of comparatively dry years in California has seriously retarded development of mining and industrial enterprises, and the necessity for activity in the direction indicated is now fully realized.

WHEN first undertaking the development of a new mining property it is always well to accomplish the preliminary work and development at as small a cost as possible, employing light machinery and erecting modest, inexpensive buildings. A hoisting engine with a capacity to lift from 500 feet need not have capacity for large daily tonnage, as that is not required in a prospecting or developing plant, nor is a large and elaborate office building essential to the equipment of a prospect. Many a mining enterprise of apparent merit has been wrecked by the extravagance which characterized its preliminary operations.

AMONG the most recent absurdities in the metallurgical process line is that announced in a prospectus of a liquid air company, which sets forth in positive terms its ability to extract from ores and sands containing gold 90% of their value by means of a "mercurial process," in which liquid air plays no part. They have chosen as a field of operation the Adirondacks, where, they claim, is a large tract of sands containing gold. The process is to be introduced in the Western mining region later. The selection of the Adirondacks as a trial field indicates the shrewdness of these new process people, who doubtless realize that in the "Western mining region" their process would quickly be proven by its true merit. Still, in the West fake process men meet with occasional success—in finding credulous investors, who build mills and furnish money for the demonstration of the claims of those who have a process which will "revolutionize mining and the treatment of ores."

The Genesis of Ore Deposits.

No study in geology is more interesting or important than that of the genesis of ore deposits. There are many ideas in regard to the depth to which veins will carry value, and a favorite one is that veins increase in width and richness with depth. That the facts do not bear out this pleasing theory is to be regretted, nor do they disprove it. The exploration of a large number of veins in every portion of the world has shown that as a general principle the width and value of mineral veins bear no relation to depth. In many regions vein croppings on the present surface represent what was at one time at a depth of thousands of feet from the original surface.

There is still a diversity of opinion as to the origin of the minerals found concentrated in veins and ore deposits of various forms, some maintaining that the metallic minerals are derived from the enclosing wall rocks, and others believe that they come from great depth—a depth far below that which human ingenuity and progress can ever hope to reach.

Some eminent authorities suggest that chemical analyses of massive crystalline rocks, made with greatest care, will determine that the minerals found in veins and ore deposits are derived directly from these rocks. If this were so it would seem that valuable accumulations of such minerals would be found in these rocks at a distance from veins, but none have been reported, though miles of tunnel and shaft have been cut through massive eruptive and crystalline rocks. In some mining regions the country rocks have been found to be gold and silver-bearing in proximity to veins and deposits, but there has been no conclusive proof advanced that these values, whether great or small, did not come from the same source as the minerals in the veins. The ascending waters which carried the values from great depths and deposited them in the fissure or zone of pulverized rock, forming a vein or ore deposit, would also penetrate the surrounding rock as well, and, percolating through them, possibly deposit small quantities of their metallic contents. A porous rock dipped in a solution of gold or silver, and allowed to become saturated with it, dried and tested, will be found to contain the metals which were in solution. Massive rocks are dense and in their normal condition not well suited to the deposition of metallic minerals, but in close proximity to veins these rocks often undergo more or less alteration, some of their normal constituents being replaced by others, and in many instances such rock is found to be gold or silver-bearing to a notable extent, while the sulphides of the base metals are of common occurrence.

Probably these minerals were mostly, if not entirely, deposited by ascending waters, while in mines the only waters with which we come in contact and have any opportunity of observing are those descending from an upper to a lower point. Often in shaft sinking a flow of water is observed coming from below with much force; but, if sinking be continued, the level from whence came this particular flow is passed and the water follows the workings downward. It cannot be conceived that the waters coming into even the deepest workings of mines, far below not only the immediate drainage level, but of the sea, as well, have any connection with the deposition of the minerals found in the veins or deposits, and the genesis of the ore deposits must be studied by means of excavations made long after the ore deposition was complete.

Some thermal springs, in the vents of which minerals are being deposited, afford the most satisfactory basis for a theory of ore deposition, but comparatively little importance appears to have been attached to this evidence. Undoubtedly these heated waters have a deep-seated source, and some of them are known to contain a variety of minerals, including those most commonly found in veins, and in some instances these minerals are being deposited about the vents of the springs. The Steamboat Springs of Nevada, a few miles from the Comstock lode, are a notable example.

Risks in Mine and Oil Stocks.

The great industrial activity that now prevails throughout the United States is no where more marked than in mining of every class. Not only are the precious metals being exploited more generally and more vigorously than ever before, but copper, iron, quicksilver, lead and zinc mines are being operated to their fullest capacity. Oil, also, is attracting attention, particularly in California. This widespread activity, taken together with the creation of trusts and combinations of industrial enterprises, large and small, has proven a great incentive to many scheming men to seize the passing opportunity and make something out of nothing, and, as a result, the country is flooded with prospectuses of this or that mine or oil well. Nearly all of these alluring pamphlets contain more or less extravagant statements, but some of them deal in absurdities, and were very evidently written by persons wholly unfamiliar with either the subject of mining or of oil boring.

Mine promoting is not a new enterprise by any means, but the mine promoters have a large stock in trade of "glittering generalities," extravagant statements of the great value produced—by other mines—and the inestimable wealth that may be expected to come from the property, stock in which is offered for sale. Some of these statements are plainly and simply made and are calculated to catch the unwary, when a moment's thought would convince the intended victim that if any such conditions as are stated in the prospectus actually existed, he would not be asked to subscribe for a single share of stock.

The oil promoting scheme is comparatively new, and, as most people are thoroughly unfamiliar with the subject, there is likely to be a large amount of money lost in useless prospecting. Many people think or are led to believe that all that is necessary is to sink a hole in a county where oil is found, and a flowing, or, at least, a pumping well results. The very large percentage of failures clearly shows this not to be the case. In California oil occurs along certain lines of uplift in sandstones and shales, and of the wells bored along these lines a large number become profitable investments; but of the wells sunk at random all over the district in which oil occurs, the greater number are failures. Those contemplating an investment in oil should take the precaution to employ some competent person to investigate the geological conditions before assuming the risk of such investment; for only those who have made a study of the geological structure of the oil regions are competent to pass judgment on the likelihood of striking oil. Some of those who secure large tracts of land and incorporate oil companies have not the required knowledge of the subject, but, as they are on the inside, will lose little in any event.

The Slocan Labor Trouble.

In the Slocan and Sandon districts of British Columbia the labor troubles have not been adjusted, nor does it seem likely that they soon will. The mine managers have been importing miners from the United States and elsewhere, but the trouble seems to be spreading to other districts. The whole difficulty is clearly the result of an act of the last Provincial Legislature in passing an eight-hour law, for which there was no demand. When the time for the law to go into effect arrived the miners were willing to accept the change from ten to eight hours, but demanded the same pay for eight hours' work as had previously been paid for ten hours. This the managers refused. For a time the mines were mostly idle, when a contract system was inaugurated, by means of which it was thought that both parties to the controversy would be satisfied, but some of the miners, taking contracts at a price which earned for them less than the rate of wages they had asked for, demanded that the managers insure them $3.50 per day of eight hours when on contract. This demand was also refused. It seems evident that the trouble would have long since been satisfactorily adjusted if it were not for the labor agitators, but at present there does not appear to be a disposition on either side to make any concession, and the situation grows worse.

Concentrates.

TIN ORES occur in Mexico in the States of Durango, Zacatecas and Sonora.

CRUCIBLE STEEL was invented by Benjamin Huntsman in 1792 near Sheffield, England.

NEXT Saturday's issue of this publication will comprise a total of 52,144,128 square inches of surface.

THE International Mining Congress at Paris will devote June 18 to 23, 1900, to mining and metallurgy.

THE Sierra Blanca mine, near Garland, Colo., is 14,400 feet above sea level, and is said to be the highest mine in the United States.

THERE remain but fifty days in which to do the required annual assessment work on unpatented mining claims for the calendar year 1899.

BAUXITE is a mineral containing a large amount of aluminous oxide. Its hardness, color and density often change in the same deposit.

A NEW alloy of aluminum and manganese has been discovered, which has been found useful for various purposes, and possessing valuable properties.

ADVERTISING consists in describing what one wants to sell in such a way as to create a demand for it. Anything that will sell goods is good advertising.

WEAK solutions of potassium cyanide—.5 of 1% and less—will dissolve compounds of some of the base metals, more particularly those of zinc, copper and manganese.

PEROXIDE OF HYDROGEN is a more powerful antiseptic than bichloride of mercury, and will keep for months without deterioration in properly stoppered bottles.

IT has been estimated that within the past sixty years nearly 300,000,000 tons of rock have been broken down by the Niagara Falls, which is slowly cutting its way up stream.

ANY attempt to form an amalgam of mercury and stibnite or native antimony will result in "sickening" the quicksilver. Antimony cannot be obtained in this manner from ores.

DURING 1898 Great Britain imported 1857 metric tons quicksilver, and exported 1157 tons. German imports and exports for the same time were 560 and 97 metric tons respectively.

THE large profits made by some of the mines of the Witwatersrand is due to the treatment of the tailings by the cyanide process. The gold thus recovered would otherwise be lost.

THE deepest mine shaft in Colorado is said to be at the California mine, Quartz Hill, Gilpin county—2230 feet, though the Geyser mine, Gilpin Co., is now reported to have a shaft 2650 feet deep.

THE signatures of the president, secretary and general manager of an incorporated mining company would make a contract so signed binding on the company were its conditions complied with.

ACCORDING to the "basis of representation," California would be entitled to 2045 delegates at the Milwaukee session of the International Mining Congress next June, though it is doubtful if that number will attend.

CINNABAR occurs in Texas near the Rio Grande river, eighty miles south of Alpine Station. The ore occurs in massive limestone and silicious shale and in brecciated rocks. Calcite is usually associated with the ore.

ELECTROLYSIS—the corrosion of metal by electric current—is caused by difference of potential, distance, etc., and influenced by the character of the soil. A difference of potential of two and one-half volts may destroy water pipe in two years.

WITH extremely dilute solutions of cyanide of potassium some workers have found that in order to get a good precipitation from solutions containing copper it is necessary to pass the solutions very slowly through the precipitation boxes.

AT the nickel mines near Riddles, Or., several hundred tons of ore are being prepared for shipment to Chicago as a test of its value. These mines have been closed down nearly five years. At one time 150 men were employed and an extensive plant erected.

NATIVE GOLD is not infrequently found in the undecomposed portions of crystalline and eruptive rocks. This is not an uncommon occurrence in the mines of the granite area of California. As far as observed, these occurrences are in the immediate vicinity of lodes.

COPPER ores occur in Texas, in Archer and Wichita counties, in the Peruvian formation. The ores occur as pseudomorphs after wood and various fossils. These ores are carbonates and silicates of copper and are found in the marls and clay slates and in part also in sandstone.

A GENERAL answer to a question the answer to which must take note of numerous and varying factors will be of little value. Questions to "Concentrates" should state plainly the proposition and not require averages where there is a wide latitude in conditions and results.

THE occurrence of gypsum in the rock strata of the California oil field is frequently noted, and some have looked upon gypsum as an indication of oil. Such is not the case, as gypsum has nothing in common with the occurrence of petroleum, and either may occur without the other.

THE gold-bearing ore bodies found in the mines at Raposas, State of Minas Geraes, Brazil, are found in the form of rudely circular chimneys, following the dip of the argillaceous slates. They are composed chiefly of quartz, with 8% to 10% auriferous pyrite and pyrrhotite, with iron oxides.

DRY ground containing gold must be thoroughly disintegrated to make a saving of the gold possible in a dry washer. Lumps containing clay must be pulverized, and these machines are not usually provided with any mechanism for accomplishing this. In dry regions where this method of mining is practiced and stamp mills are cheaply accessible, a good plan is to partially concentrate the alluvial and treat the concentrates in the stamp mill. This saves much time and consequently increases the capacity of the machine, while saving the fine gold which escapes most machines.

WHEN mineral veins have been located in accordance with legal requirements on the public domain the title to town lots to be acquired shall be subject to such recognized possession of the mining location and the necessary use thereof. This applies to all except the Federal Government itself.

WHENEVER possible, it usually pays to catch up surface water on the upper levels and pump or hoist it to the surface, not permitting it to go to the bottom of the mine. Where this is done, many mines are comparatively dry in the lower levels, such water as there is coming largely from the surface.

THE United States statutes do not require a mining claim location to be placed upon record, though most State and local district laws make this necessary. For the purpose of security of title locators should record their claims with the local district recorder, if there be one, and also with the county recorder.

THE construction of ore pockets under the floor of levels at shaft stations is found to effect a great saving in handling ore or waste. Skips or buckets may be used, the former being better suited to the requirements. By this arrangement neither underground trammers nor the skip men are kept waiting.

THE large skips in use in the Kimberly diamond mines are hoisted through a portion of a 1400-foot lift at a speed of 6000 feet per minute. The necessity for having shaft timbers absolutely true under such circumstances is obvious. The round trip is made from surface to 1400 level and return in less than one minute.

TELLURIUM was discovered by Muller von Reichenstein in 1781. It is now found to occur much more abundantly than was at first supposed. The two most important districts where gold tellurium ores occur in the United States are in the Cripple Creek district, Colorado, and the Terry Peak region of the Black Hills, South Dakota.

IN shaft sinking, where a steam pump is in use, a lever may be attached to the steam inlet valve and wires attached, allowed to hang within reach of the miners below, who can by this means regulate the operation of the pump to the quantity of water coming in, saving much time and rendering much signalling to the engineer unnecessary.

SOME of the South African mines are being worked under Boer martial law at Johannesburg, but an interruption of the usual gold supply for six months is to be expected. Still, with an entire year's gold production of the Transvaal cut off, the world's product would be over $10,000,000 more than the average for the four years ended with 1898.

THE Stetefeldt furnace was designed for the chloridizing-roasting of silver ores which were to be subsequently treated by amalgamation or lixiviation. It was first introduced for actual practical work on a commercial scale at Reno, Nevada, in 1869. The pulverized ore mixed with salt is fed at the top of the upright shaft, falling through the flames resulting from burning gas or wood.

THE ores of the Boston & Montana Con. Copper Co. are mined at Butte, Montana, and transported by rail 170 miles to Great Falls, on the Missouri river, for treatment. The higher grade ores are smelted in blast furnaces, reduced to copper matte containing 50% to 55% copper. The low-grade ores are concentrated and roasted in rotary furnaces and reduced to 50% or 55% matte in reverberatory furnaces.

MAGNETIC separation has been suggested as a practicable means of concentrating the black sands found in the gravels of many gold-bearing river beds and ocean beaches. A difficulty will probably be found in effecting a complete separation, as much of the iron in these sands is not magnetic. It has not been ascertained whether the gold values are in the magnetic or the non-magnetic portions, or in both.

THE Ducktown copper mines are in the southeast corner of Tennessee. The ore occurs impregnating silicious schists. It is all sulphide material of low grade. In the early history of the mines large amounts of black oxide of copper were mined, leaving the purer sulphide ores for later years, when cheaper labor and supplies and advanced methods of mining and treatment made the operation of these mines again profitable.

IN the issues of Aug. 5th and Aug. 12th, '99, appeared two articles on the oil-yielding formations of California, and conditions under which petroleum is found, written by the best local authority on that subject and giving all the information asked in a scientific, practical and intelligent way. Some of the numerous oil stock companies are traps for the ignorant, and their handsome stock certificates likely to be of most value for wall papering purposes.

IN deep mine pumping, where is employed an electric motor coupled direct, an efficiency of about 85% given out from the generator might be expected. There would probably be 3% loss with transformer and line, 8% on the motor, and, probably, 8% in the gearing, etc., of the pump, giving about 68% for actual work. An engine driving a dynamo continuously, to do as well as one on the direct-coupled pump, using thirteen pounds of steam per indicated H. P., would take 624.5 pounds of coal per day, a duty of 71,937,405 foot pounds for every 112 pounds of coal.

IN the California oil fields the general topography of the country has little apparent relation to the oil-yielding deposits. In the general uplift of certain hills and mountains the oil lines do not always conform to the main axes of uplift or folding, but are most commonly found along subsidiary sharp folds whose existence would remain unknown but for careful geological investigation, as the erosion of the hills has been influenced mostly by the larger folds and not affected materially by the smaller ones, along which the oil is usually found. Oil lines found in the hills may, and sometimes do, extend out under the level adjacent valley, the crest of the fold having been planed off by erosion.

THE Broken Hill Proprietary lode in New South Wales, Australia, is in places over 300 feet in width. It has yielded large amounts of silver which is found associated with sulphides of lead, iron and zinc, together with other bases of less frequent occurrence. The Broken Hill Consuls, near the Proprietary mine, is a distinct vein 18 inches in width which has been opened 1300 feet and found persistent. It strikes east and west and has a variable dip. The valuable ore deposits worked along this vein are found where cross veins intersect it. In this lode was found a mass of dyscrosite (antimonial silver) which weighed 1600 pounds and yielded over $21,500. Six tons of this mineral yielded 142,000 ounces silver.

NICKEL has physical properties similar to iron and copper. It is less malleable and ductile than iron and less malleable and more ductile than copper. It forms alloys with these metals in all proportions. Its specific gravity is about the same as that of copper, but is heavier that iron. Its melting point is about 3000° Fahr., though a small percentage of carbon in metallic nickel lowers the melting point considerably. When alloyed with other metals it generally adds hardness, toughness and ductility to them. German silver is an alloy of copper, zinc and nickel. Variations in the percentages of the several metals give different names to the composition, as British plate, white metal, argentan, Chinese metal, etc.

AT large mines where many samples are taken daily from the stopes, headings and exploratory openings, an effective sampling works may be cheaply made by mounting a power drill upon an upright frame of timbers, substituting a small stamp head for a drill and placing a heavy circular mortar beneath to receive the rock. A brick oven with an iron plate for a top will furnish a good drying surface, upon which the samples may be placed in steel pans to dry before pulverizing. With an arrangement of this kind 100 samples of two pounds each may be made daily at small cost. Either air or steam may be employed to run the stamp, and a single man can attend to the drying and pulverizing of all the samples, keeping check of them by a running number. When the ore is free-milling gold, the samples may be panned, but in most cases assaying will be necessary.

IN the *Annales des Mines* appears some data regarding the Laurium mines in Greece. In ancient times the deposits, which consist of zinc blende, pyrites and argentiferous galena, were worked for silver. At the time of Pericles the population of Laurium exceeded 20,000. The mines were worked by slaves, the shift lasting ten hours, and work going on continuously. The system of slavery led to the miners being treated with comparative kindness, as the death or illness of a slave represented a direct monetary loss to his master. In the fourth century the average price of a mine slave was £6 10s. Owing to the varied applications of silver at that date there was no overproduction of the metal. Its value in relation to gold was 1 to 14 in the year 438 B. C., and 1 to 10 in the year 300 B. C. The Laurium mines made Athens the silver and lead market of the ancient Greek world.

THE silver mines of Cerro de Pasco, Peru, were discovered in 1630 by an Indian shepherd. They are estimated to have produced since their discovery $565,000,000 in silver. They are at an altitude of 14,250 feet above the sea. The argentiferous deposit is described as consisting chiefly of a ferruginous sandstone, in the neighborhood of limestone, conglomerate and slate. A tunnel 3500 feet in length was run at a cost of $100,000 to drain these mines. It required twenty years to complete it. A second tunnel, 88 feet lower, was run 8250 feet in forty-six years at a cost of $1,000,000. At a mile from its entrance the tunnel branches, these branches having a total length of a mile. A third tunnel was started in 1877, but when in 900 feet was abandoned. These mines produce gold, silver, copper and lead. Most of these ores are amalgamated by the patio process in seventy mills. The higher grade of lead ores are smelted.

THE cost of concentrating sulphide ores in California or elsewhere varies at each mine and is dependent upon the character of the ore, quantity treated per stamp or otherwise, method of concentration, and to a great extent upon the percentage of sulphide mineral occurring in the ore. An average cost would be difficult to obtain and having been gotten would signify nothing in any particular case. In a single instance the cost of labor for concentration was 13.5 cents per ton of ore treated, and for power about 6 cents per ton. At another mill, where the ore contains 2% sulphides, 100 tons are crushed daily. The cost for labor is $18 per day, or 18 cents per ton of ore treated. The stamp capacity is two and a half tons per stamp. Power costs about 5 cents per ton for concentration. In a third mill four tons are treated per stamp daily, and the concentrates average 3%. The cost of concentration for labor is 75 cents per ton of ore treated, and power costs 4 cents per ton of ore for concentration.

IN some of the large Spanish mines a system of mining is followed by means of which large veins of ore are wholly recovered without the use of timbers and with a minimum of accident to men. The ground is blocked out by running lateral drifts and crosscuts, and connecting them by raises, to be used later for passing ore and for ventilation. A main working shaft is sunk in the wall, and a second shaft is provided for lowering waste rock into the workings, for filling the excavations left by the removal of the ore. When the level has been thus prepared by blocking out, the crosscut run from foot to hanging wall, opposite a raise, is filled by hand with waste rock broken on the surface; this being done, two additional crosscuts are run, one on either side of the first, and these filled in like manner from hanging to foot wall. In this way, working cut after cut, an area previously determined is mined and filled. A crosscut is then run immediately above that first made, opposite the mill hole, down which the ore is thrown to the level below. When completed, this crosscut is also filled like those below. The ore may then be mined in comparatively inexpensive manner, being undercut and cut out on one side. Slice after slice is cut off, the space being filled with waste until an area on this floor is removed equal to that below. The third and fourth floors are removed and filled in like manner, and so on until the level of the block above has been reached. All the waste used consists of good-sized rock, no small material being employed, and this is placed by hand, as in a wall. The labor is cheap, and the expense not greater than timbering and subsequent filling, and the system admits of the recovery of all the ore, which cannot be accomplished at all times by other systems. The amount of subsidence is small in a level thus mined and filled. It would seem that the placing of heavy lagging on the sill floor would afford an advantage in stoping up under an old level. This system affords great security to workmen, and, as no ores are lost, it might be employed in some of the large gold mines of the United States to greater advantage than some of the systems now in use, by which disastrous caves and the loss of life and often of large bodies of good ore often occur.

Prehistoric Rivers of California.

Written for the MINING AND SCIENTIFIC PRESS.

The ancient rivers of California are always an interesting subject for study. In the course of their investigation one cannot help wondering how long a period has elapsed since their formation. These channels are found in the foothills of the Sierra from the most northerly counties of California to the most southerly, and they lie at elevations varying from 200 to 9000 feet above sea level. The greater number of these channels and those producing by far the greater amount of gold are found at altitudes varying from 1000 to 4000 feet.

In some sections these channels occur singly; and being capped with a lava flow the hardness of which has resisted better than the underlying country rocks the process of erosion which has been in progress for ages, these channels are found outlined against the sky when viewed from the neighboring valleys, forming long, gently sloping flat-topped ridges. In other sections of the State are found numerous channels of varying ages, these often intersecting each other, the newer cutting across the older channels, and each with its separate lava flow. These latter often differ in character, thus affording an additional means of determining the relative ages of the underlying channels.

One of the most complex and most interesting channel systems in California is that in the vicinity of Mokelumne Hill, in Calaveras county, where are found no less than ten channels, each distinct from the other and each possessing distinctive characteristics in the material composing the gravel beds themselves and in the overlying volcanic capping. There are other channels in the region, the identity of which has not as yet been satisfactorily established. Some of these Mokelumne Hill channels were among the richest ever discovered in California and produced large amounts of gold in the early days of mining in the State.

In making a study of these channels it was found that their relative altitudes could not be taken as indicating their respective ages, though, generally speaking, the higher channels are the older and the deeper channels the later. To this there are important exceptions.

Those channels of higher altitude lie far above the recent drainage system, of which the canyon of the Mokelumne river is the deepest. Some of these old channels are 700 to 800 feet higher than the bed of the river canyon, though the deepest of the ancient river channels are deeper than the gulches in their vicinity, but still far above the canyon of the Mokelumne.

With two exceptions, so far as observed—the channels known as the Concentrator, which enters Calaveras county from Amador county on the opposite side of the Mokelumne river, and the Kreamer channel, which lies under Golden Gate ridge—the respective ages of the various channels may be determined by their relative altitudes. The two channels forming this exception not being intersected by or intersecting other channels, where a study of the occurrence—if such these be—could be made, no determination of their ages as related to other channels of the district was possible. Upon a petrographical basis the Kreamer channel, containing abundant lava, cobbles and boulders, would be classed among the more recent channels, it being evident that its formation has been subsequent to the andesitic eruption which covered some of the older channels, as its detritus is found forming a large part of the Kreamer channel, which is gold-bearing. This channel also contains quartz and bedrock material, derived directly from the bedrock series and also in part possibly from some preexisting channel, which it may have intersected in its course.

The Concentrator channel, as above stated, enters Calaveras county from Amador, lying side by side with the more recent Duryea channel for several miles, but about 80 feet lower than the latter. They pass underneath Stockton ridge, a lava-capped eminence extending several miles in a southwesterly direction from Mokelumne Hill, and underneath this ridge these two important ancient streams suddenly diverge, the Duryea channel maintaining its southeasterly course and the Concentrator channel bending abruptly to the southward, becoming lost by erosion about four miles southwesterly from Mokelumne Hill. The Duryea channel passes through Stockton ridge, emerging on Chili gulch, and is cut out by that modern stream; but as it fails to reappear anywhere in the vicinity, there is reason to believe that it joins the Tunnel Ridge channel on the opposite side of Chili gulch. The Tunnel Ridge first appears near the head of Indian gulch, east of Mokelumne Hill, in the Happy Valley mine, and flows southwestward—a broad, well-defined channel, and one which has been extensively worked by both hydraulic and drift methods. The point at which the Duryea channel joins the Tunnel Ridge channel, if such be the fact, is obscured; but either this must have occurred or the modern stream—Chili gulch—has completely eroded the ancient stream, usurping its bed and eventually cutting into the underlying bedrock 100 feet or more. This latter supposition, however, has little to support it.

The devious course of the numerous channels of the district is directly due to the process called superinduced erosion, by which streams have cut their channels in the lava beds capping the previously existing rivers, either flowing along the edge of contact between the lava and bedrock or meandering across a broad expanse of the volcanic material. Having once established their course, the erosion of the channel progressed regardless of the superior or inferior hardness of the underlying rocks. In a rude way the courses of some of these channels have a certain parallelism, indicating that of two streams whose courses lie nearly parallel, the later had first cut its way along the edge of the lava flow overlying the earlier channel. The Concentrator and Duryea channels and the Tunnel Ridge and Old Woman's gulch deep lead, on Spring gulch, are examples of this condition.

The lava flows which cap the numerous channels in different portions of the State vary greatly. Some are covered with snow-white rhyolite tuff, above which may be a breccia of andesitic materials. Others are covered with a mud of volcanic origin, with tufa and breccia overlying. Some have a cap of black basalt, though they are mostly capped by either hornblende or augite andesite. When the former, the volcanic rock occurs as a mass of broken, angular fragments in an andesitic mud. The augite andesites are more massive, and, like the basalt caps, are consolidated from a flow of molten rock. These frequently assume a columnar structure, the prisms being from a few inches to 2 feet in diameter, having four, five or six sides. They are often 8 to 15 feet in length.

The hornblende andesites are apparently older than the augite andesites and basalts. In the southern portion of the State, south of the Tehachapi mountains, the gravel channels have no lava cap, so far as observed by the writer. In the Mokelumne Hill region all of the lava caps are composed of rhyolite tuff and andesitic breccia.

Of the deepest channels—that is, those of lowest altitude, there still remain large amounts unworked by reason of the great volume of water contained and the consequent expense of mining. The Old Woman's gulch channel is one of this class and its only exposure is on Indian gulch, a mile east of Mokelumne Hill; but, unfortunately, it is where it passes under the lava hills on its downward grade, and within a mile it has passed below the drainage level of the vicinity, rendering pumping necessary to mine the deposit.

Notwithstanding these difficulties, numerous inclined and vertical shafts have been sunk along its course for several miles and a large amount of gold recovered. The gravel from this channel is of a dark olive to bluish color and the channel is called the "Deep Blue Lead." There appears to be a belief, almost universal among the miners, that channels in which the gravel is blue must necessarily be richer than those channels in which the gravel is red or yellow. The history of mining on these channels does not support this theory, nor is there any reason for such belief. The red and yellow channels (they are mostly red) owe their color to oxidation, being at or near the surface, where the drainage and atmospheric agencies during ages have completely oxidized the iron minerals, the iron oxide coloring the gravels a deep, rich red or a tawny yellow. The extensive hydraulic operations carried on here in early days has left numerous large pits, the banks of which are red or yellow, and there form a very striking and picturesque feature of the landscape.

One of the most noted ancient streams of the district is the Chili gulch channel. It has several distinguishing features and the character and color of the gravel in this channel proves that the color of the gravel has not material connection with the richness of the channel. All of those channels occurring above the drainage level of the country are red or yellow; all of those below it, as the Old Woman's gulch blue lead and the lower end of the Chili gulch channel, are blue, though the upper end of the Chili gulch channel, northeast of Mokelumne Hill, is bright red. This channel has a width of 20 to 60 feet and is very crooked in its course—the most erratic in the district. The lava cap has been removed by erosion from its upper end, which appears in scattered remnants, the recent erosion having cut out considerable portions of it, the gulches below being consequently enriched. This channel strikes directly into the north end of Stockton ridge, under which it runs for some distance, reappearing in Chili gulch winding from side to side, and at a depth of 100 feet or more below it.

The material in this channel consists of white and dark bluish quartz bowlders and cobbles, silicious brown iron stone, masses of flint, a small amount of hematite in pebbles and cobbles, considerable slaty and schistose bedrock and more or less rock of eruptive origin. The character of this material shows clearly that it is derived from the Calaveras formation lying east of Mokelumne Hill, and the channel probably has its source in Amador county in the vicinity of Volcano. It cuts through several channels under Stockton ridge, indicating that it is not the oldest channel in the district.

The Tunnel Ridge channel is a broad, remarkably straight one, which, as previously stated, first makes its appearance in the Happy Valley mine, a mile east of Mokelumne Hill. It also undoubtedly has its source in Amador county in the direction of Volcano, though its size and the volume of material it carries indicate that its source is probably in the Sierra Nevada. In this channel are found boulders of white and blue quartz weighing many tons. It also contains a large amount of slaty material and rocks derived from quartzite beds and silicious schists. Among rocks of the latter type are found pieces which may be classed as itacolumite—a flexible sandstone, this being slightly so. This rock is said to be of frequent occurrence in the Brazilian diamond fields; and although no diamonds have ever been reported from the Tunnel Ridge channel, they have been found at Volcano and at Rancheria in Amador county, a few miles distant from which direction the Tunnel Ridge channel undoubtedly came. There are no eruptive rocks in this channel, and the gold is high grade. It was noticed that in channels of this vicinity having a high grade of gold there was an absence of eruptive rocks derived from the bedrock series, though such channels might contain the later volcanic rocks.

In the Green Mountain claim of the Tunnel Ridge channel have been found some remarkable deposits of opalized wood and tons of quartz crystals of large size, some of them weighing more than 100 pounds and of unusual transparency, having nearly perfect hexagonal forms with pyramidal terminations. They are found embedded in the tufa. The opalized wood also affords specimens of great beauty, though silicified wood is not unusual in the ancient rivers. In many places the petrified stumps of large trees are found embedded in the lava or mud, on the rim of the channel, showing clearly that the trees had grown upon the bank of the ancient stream and had been enveloped in the rush of volcanic mud and sand, becoming subsequently altered to stone.

One of the most noted channels of the district is the French or Nigger Hill channel, northeast of Mokelumne Hill. Only a small remnant remains of this channel, which is said to have been the richest ever found in the district. The remnant lies on the western slope of French hill. On the east side the bedrock rises to the summit of the ridge; on the west it has been eroded till only a small portion remains. The gravel is covered by a tough, mud-colored tufa which is overlaid by red hornblende andesite. The channel was dry, accessible at each end of the remnant and consequently quickly exhausted by the early miners who employed six-shooter and shotgun, as well as pick and shovel, in the maintenance of their claims. A large amount of coarse gold was taken from this small remnant of channel. It is said upon one occasion, while contending owners temporarily left their claims and were endeavoring to adjust matters before a magistrate in the village half a mile distant, several gamblers, taking advantage of the opportunity, hastened to the mine and in less than two hours secured over $3000 with pans and rockers.

An estimate of the amount of gold taken from the channels of the Mokelumne Hill is a difficult thing to arrive at, as the sources of information have long since disappeared; but that there still remains a large amount in the unworked portions of these channels there is no doubt.

In fineness the gold of the district ranges from $17.50 to $19.50 per ounce, the latter being found in the upper part of the Tunnel Ridge channel, in and near the Happy Valley mine.

The Most Notable Electric Transmission Plant in Existence.

To-day the most notable transmission plant in existence is that of the Southern California Power Company, designed to carry 10,000 H. P. at 33,000 volts over eighty-three miles of line from the power house to the city of Los Angeles. The southern California power house is situated at the base of the San Bernardino mountains, on the Santa Ana river, and the power water intake is at the junction of Bear creek and the Santa Ana river, about seven miles below the famous Bear creek dam. The water in this river, like all waters in southern California, is owned by water companies, and as soon as it reaches the valley it is led off in irrigation ditches in different directions. Under these conditions, any power company using the water must not interrupt the flow, and the regulation of the Pelton water wheels which are used must be by deflecting nozzles. The water is carried about two and a half miles, 80% of which is through tunnels, and the rest of the canal is open masonry and wooden flumes. The elevation at the intake is 3422 feet above sea level, and that of the power house 2670 feet. The difference, less the grade of the canal, gives a static head of 735 feet on the wheels.—Cassier's Magazine for November.

Mines of Ouray County, Colorado.

The American-Nettie M. Co. of St. Louis own and operate the American-Nettie mine, and work the O. & N. Tunnel mine under lease. The two properties adjoin each other and are situated along the rocky cliffs, nearly 2000 feet above the valley. The Nettie ores are found in a contact ledge that cuts the mountain almost horizontally, the ore occurring in irregular shoots and kidneys, extending from shale above into the quartzite below. The earlier workings were in oxidized ore, very rich in gold; later workings have brought them into iron and copper sulphides at greater distance from the surface. The property has been operated about ten years and the underground workings aggregate about five miles of drifts and tunnels. Present limits are about 2000 feet from the surface in a horizontal line. About 100 tons per month are being mined which is sufficiently high grade to ship direct to the smelters. Forty-two men are employed.

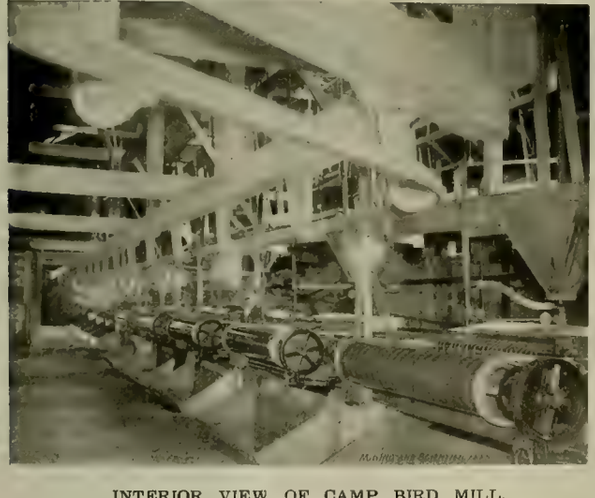
The Bachelor mine is developed by three tunnels. The lower one of these runs 750 feet as a crosscut to the vein, then follows on the latter 1300 feet. At a point in this tunnel, 730 feet from entrance, a shaft sinks 115 feet by the side of the ore body. The second tunnel, 265 feet above the first, and the third tunnel, 90 feet above the second, each crosscuts 300 feet to the lead, then drifts on the latter about 1300 feet. This system of tunnel work is all connected by winzes and shoots. About twenty-two cars per month are shipped direct to the smelters and the remainder is run through the Bachelor mill, the product of the latter being eighteen cars of concentrates per month. The mill is equipped with crushers, rolls, revolving sizers and Bartlett concentrators, and operated by a gasoline engine. The Bachelor milling ores are of gray copper and zinc base, carrying values of 8% to 10% lead and 20 to 25 ounces silver. The concentrates carry 30% to 35% lead and 100 to 150 ounces silver.

The Caliope, belonging to C. H. Nix, and in charge of F. A. Sparks, is operating successfully. At a point in the tunnel, 1650 feet from the entrance, a shaft has been sunk 75 feet on the ore body, from which present product comes. The principal value in the ores is silver and lead. The output is six to seven cars per month of concentrates and eight cars per month of crude ore for the smelters, making 360 tons of ore per month.

The Neodesha, which is supposed to have the same ledge as that of the Bachelor, is being worked under lease. A tunnel has been driven to the ore body, which comprises gray copper, silver and lead, shipments of which amount to about three cars per week.

The Camp Bird mine has a location at the head of Imogene basin, at an altitude of over 11,000 feet, and is only about two miles from the Tom Boy mine in Savage basin, a lofty mountain spur separating the two basins. The Camp Bird vein trends eastward and westward along the northern slope of the range and the Tom Boy parallels it on the opposite side. A crosscut tunnel strikes the Camp Bird ledge at right angles, 700 feet from tunnel entrance. The vein is between well-marked trachyte walls, runs from 20 inches to 8 feet in width and dips slightly toward the south. The ores are a rather hard sugar quartz, fine in texture, bearing free gold, with streaks of sulphurets. The walls, while of a trachyte nature, show evidence of being sedimentary in character. On the tunnel level there are 4000 feet of drifting on the vein—2000 feet east and same distance west from the crosscut. This work shows that while the ledge waves considerably, it maintains a straight east and west course. At a point farther down the slope a new tunnel, 7x8 feet in size, is being driven to crosscut the ledge 300 feet lower than the present workings and about 2000 feet from the tunnel entrance. At present the breast is in about 1400 feet. When this tunnel shall have reached completion the output of the mine will doubtless come through it, as it will be equipped with electric haulage facilities. At the mouth of the new tunnel is the terminal of the tramway line which delivers the ore to the Camp Bird mill, three miles farther down the canyon. Near the same tunnel is the new mine boarding and rooming house, 40x150 feet and three stories high, with dining room 40x82 feet; forty-seven rooms 14x14 feet, heated throughout by hot water and lighted by electricity, with bath and wash rooms equipped in the same fashion. The kitchen is provided with steam cooking apparatus. The power and light at the mine are furnished by electric currents transmitted from Ames in Ophir canyon, twenty-three miles away.

The Camp Bird mill has forty stamps, 800-pound weight, dropping ninety to the minute, which crush from 100 to 120 tons of ore per twenty-four hours. The machinery is run by water, assisted by steam power in the winter season. About 70% of the values are saved on the amalgam plates, the remainder in concentrates from twenty Frue vanners. An addition is being built to the mill for the purpose of milling lead-silver ores which come from a different mine under the same ownership. The entire property belongs to Thos. F. Walsh of Ouray; it is under the active management of J. W. Benson, with W. H. Coates as mill superintendent and E. Collins as mine superintendent.



As Imogene and Savage basins are complements and opposites, as above described, so Marshall and Yankee basins similarly match each other, the former facing toward Telluride and the latter toward Ouray. On the lower benches of Yankee is the deep shaft and incline of the Virginius mine; on a bench 2000 feet below it is the entrance to the Revenue tunnel and the 80-stamp concentration mill, all the property of the Caroline M. Co. The tunnel and mill are at an altitude of 10,300 feet and the shaft house of the Virginius mine 12,300 feet. The Revenue tunnel, equipped with electric haulage apparatus, has reached a point 7600 feet from the entrance, giving a vertical depth of 3000 feet to the surface. The Virginius shaft starts from an interior tunnel station, sinks vertically 1100 feet to a point where it connects with an incline, which sinks to the Revenue tunnel, a vertical depth of 1100 feet farther, making a continuous passage of 2200 feet from tunnel level to collar of shaft. Near the breast of Revenue tunnel a new vertical shaft is being sunk adjacent to the hanging wall of the ore body. It is to be sunk to 1100 feet depth, with the intention of running crosscuts through the ledge at 600 and 1000-foot stations. Shipments from this property amount to about 1000 tons per month of sorted ore and concentrates. The ore is a silver-lead composition, that which is milled being reduced in the ratio of six to one. The output all comes through the Revenue tunnel and from above the tunnel level. Mill, compressor, tunnel cars, etc., are run by electric power, generated by water pressure at two power plants several miles down the canyon. However, a new 90 H. P. engine has been installed at the mill to supplement the electric power during the winter season. The illustration presented herewith gives a view of the mill and other buildings, including the covered car trackage

from mill to tunnel. E. A. Krisher is mine superintendent and W. A. Garrett mill superintendent.

The Grizzly Bear mine, located up Bear creek, on Red Mountain road, is developed through three tunnels, a vertical distance of about 100 feet apart, each going in on the vein of siliceous ore, bearing gold and silver. The lower tunnel has been driven 600 feet.

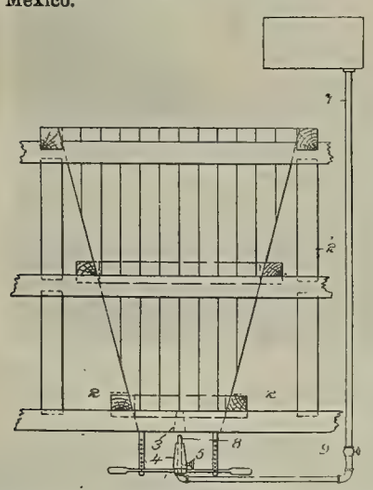
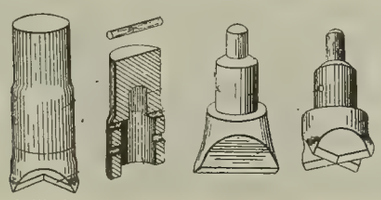
Latest Mining and Metallurgical Patents.

Patents Issued Oct. 31, 1899.



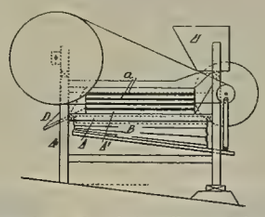
Specially Reported for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR SEPARATING SULPHUR FROM ORES.—No. 635,574; J. B. McCabe, Buffalo, N. Y.



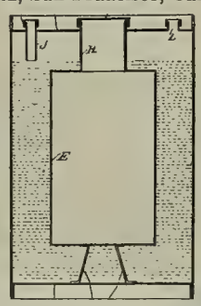
In an apparatus for separating sulphur from ores, the combination with a barrel-shaped boiler having a discharge opening in its bottom at about the center, of a barrel-shaped cylinder having a perforated rim and hollow trunnions by which it is mounted in the boiler, one of the trunnions serving as an inlet and the other as an outlet, and a pipe leading from the outlet to within a short distance of the rim of the cylinder. The combination with a boiler having a discharge opening in its bottom, a shaft mounted in the boiler and having hollow ends projecting out through the ends of the boiler, a cylinder secured to the shaft and having a perforated rim, and a pipe secured to the shaft and communicating with one of the hollow ends thereof, pipe extending to within a short distance of the rim of the cylinder.

ORE FEEDER.—No. 635,781; R. H. Jeffrey, Pinos Altos, Mexico.



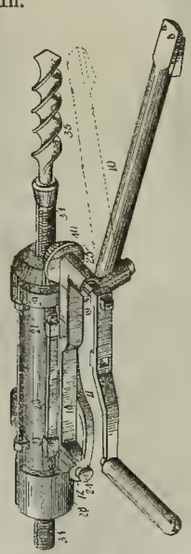
In combination, a hopper provided with a lower tapered discharge opening, a water supply pipe terminating in a nozzle, vertically adjustable with respect to discharge opening, and a conical peg adjustable upon the nozzle.

DRILL.—No. 635,415; H. Aylmer, Richmond, Canada.



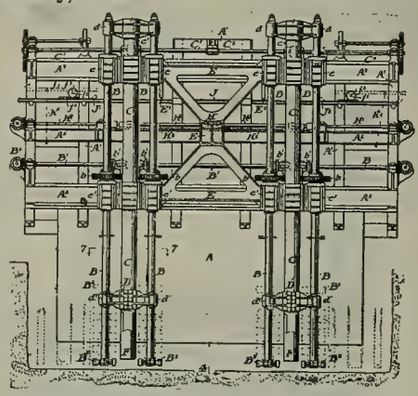
In a drill the combination with the stock having the receiving socket therein, of a bit having a shank with an inwardly tapering or inclined portion, stock having an opening leading therethrough to the inclined portion of the shank whereby an instrument can be inserted in opening and brought to bear on incline portion to dislodge the bit.

APPARATUS FOR CONCENTRATING DRY PLACER MATERIAL.—No. 635,886; A. Chaumeil, Caborca, Mexico.



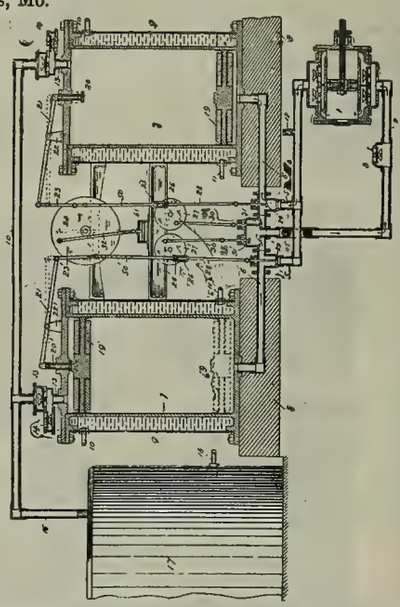
The combination of a laterally and longitudinally inclined flexible surface or support carrying a plurality of riffle bars disposed parallel with the sides of the surface or support, a hopper arranged to deliver material at the higher end of the surface or support, spouts at the lower end and along the lower side of the surface or support, and an air blast generating device arranged to deliver air blast against the under side of the surface or support. The combination of a laterally and longitudinally inclined open work framing, a flexible surface of canvas or the like on framing, a plurality of riffle bars carried by the canvas and disposed parallel with the sides of the framing, a hopper arranged to deliver material at the higher end of the canvas, a partition operating to guide the material from the hopper to the canvas, a spout at the lower end of the framing, a spout at the lower side of the framing, and a bellows below the framing adapted to deliver an air blast upon the under side of the canvas.

APPARATUS FOR THAWING EXPLOSIVES.—No. 635,945; W. J. Smith, San Francisco, Cal.



In a thawing apparatus, the combination of an outer tank, an inner tank, the walls of the tanks being spaced apart to form a chamber around the inner tank, the outer tank being provided with a chime at its upper end having openings, and with a head having an opening for the passage which communicates with the inner tank, and with an inlet and an outlet for the heating medium, the passage inlet and outlet extending above the openings in the chime.

MINING DRILL.—No. 635,905; W. R. Wallace, Mount Vernon, Ill.



In a mining drill, the combination with a sectional boxing having a plane unthreaded bore, and means for holding the sections of the boxing in locked position, of a feed nut having an unthreaded exterior face and fitted therein to rotate on its axis, means for restraining the nut against endwise movement in the boxing, a bit shafting engaging with feed nut, and a latch device adapted to be connected to feed nut to hold the latter in a stationary position within the boxing or to permit feed nut to rotate in the boxing with the bit shaft. In a mining augur, a sectional boxing consisting of a base member having the flange and keepers on one side, and the upper member hinged to the base member and flanged to fit the flanged edge and keepers of base member, combined with a feed nut fitted in the boxing, a bar key fitted to the keepers and engaging the flanged edge of the hinged member, a latch pin separate from the bar key fitted to the hinged member to engage with the feed nut, a bit shaft, and a driving mechanism.

DREDGING MACHINE.—No. 635,890; S. A. Hill, Atlantic City, N. J.

In a dredger, the combination of a pump mounted thereon, a suction pipe vertically movable with relation to pump, a revoluble cutting shaft, means for revolving shaft, means for transversely reciprocating shaft with relation to the pump and means to adjustably shift shaft in the direction of its length and with relation to the pump, whereby the described adjustment of the cutters with relation to the dredger may be effected without moving the pump.

AIR COMPRESSOR.—No. 636,013; G. W. Tolle, St. Louis, Mo.

In an air-compressing apparatus, a suitable air pump, a storage tank or receiver, two communicating cylinders interposed between the pump and receiver, pipe connections establishing communication between the cylinders, and the pump, a piston for each cylinder, pipe connections between cylinders and receiver, suitable valves controlling the several pipes, the pump being adapted to force atmospheric air under the piston of either cylinder, and subsequently circulating such compressed air alternately from one cylinder to the other, and a check valve located in the path of the supply pipe of the pump for permitting the flow through the pump of additional atmospheric air into the cylinders to effect the reciprocation of the pistons and forcing the air in front of such pistons into the receiver. A receiver, a series of two cylinders communicating therewith, pistons for cylinders, an air pump, a pipe connecting the bottoms of the cylinders with the air pump, an air-induction pipe leading from the pump to connecting pipe, an air-delivery pipe leading from the pump and termining in two branches which in turn communicate with connecting pipe, a series of controlling and air valves located in proper positions in pipes, whereby the pump is adapted to first pump air into one cylinder under the piston thereof, and subsequently pump the air so forced into the other cylinder, and then back into the first, and a check valve located in the path of the supply

pipe of the pump, for automatically permitting an increase of the initial quantity of air by fresh additions from the atmosphere with the consecutive reciprocations of the cylinder pistons, the latter in their operations forcing the air which is in front of or above them. A valve-revolving disk, slotted links connecting valve-reversing disk to valve-actuating disks, a plunger for each cylinder, link or lever connections between the plungers and valve-reversing disk, a piston for each cylinder, suitable inlet and check valves for the several pipes, an air cylinder or dash pot and valve-reversing disk.

PROCESS OF TREATING ORES CONTAINING PRECIOUS METALS.—No. 635,793; F. W. Marting and F. Stubbs, Sheffield, Eng.

The treatment of ores or tailings containing the precious metals by finely dividing the ore, mixing it with calcium carbide and moistening the mixture with water.

The Use of Vats in Place of Zinc Boxes.

The rectangular extractor box, as used for zinc shavings or a zinc couple in the precipitation of gold from cyanide solutions, has undergone practically no change, except increase in size, since its adoption by J. S. MacArthur and introduction here in 1890, says W. A. Caldecott in the Journal of the Chemical and Metallurgical Society of South Africa. As is well known to the majority of our members, it has certain mechanical disadvantages, the most obvious being the tendency of the solution passing through it to travel up the sides and particularly up the corners of the compartments, thereby forming channels. Other objections in practice are the frequent liability, from faulty construction of the boxes, of the solution to leak from one compartment to another without coming in proper contact with the zinc, and the inconveniences this leakage produces in cleaning up. I am inclined to think that imperfect precipitation has occasionally in the past been attributed to chemical considerations, or to certain constituents of the solution, when the reason has been really mechanical, or the want of proper distribution of the solution so as to ensure actual contact with the zinc. Naturally, the shape of the vessel containing the precipitating agent does not influence the chemical or electro-chemical reactions upon which the precipitation of the gold depends, but the use of small vats in place of the usual type of extractor boxes obviates the mechanical disadvantages already mentioned, and in addition these vats contain about one-half more zinc per square foot of floor space than boxes. An ordinary extractor box contains zinc shavings to the extent of 35% to 50% of its total capacity, while a zinc vat of the type referred to contains 67%. The vat is designed with the object that the path of least resistance, which the solution naturally takes, shall be through the mass of the zinc, thus ensuring proper contact, rather than between the zinc and the sides of the vat. The vats have an internal diameter of 5 feet and depth of 3 feet and may be arranged in a series of three; each vat contains about 40 cubic feet of zinc. The even distribution of the solution in the vat may be readily seen in practise from the uniform rising of the bubbles of gas to all parts of the surface. The method of introduction of the solution, the packing of the zinc between the ring and the side of the vat, the large cross-sectional area of the vat, and the absence of corners all tends to prevent the formation of channels. For convenience in cleaning up, the ring to which is fastened the sieving, is made removable. The details of construction of these vats may be considerably modified, and a little consideration shows various ways of introducing the solution at the bottom and taking it off at the top. For instance, the inflow pipe may be brought down the side of the vat or introduced from the bottom, and in place of an elbow turned square down over the center, may terminate in a ring of perforated pipe. Similarly, for convenience in cleaning up, the bottom of the vat may be made slightly conical or sloping to an outlet on one side, which delivers by a launder into a settling vat, or is connected with the pump of a filterpress. The arrangement of the side pipe line, as shown in the plan, enables one vat to be cut out at a time without shutting off the other while cleaning up or dressing the zinc, and the open T-piece allows the vat to be readily emptied of solution, and likewise prevents any accumulation of air or other gas at the angle. With a precipitation plant composed of small vats as units, ease of re-arrangement or extension to any degree required is readily apparent.

As mentioned in the S. A. *Mining Journal* of the 22nd of July last, the use of these vats was begun last month on the Witwatersrand G. M. Co., and the precipitation has since been showing excellent results. W. R. Dowling, the company's cyanide manager, has kindly furnished me with the following information on the subject. Two sets of vats, of three in each series, have been employed in the precipitation of about 200 tons per day of weak (.04%) cyanide solution by means of the lead-zinc couple, the rate of flow being one ton of solution per cubic foot of zinc per twenty-four hours. The average value of the solution entering from July 24th to August 16th was 3 dwts. and of the solution leaving 2 5 grains, so that 96.5% of the gold was precipitated. Special samples, taken on August 16th, showed the following results:

	Per ton.
Solution entering first vat	2 dwts. 20 gr.
Solution leaving first vat	10 gr.
Solution leaving second vat	5 gr.
Solution leaving third vat	4 gr.

The high efficiency of the zinc in a single vat is shown by the large proportion (85%) of the total gold in solution precipitated in the first vat, the flow through which was equivalent to three tons of solution per cubic foot of zinc per twenty-four hours, or only fifteen minutes contact. These results indicate, as is likewise shown by the appearance of the zinc, that the second and third vats only require cleaning up at comparatively long intervals.

The plant has been seen in operation by several of our members, and I am sure that should any others desire to see it at work they will be afforded every facility by the Witwatersrand Co. for doing so.

In conclusion, where zinc boxes show imperfect results from any of the mechanical causes mentioned, or where the installation or enlargement of a zinc precipitation plant is contemplated, I think that the system of using small vats in place of the ordinary type of zinc boxes is worthy, for reasons given, of serious consideration.

The Transvaal at the Paris Exposition in 1900.

Of all the foreign exhibits at the Paris Exposition of 1900, the most advanced is that of the Boers of the South African Republic. Just what effect the war between England and the Transvaal will have upon this exhibit of the Boers depends upon the result of the war. The Transvaal exhibit, if carried out, will be one of the most interesting of the exposition. The French authorities have allotted the Boers about 40,000 square feet, and this limited space President Krueger proposed to fill with novel displays from the Transvaal.

The pastoral life of the Boers, with its particular originality, will be shown under the aspect of a Boer farm, and all the rustic objects for many years and now in use. This will give in the most vivid way the life of the first colonists of the Transvaal—a lifelike portrait, picturesque, amusing and instructive.

In the National Pavilion of the Transvaal, which is built in architecture after the Holland style, President Krueger intended to display all geographical documents, also exhibits of the military administration, public instruction and the very interesting Ministry of Mines.

In the Boer farm will be exhibited wild animals of the Transvaal, which the Boers take great delight in hunting and shooting. The farmhouse will be equipped with the curious household furniture used by the Boers, such as furniture, linen, dishes and kitchen utensils. In fact, it will be a picture of home life exactly as it is seen in the Transvaal. The means and methods of transportation in the Transvaal, original, primitive and unique, will also be displayed.

In the two other Transvaal pavilions will be shown how gold is taken from the earth, how it is refined, and how the ingots are worked, chiseled or struck and transformed into jewelry or coins.

The mill building for the treatment of gold ore will be composed of two parts, between which will be installed the cyanide plant in the open air, as practiced. In one of the parts will be the apparatus for crushing the ore. A battery of five stamps will be in operation. In the other buildings will be established a workshop and a laboratory.

The driving force, in the form of electric energy, will be furnished by the large central mills established by the Superior Exposition of the Champs de Mars.

Leaving the mill of the Boers, the visitors will have access to the subterranean galleries, where will be installed mine workings for the exploitation of the two great industries of South Africa—gold and coal. The Subterranean Society of 1900, to whom has been given by the French authorities of the exposition a concession of all the ground under the Trocadero, has contracted to give space to the South African Republic for the installation of underground galleries of ore and coal, and veritable work yards exploiting gold and silver will here be established.

Among the exhibits of the Transvaal, unless the war with England destroys all their plans, will be a great variety of the products and curiosities.

The display of rough metals, such as gold, iron, silver, brass, lead, zinc, silica, tin, cobalt, diamond material and cinnabar, with the machines for extracting and working the same, will be most interesting.

Under the head of military administration, will be displayed artillery projectiles, firearms, swords, knives, a graphic representation of the forts of the Boers and legislative and statistical documents.

President Krueger appointed M. Samson Commissioner General, who commenced work on the exhibit, and has pushed it with vigor and enthusiasm ever since.

The Production of Gold.

Of the $10,000,000,000 worth of gold produced in the world since the discovery of America, more than one-half has been produced since 1860 and more than one-fourth since 1885.

These facts regarding the gold production of the world are presented by compilations of the Treasury Bureau of Statistics anent the temporary suspension of gold mining in South Africa and its possible effect upon the gold supply of the world. The compilation when summarized shows that the total of gold production from 1493 to and including the estimate for 1899 amounts to $9,833,059,600.

The following table shows the gold product by centuries and fractions of centuries from 1493 to 1860, and by decades from 1860 to the close of 1899. The estimate of the Director of the Mint for the the year 1899 was $350,000,000, and, deducting $25,000,000 for the suspension of work in the Transvaal during the closing quarter of the year, would put the 1899 production at $325,000,000. The statement of the world's gold production for the period 1493–1899 is as follows:

	Production.	*Average annual production.*
1493-1600	$ 501,640,000	$ 4,644,815
1601–1700	606,315,000	6,063,150
1701–1800	1,282,805,000	12,628,050
1801–1860	2,120,444,000	15,745,280
Decade 1861–1870	1,263,015,000	126,301,500
Decade 1871–1880	1,150,814,000	115,814,000
Decade 1881–1890	1,060,055,600	106,005,560
1891–1899	1,867,971,000	204,773,555
Total 1493–1899	$9,833,059,600	

An examination of the above table and the average for each of the periods stated indicates the rapid increase in production during recent years. During the 368 years from 1493 to and including 1860 the average annual product was $12,204,087, and during the period 1861–1899 the average annual production was $136,945,015, or more than ten times the average of the earlier period. Coming down to still later years, the period 1891–1899 shows an annual average of $204,773,555 per annum, and the single year 1899, by conservative estimates, $325,000,000.

Regarding the effect of the suspension of gold production in the Transvaal, a statement of the amount of gold produced from the mines of that country, and beside it another showing the amount produced in other parts of the world, gives an opportunity to determine the probable effect.

Removing the Chinese Wall.

It is somewhat remarkable that when China is on the eve of the introduction of Western methods of engineering she should be threatened with the demolition of the most important engineering work she possesses—namely, the Great Wall, which, stretching from the sea at the 120th degree of longitude and fringing the northern frontier of the empire to the 100th degree, stands as a monument to one of the greatest rulers China ever had. Erected two hundred years before Christ, for the purpose of keeping back the warlike Tartars, the great wall of China is older by three centuries and a half than the walls of Hadrian and Antonine, in our own country. These latter are insignificant in comparison with the Chinese work, neither of them being nearly 100 miles in length, while the engineering feat of the Emperor Shih Hwangti extends from the shores of the gulf of Pe-chi-li to the remote inland Chia-yu barrier gate, a distance of 1200 miles.

The British walls have almost disappeared, being only traceable here and there by great mounds or shapeless fragments of masonry, except at a few points which owe their preservation to the care of the archæologist. The hand of time, aided sometimes by the hands of the utilitarian builder, who has found some parts of the walls convenient quarries, has slowly but surely removed almost the whole of the work of the Roman engineers. Shih Hwangti did his work in a most substantial manner, for his wall remains to-day in almost perfect condition. The conservative tendencies of the Chinese saved it from the ravages of the builder, and it has stood for centuries, not only as a wonderful monument to human industry, and patience, but also as a symbol of the immobility of the Chinese civilization. The wall proved to be of no avail to keep off the invader, and probably its demolition may be intended to show, now that China has made a start in Western civilization, she means to make up for her stationary condition during the past 2000 years.

It is stated that an American engineer is en route to China on behalf of a syndicate of Chicago millionaires, on whose behalf he is to take a share in the expected big contract to be given out by the Chinese government for the demolition of the wall. It is further stated that one French, two British and three German firms are also bidding for the work, payment for which is to be ample in the shape of rich concessions, so that out of the ruins of the wall there may arise great engineering and industrial works which may change the whole future of China.—Engineering.

Forest Ranger System.

In the eleven States and Territories of Arizona, California, Colorado, Idaho, Montana, New Mexico, Oregon, South Dakota, Utah, Washington and Wyoming there are thirty-six forest reserves, containing an aggregate area of about 46,000,000 acres. These reserves are divided into nine districts, each having a general officer, known as a forest superintendent, in charge. Each district is divided into supervisors' districts, the number depending on the number of reserves, total area and difficulties of supervision, as affected by topography and liability to fires and depredations of all kinds. For each of these supervisors' districts there is appointed an officer called a forest supervisor, who has direct charge of the reserve or a portion of a reserve forming his district. There are thirty-nine such supervisors' districts. Each reserve is divided into patrol districts, the size of each patrol depending upon topography and the liability to fires and depredations, and a forest ranger, whose headquarters shall be at some central point in his subdivision, is appointed for each such district. There are 350 patrol districts, or rangers' subdivisions, in the thirty-six reserves. Two hundred and fifty rangers for immediate duty were authorized May 2, 1899, to serve until October 15, 1899. One hundred additional rangers were authorized to enter upon duty July 25, to serve until October 15, 1899. The rangers report to the supervisors and are under their immediate supervision. The supervisors report to the superintendents and the superintendents report to the Commissioner of the General Land Office at Washington.

The forest superintendents are directly responsible to the Commission of the General Land Office for the proper administration of the reserves. They receive from the commissioner all orders and instructions, and are required to see that they are carried out. The forest supervisor is responsible for the work pertaining to his district, and for the proper discharge of duty by the rangers, and reports to the superintendent. The respective duties of these officials are described in detail in the following:

The forest superintendents are required to post themselves thoroughly as to all the rules and regulations governing the reserve, as laid down in a general circular of instructions issued June 30, 1897, and reissued with amendments August 5, 1898, and to see that these regulations are enforced, to observe the results of their operation and to report thereon. They are to obtain information against persons violating the provisions of the forest fire law, and report it to the proper United States Attorney, and to render all necessary assistance in their prosecution. They are to give special attention to the instructions regarding forest fires and to co-operate with the supervisors in all large and important fires which are liable to get beyond the control of the supervisors and rangers, and, when necessary, to employ additional help to extinguish the fires.

They are required to study the effect of sheep grazing upon the reserves; to examine as to the question of the free use of timber and stone as provided by the regulations; timber trespasses; lands in the reserves more valuable for mineral than for timber; areas in the reserves more valuable for agricultural than for forest uses. They also have charge of the appraisement of timber to be sold, and many other similar duties. They promulgate all orders from the commissioner, and examine and pass upon all reports made to him by the supervisors and rangers.

The supervisor must have his headquarters in or near the reserve of which he is in charge. He must familiarize himself with all the conditions existing in his district, especially in regard to forest fires. He must see that notices of the forest fire Act of February 24, 1897, which are printed on cloth, are posed in conspicuous places in the reserve; that all campers, hunters and others found in the reserve are duly warned as to their camp fires and their attention called to the Fire Act. They have immediate supervision of the rangers and are required to be in and through the reserve to see that the time of the rangers is fully occupied in patrolling their districts, clearing up old trails, cutting new trails and performing their duties generally. They make weekly reports of daily service rendered and monthly reports on the general conditions existing on the reserve. They also make detailed reports to the superintendent on forest fires, showing:

First Class—The number of camp or small fires found left burning, which were afterward extinguished by the forest officers or rangers.

Second Class—The number of fires (not included in the first class) which had gained considerable headway before being located and extinguished; total area in acres burned over; number of volunteers, if any, who aided; number of extra men hired, if any, to aid; total amount paid for the extra help; amount of other extra expense incurred (not including amount paid for extra help and for tools).

Third Class—Number of large and important fires requiring extraordinary effort, time and expense to extinguish (not included in the first or second class) which were extinguished; total area in acres burned over; number of volunteers, if any, who aided; number of extra men hired to aid; total amount paid for the extra help; total amount of other extra expense (not including amount paid for extra help and for tools).

All Classes—Total amount expended during the month for tools, the dates of fires, the names and addresses of the parties responsible for their starting, the origin, the damage done, the probable market value of the timber burned and the effect upon the forest cover and water supply.

The rangers are required to be constantly on guard, to patrol their districts, to extinguish camp and other fires, to report to the supervisor all fires as indicated above, and to carry out their instructions as prescribed by a general circular dated May 12, 1899. They make monthly reports of daily service rendered, which reports are examined by the supervisors and superintendents and are then forwarded by the superintendents to the United States General Land Office.

A ranger must provide himself with horse and equipment, while the Government furnishes him with the various implements necessary to open trails in the dense forest, to construct fire barriers and to extinguish and surround fires. Each ranger is provided with a nickel badge, which is worn as an evidence of his official authority.

Arizona and New Mexico.—The superintendent of the six reserves in Arizona and New Mexico is W. H. Buntain of Santa Fe, N. M. These reserves have an aggregate area of 7,234,080 acres, consisting of, in Arizona, Grand Canyon, 1,851,520 acres; San Francisco mountains, 975,360 acres; Black Mesa, 1,658,880 acres, and Prescott, 10,240 acres; in New Mexico, Pecos river, 411,040 acres; Gila river, 2,327,040 acres.

Twenty-eight rangers were assigned to this district in May for immediate duty, and on July 15 nine additional for the Arizona reserves and five additional for the New Mexico reserves, making the total force of rangers for the superintendent's district forty-two.

The twenty-eight first assigned were distributed as follows: Grand Canyon reserve five, Prescott reserve none (the supervisor acting as ranger), San Francisco mountains eight, Pecos river five and Gila river five. The fourteen additional rangers were appointed as rangers-at-large, being assigned from time to time to such reserves as the superintendent sees fit.

Northern California.—The superintendent of the three reserves in northern California is Charles S. Newhall of Fresno, Cal. These reserves contain an aggregate area of 4,923,535 acres, and consist of the Stanislaus forest reserve, 691,200 acres; Sierra forest reserve, 4,096,000 acres, and the Lake Tahoe reserve, 136,335 acres.

There are four supervisors' districts, with W. C. Bartlett, Tallac, Cal., as supervisor of the Lake Tahoe reserve, having also the general supervision of the Stanislaus, of which last-named reserve George Langenberg is the supervisor in immediate charge, reporting to Mr. Bartlett, J. W. Dobson, Raymond, Cal., supervisor of the northern division of the Sierra reserve, and Harrison White, Visalia, Cal., supervisor of the southern division of the Sierra reserve.

Twenty-six rangers were first authorized and eight additional, on duty at large, for assignment to duty on July 15. Of those for immediate duty there were assigned to the Stanislaus four and to the Sierra reserve twenty-two.

Southern California.—The superintendent of the five southern California reserves is B. F. Allen of Los Angeles, Cal. These reserves contain an aggregate area of 3,784,594 acres, consisting of the Pine Mountain and Zaca Lake reserves, with an area of 1,644,594 acres; San Bernardino, 737,280 acres; San Gabriel, 555,520 acres; San Jacinto, 737,280 acres, and the Tabuco Canyon, 109,920 acres. They are divided into five supervisors' districts.

Forty-five rangers in May and June, and ten entering on duty July 15, were authorized.

Colorado and Utah.—The superintendent of the five reserves in Colorado and the two in Utah is W. T. S. May of Denver, Colo. These reserves have an aggregate area of 4,046,720 acres, comprising, in Colorado, the Battlement Mesa, 858,240 acres; Pike's Peak, 184,320 acres; Plum Creek, 179,200 acres; South Platte, 683,520 acres, and the White River Plateau, 1,198,080 acres; in Utah, the Fish Lake, 67,840 acres, and Uintah, 875,520 acres. This district is divided into seven supervisors' districts, each reserve constituting a district.

Sixteen rangers were assigned in June for immediate duty, and eighteen additional entered on duty July 15. Of the first-named on duty two were assigned to the Pike's Peak reserve, two to the Plum Creek, three to the South Platte, two to the Battlement Mesa, three to the White River Plateau, one to the Fish Lake and three to the Uintah.

Idaho.—The superintendent of those portions of the Bitter Root and Priest River reserves lying in Idaho is James Glendenning of Grangeville, Idaho. This area consists of about 3,997,160 acres—about 3,456,000 acres of the Bitter Root and 541,160 acres of the Priest River reserve being in this State.

There are three supervisors' districts, the Bitter Root having two. Benton Mires, Elk City, Idaho, is the supervisor for the southern part of the Bitter Root and W. D. Robbins, Grangeville, Idaho, for the north end. Robert S. Bragaw, Priest River, Idaho, is the supervisor of the Priest River.

Fifteen rangers were assigned for immediate duty: ten to the Bitter Root and five to the Priest River reserve. Eleven at large for duty from July 15 were authorized.

Montana.—The superintendent of all the reserves in Montana is J. B. Collins, Missoula, Mont. These contain an area of 5,040,000 acres, comprising that portion of the Bitter Root lying in Montana, with an area of 691,200 acres; the Flathead, 1,382,400 acres; the Lewis and Clarke, 2,926,080 acres, and the Gallatin, 40,320 acres. Each of these constitutes a supervisor's district.

Twenty-nine rangers were assigned to these reserves in June for immediate duty, eight being for the Bitter Root in Montana, nine for the Flathead, six for the Lewis and Clarke and six for the Gallatin. There were also authorized for these reserves on July 15 nine additional rangers, for assignment to duty at the discretion of the superintendent, making a total force of thirty-eight rangers.

Oregon.—The three forest reserves in Oregon—the Cascade Range reserve, area 4,492,800 acres; the Bull Run, area 142,080 acres, and the Ashland, area 18,560 acres, or an aggregate area of 4,653,440 acres—constitute a superintendent's district, of which S. B. Ormsby, Salem, Or., is the superintendent.

There are three supervisors' districts, the northern division of the Cascade Range reserve and the Bull Run being under the supervision of W. H. Dufur, Dufur, Or.; the central division of the Cascade Range forming another supervisor's district, under Ralph B. Dixon of Roseburg, and the southern division of the Ashland another, in charge of Nat Langell, Jacksonville.

Forty rangers were assigned for the entire season—thirty-seven for the Cascade Range, two for the Bull Run and one for the Ashland.

South Dakota and Wyoming.—The Black Hills reserve in South Dakota and Wyoming, the Teton, the Yellowstone National Park timber land reserve and the Big Horn reserve make a district, of which C. W. Carbutt, Sheridan, Wyo., is the superintendent. The total area of these reserves is 4,407,840 acres, the Black Hills in South Dakota having 1,166,080 acres, and in Wyoming 45,600 acres; the Teton, 829,440 acres; the Yellowstone, 1,239,040, and the Big Horn 1,127,680 acres. There are four supervisors' districts.

Washington.—The superintendent of the reserves in Washington is D. B. Sheller, Tacoma, Wash. These contain an aggregate area of 8,121,880 acres, comprising that part of the Priest River reserve which lies in this State, area 103,960 acres; the Washington, 3,594,240 acres; the Olympic, 2,188,800 acres, and the Mount Rainier, 2,234,880 acres.

The Washington and Priest River form a supervisor's district, of which Edward Burin, Custer, Wash., is the supervisor; F. C. Matheson of Shelton is the supervisor for the Olympic, and George McCoy of Napavine for the Mount Rainier.

Twenty-three rangers—eight for the Washington, six for the Olympic and nine for the Mount Rainier—were authorized for immediate duty, and for duty on July 15 eleven more as rangers-at-large.

Only persons physically, as well as otherwise, qualified are selected for the position of ranger. Old age, indolence, weakness and intemperance are disqualifications which, when made known to the department, will lead at once to the dismissal of the objectionable ranger. These officers are the sentinels in the forest, and absence from their post of duty is not permissible. This regulation guarantees constant vigilance in the hour of fire peril or timber depredation.

In recent years a considerable quantity of manganese ore for use in the steel-making industry has been imported into the United States from Chili. The mines in the Carrizal district have been worked only a few years, but the ore is considered to be superior in quality to that found in other parts of the country. Recently it was announced that 25,000 tons of Chilian ore were contracted for to be delivered at Philadelphia. At a point thirty miles south of Serena, the capital of the province of Coquimbo, at an elevation of 1431 metres, it is stated that there are forty manganese mines within a radius of five miles. These mines are twenty miles from the railway at Angostura and forty miles from Coquimbo. No blasting is required. The only implement for mining is the crowbar.—Modern Machinery.

Indiana wire nail companies have made a contract with a Knightstown, Indiana, man to revive gas wells. He reports having brought in two big flows from abandoned wells, and claims to have demonstrated that the old wells are not worthless. He uses a chemical which, lowered to the bottom of the well, eats its way through the Trenton rock, dissolving and cleaning out a cement which had formed in the pores and clogs the way for the gas to pass to the well. Another charge is put down with nitroglycerine on top and shot into the rock. It is claimed the revived wells are as good as new.

Notes on Mine Surface Sampling.*

NUMBER II.—CONCLUDED.

Written by S. H. PEARCE.

Pulp Leaving Mill.—This is usually sampled, either by the automatic sampler, or by hand sampling. The latter operation consists of passing a cup, or other suitable vessel, along the stream flowing from the bottom of the plates. In some mills an arrangement of mercury traps prevents its being taken at all; in many others the space is not sufficient to allow of a large enough cup being used, in which case the cup overflows, and the sample is concentrated. There is also the danger of the cup touching the edge of the plate, where there is always amalgam present, the least fragment of which renders the whole day's sampling of no value.

This sample, under proper conditions, is a very good one, and I should always recommend its adoption as a check upon other methods.

The automatic sampler consists of a mechanical contrivance for taking a section of the pulp stream, by means of a slotted pipe, which is mechanically passed twice through the stream at each operation; for its motive power and automatic action it depends upon a supply of water, which gradually fills up a small receptacle; this, upon reaching a certain height, changes the center of gravity, overbalances, tips out the water and returns to its original position; the amount of water supplied regulating the intervals of tipping.

The two main imperfections are: that a pipe being used, there must be considerable disturbance caused in the stream when passing through it, and, therefore, the sample is affected; the other is that the position of the slot is necessarily movable, which is a drawback, inasmuch as it can be so arranged as to take almost any proportion of either pyrites, sands or slimes at will.

The wet pulp sample, when collected from the sample box, which is usually performed by first running off the clear water by means of plugs in the side of the box, and shoveling it all out into a bucket, is by no means an easy thing to deal with. The only really satisfactory way is to dry the whole sample and pass through a sieve before quartering down.

In a few cases, where the circumstances warrant, a bucket may be used, and the surplus clear water be allowed to overflow, and in such cases the pulp settles in hard layers and the water may be poured off without carrying any appreciable amount of slime. If this is the case, time and trouble may be saved by sampling the buckets with a small rod, which is made slightly smaller at the end, only great care must be taken that clean sections are obtained and nothing is left at the bottom of the hole.

Spitzlutten Concentrates.—This material is an unsatisfactory subject to handle, and one is apt to be much puzzled at the erratic results obtained at times, but it should be remembered that the object of the spitzlutte is to separate from the bulk of the mill pulp a proportion to which it is advisable to give a longer period of treatment; the material so obtained will therefore consist of coarse particles and include amalgam, etc., which has passed the traps designed to catch the same. This is one of the chief reasons why sometimes an assay of 30 dwts. is obtained where less than half that amount per ton would represent the actual value of the charge.

The only way that I am aware of that will give anything like consistent results is to take a measured quantity, say, a bucketful, of water and concentrates, every hour or like period, and collecting in a common receptacle for reduction at the end of the charge, or the twenty-four hours, as desired.

Where more than one spitzlutte is used, which is generally the case, it is of no use to take some from each, as the value of each is different, and a proper proportion cannot be obtained. The whole stream should be led into one launder, at the end of which the sample should be taken. In cases where it is not convenient to adopt a permanent arrangement, a temporary launder should be used. Silting in the launders is apt to cause concentration, and coming away irregularly seriously affects the sample.

Beyond this, the main thing is to see that the spitzlutten are working regularly and, as nearly as possible, under the same conditions always; the water supply sometimes varies and other things require attention, and I think it well to note here that it is not a good thing to regulate the concentrators first and then take the sample, or the result will be that the sample will not be what is actually in the tanks, but, rather, what ought to be obtained.

The same advice in regard to all irregularly constituted material will apply here, viz: To take as big a sample as you conveniently can, and not too quarter down too far before drying. It is advisable afterwards to grind to a 60-mesh sieve for the latter stages, as the particles are usually coarse, and the results are otherwise liable to be erratic.

Sands Originals (Hose Filled).—In the case of double-storied tanks, this is a difficult subject to sample, as in the upper or collecting tanks it is deposited unevenly, either horizontally or vertically, or in any other direction. Vertically, it differs according to the value of the rock milled; horizontally, it has a higher value in the center, and decreases with more or less regularity towards the edges of the tank, according to the method of filling adopted. The variation may be from 5 dwts. or more in the center, to 8 dwts. or less at the sides, even in a well-filled tank, and for these reasons I do not at present see how any system can be efficient.

Samples from the hose are too high, owing to a large amount of slime leaving the tank.

Cutting sections from the sides of the holes made to lower the tank is about as satisfactory as any of an unsatisfactory lot.

Rod sampling, generally, is not satisfactory, as there is a tendency for the rod to get choked up with the first few inches driven, and after that you drive down a solid rod, the bottom not being sampled at all. In the case of a closely packed mass like a hose-filled tank, this may be overcome to a great extent by taking sections of about a foot at a time; as far, however, as sampling the whole tank is concerned, this will not help you much. It is simpler to calculate from the automatic samplers, as is the present general practice.

Sands Residues.—With these we have an opportunity of sampling each truck on its way to the dump; even here we are not free from difficulty. To-day, owing to better precipitation, there is not the same need for care in the matter of draining out of gold-bearing solution, which, in many cases, by giving too low a result, was a cause of discrepancy.

In quartering down, the whole sample should be passed through a ¼-inch sieve, so that the whole can be more intimately mixed before reducing.

Slimes.—This material, on account of its uniform character, presents the least difficulty of all. Sometimes there are some sands associated, but which, with ordinary care, should give no trouble. The automatic sampler gives excellent results in any case.

In collecting this sample some care must be used in running off the supernatent water, after which it should be bailed or otherwise transferred to a bucket, seeing that nothing is left behind; here, if sufficiently thick, it can be mixed up by hand and a portion taken for assay; if preferred, a dividing funnel may be used, which is better if the pulp is very thin, or there is much sand present.

Slimes Residues.—For this material there are two methods in use: 1. From the tanks. 2. From the end of the discharge pipe.

In regard to the first one, it should be borne in mind that the residues are homogeneous, horizontally, but not vertically, and that this same requires care to obtain by any method a proper proportion of the whole. The advantage of this way is that there is less moisture, or gold-bearing solution, and therefore it is easier to handle subsequently. The disadvantages come in when the depth of charge is very great, or the tank is for any reason not well settled, in which case there is a tendency to get an undue proportion of solution, which should carry most of the gold.

One of the most important things to remember is care and regularity and cleanliness above all things.

*Condensed from Journal Chemical and Metallurgical Society of South Africa.

California at the Paris Exposition.

The mines and minerals of the State of California will be well represented at the Paris Exposition in 1900. The California Paris Exposition Commission has recently made a large shipment of minerals for the Exposition. Some of these were selected from the State Mining Bureau and the remainder is made up of collections from a number of the producing mines in the State. Another shipment of minerals and ore samples will be made at a later day, including several models of different mines, mine timbering and mining methods. A modern California quartz mill, with all its appliances, rock breaker, grizzlies, ore bin, concentrator, dynamo, etc., made to one-tenth scale, is being constructed by the California Paris Exposition Commission and will also be shown. Among the contents of the mineral exhibit is a large number of specimens, very rich in free gold, and also gold with sulphides of copper, iron, lead and telluride. An extensive display of silver, copper, lead and zinc ores is now in preparation. Illustrations of the different methods of gold mining in California will be made, and in this department a fine collection of photographs of mines will be found. Special space has been obtained for showcases, in which gold specimens are to be exhibited, and it will be the effort of the commission to secure as many valuable gold specimens as can be obtained during the next two months. Absolute insurance against loss is guaranteed to public-spirited and liberal mining men who have kindly loaned their most valuable specimens to swell this particular exhibit. A large collection of economic minerals, such as clay, slates, sandstones, marbles and other building materials, has also been made. The special exhibits of such minerals as are rarely found in the United States except in California, such as chromite, quicksilver, magnesite, bituminous rock, asphaltum, mineral oils, borax, soda, etc., will occupy a prominent place. A much larger space has recently been obtained from the United States Commissioners, which will enable us to make a much larger and better exhibit than was first anticipated. The commission has spacious offices in the prominent business center of Paris, where a fine collective exhibit of California's resources, industries, products and arts will be tastefully displayed. A. Ekman has charge of the mining department, and will go to Paris about March 1st, 1900. His present headquarters are at the California State Mining Bureau, Union Depot, San Francisco.

Don't.

Regretfully is noticed an apparent spirit of hostility to the larger city in several Western commonwealths. Among the 300 or 400 clever journals daily received are many caustic references to what is said and done in the metropolis, evincing a spirit of carping criticism, a cynical misjudging of motives that is not good for anything. Especially is this the case when reference is ordinarily made to the metropolitan press. The papers that happen to be published in the metropolis are charged with a great many sins of omission and commission and share with the citizens of the larger city in the general denunciation by a portion of the press published in less populous communities. This paper is an exception. Acknowledgement is here made of the universal kindliness of reference to this paper, and the courtesy is sincerely appreciated and heartily reciprocated. It is just because of this friendly feeling and mutual good will that this paper in all kindness ventures to suggest to some of its colleagues and coworkers in so many newspaper offices in this west half of America that it is not wise nor fair to say so many cutting things about the motives and intentions, the deed or misdeeds of the press or public happening to be resident in the metropolis. Not that such opportunity does not constantly arise; not that the metropolitan press and public are not abundantly able to take care of themselves; but because it is not business. There is nothing so cheap as a sneer, nothing so easy as to misjudge good intention and ascribe wrong motives; nothing so hard as to bridge over the rifts made by hard words. The city and the country are interdependent; one is the complement of the other; their fortunes rise and fall together, and it is bad for any commonwealth that does not realize this.

In California it is long the fashion for the interior press to "roast" San Francisco. San Francisco can do nothing good; if it, unaided and unostentatiously, raises $60,000 to welcome returning soldiers without asking a cent outside, and from motives of the purest patriotism, at once the cry goes up, "'Tis an advertising scheme; how hoggish is that town!" If a wealthy San Franciscan gives a public endowment in life, his generosity is travestied as a bid for popularity, and the inquiry is made, "What office is he after?" The same in Denver. The citizens of Colorado's metropolis have with great expense furnished the fine spectacle of the Mountain and Plain Festival, an enterprise of great value to Colorado, but from the bitter tone of some of the Colorado papers it would seem as though the idea prevailed that Denver was "cinching" the entire State, and that the whole splendid scheme was a sort of swindling game for Denver's sole benefit. Recently a Denver man bequeathed a million dollars to a worthy public benefit, and the comment of a portion of the interior press was to the effect that he was a fool. So in Portland, Oregon, and elsewhere.

It is needless to discuss the "why." The idea is to kindly suggest that such things are hurtful, that they are boomerangs. Because they are not usually noticed by city publications makes them none the less hurtful.

When people continue saying mean things about others they get to believing those statements themselves after awhile, and that, of itself, is a bad thing for the general good, which every one is supposed to foster.

Running a Blast Furnace.

Few people who have not actually run a blast furnace realize what it is to fill the capacious maw of one of those monsters. A stack of 200 tons daily capacity, running on 50% ore, must have delivered to it each day something more than 400 tons of ore, 250 to 300 tons of coke, and over 100 tons of limestone, besides sand, coal and minor supplies—say, 900 tons of raw materials. Add the 200 tons of pig iron product shipped out and we have a daily freight movement of 1100 tons, taking no note of the disposition of the slag. The mining of the ore requires the labor of 150 to 300 men; the coal mining, coke making, quarrying of limestone and transportation, at least 300 more. The furnace itself employs about 150 or more hands. Starting up a furnace of ordinary capacity, therefore, calls immediately for the labor of nearly 1000 men; for the use of at least 1000 railway cars and many locomotives; for perhaps several steamers and vessels on the lakes; for capital, from the mines to the pig iron, of one to two millions of dollars, and last, but not least, for a high order of managing ability.—Engineering Magazine.

Belt Conveyors.

A 48-page pamphlet and catalogue bearing this title has just been issued by the Robins Conveying Belt Company, 147 Cedar street, New York, and, as it is the first illustrated and complete description of the system which has come to notice, a few extracts from it will be of interest to those engaged in the mechanical handling of material:

The construction of the belt and idlers is shown in cuts Figs. 1 and 2. The dark portions of the belt are

FIG. 1.

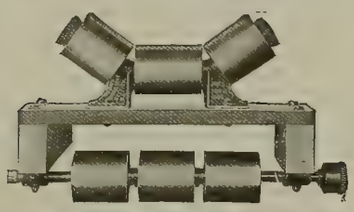


FIG. 2.

of rubber and the light of cotton duck. The heavy reinforcement of rubber in the center where the load is carried enables the belt to withstand abrasion, which would destroy an ordinary belt very quickly, and also makes the belt pliable enough to conform readily to the troughed idlers. These are lubricated by grease cups through hollow shafting, being thus rendered dust proof. These, as well as the take-ups, pillow blocks and all the other component parts of the Robins system, have been standardized and belt conveyors have been raised to the rank of finished machines, adapted to all the varying propositions in which conveying machinery is required. The illustrations here given show four of the most typical uses of belt conveyors.

Fig. 3 shows a conveyor at work carrying dredgings of rock, gravel and mud from a dredger to the river bank. The dredger is engaged in widening the Danube below Vienna, and the work required a conveyor with a capacity of 1200 tons per hour. The belt conveyor is stated by the manufacturers to be the only machine which could handle such an amount of material. The belt is reported to be still in good condition after two years of most arduous service.

FIG. 3.

Fig. 4 shows the belt conveyor used in place of a sorting table at the Sterling Iron & Zinc Co., Franklin, N. J. This is a service for which it is especially adapted. There are no teeth or links to wear or get out of pitch, nor bearings exposed to dust or grit, nor any crevices where a piece of ore can stick or jam. The belt, on account of its elasticity, will stand for several years an amount of pounding, hammering and abuse that would in a few weeks destroy a machine more rigidly constructed. For this work a wide, heavy belt is used, with idlers so shaped as to give the belt a broad, flat surface at the center, and narrow, very slightly raised sides.

FIG. 4.

Fig. 5 shows another adaption of the belt conveyor,

FIG. 5.

used to carry the ore from the crusher at a slight incline, where it obviates the necessity for using vertical elevators in crushing or milling, and, by making it possible for all the machinery to rest upon the solid ground, renders later extensions of the plant easy and inexpensive. Little power is required to run these conveyors.

Fig. 6 illustrates the Robins patent tripper in operation. By this device the belt is enabled to empty its load at fixed or movable points along its length, its position being changed either by hand or automatically. In the latter case the tripper may be made to move back and forth along the line of the belt, reversing itself at either end and distributing its load as it goes. The tripper is principally used in storing material in piles or in bins.

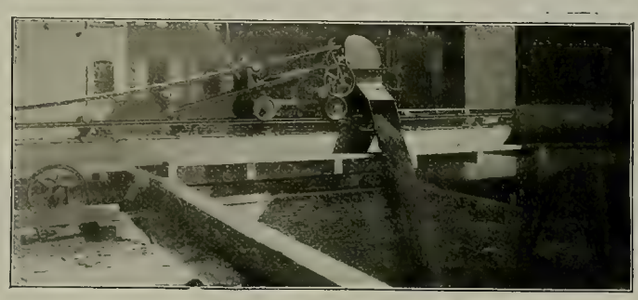

FIG. 6.

Filtration of Cyanide Solutions.

The recovery of gold from cyanide solutions is accomplished in a variety of ways. That most commonly employed is the precipitation of the gold upon zinc shavings or by the introduction of zinc powder into the gold solution. The employment of charcoal filters, while known to accomplish the desired result, is not in use except to a very limited extent. One of the new processes for the recovery of gold from cyanide is the Webb process, in which the results are obtained by arranging or building a filter with a series of cells or compartments of any size desired, filled alternately with carbon and zinc, and through these compartments the solution is caused to pass downward through the carbon and upward through the zinc. The carbon may be in the form of either coke or charcoal, and the zinc should be in a finely divided state. These compartments, when thus filled or charged, become positive and negative cells, and when flooded and connected with such a conductor as a solution of cyanide of potassium containing precious metals they generate an active electrical current and hasten the precipitation of the precious metals held in the solution, the values being deposited in or precipitated upon the carbon. To attain this object the solution is made to flow downward through the carbon in order that as much as possible of the precious metals contained shall be deposited by filtration in or upon the upper layers of the carbon, and this object is further assisted by introducing a small perforated pipe into each zinc compartment, through which at intervals a strong current of compressed air is turned. This volume of air, rising and bursting upward through the zinc, clears it of the brown powder-like deposit of precious metal precipitated upon it, forcing the deposit upward and carrying it over with the upward flow of the solution upon and into the carbon, where it is caught and held, and thus by filtration and forcing of the precipitates of the zinc upon it the upper layers of the carbon receive and soon become heavily filled with the precious metals. This richer upper portion of the carbon can be taken off from time to time for burning and smelting, and only at long intervals will a general cleanup be necessary. The air pipe in the carbon compartments is used to keep the filter free from clogging by forcing the deposits and fine particles of carbon to the top, and it is also used when cleaning up to drive the solution out of the carbon. The decomposed zinc, with smaller proportion of the precipitated values, is deposited in the bottom of the zinc compartments, from whence it is taken out and treated in the usual method where zinc alone is used.

Cyanide Poisoning.

The liability of those employed in cyanide works to poisoning by cyanide solutions or by hydrocyanic gas makes the following from the Journal of the Chemical and Metallurgical Society of South Africa of interest:

An important consideration in connection with Mr. Johnston's paper is whether peroxide of hydrogen is as good an antidote for hydrocyanic gas as for the potassium cyanide solution. The dangers of poisoning from gas are as great as from the drinking of solution. From the few experiments I have tried it seems that hydrogen peroxide (H_2O_2) is as efficacious for one as for the other. I might add my small testimony to the success of this antidote by saying that on this mine a kaffir who swallowed a fatal dose was saved by an injection of the peroxide, and was at work again in a few days.

The instability of the peroxide of hydrogen seems to mitigate its usefulness. I do not know whether it has yet been tried, but I should think that ozonic ether would prove even better than peroxide of hydrogen, for it is much more stable than the peroxide, and consequently more to be depended on.

It might be well to mention in connection with Mr. Johnston's paper that there is another danger from poisoning in the cyanide works which should not be overlooked, and that is the danger of having arsenic in the zinc, or ore, with the formation of the deadly arseniuretted hydrogen. LANE CARTER.

The above seems to be another proof of the efficacy of H_2O_2 as an antidote for cyanide poisoning. It was to be expected that H_2O_2 would prove useful in cases of poisoning by gaseous hydrocyanic acid, where any other antidote administered *per os* (*e g.*, ferrous and ferric salts and cobalt nitrate) and calculated to produce non-poisonous compounds in the stomach will be found useless. The superiority of H_2O_2 lies in the fact that it will act as an effective antidote even after the hydrocyanic gas (HCN)—whether inhaled directly or produced in the stomach from KCy—has entered the blood. It cannot be too strongly pointed out that, as a rule, KCy is rapidly decomposed by the acidity of the stomach, and the HCN thus liberated enters the blood so quickly that any antidote administered with a view to counteract the poison in the stomach itself will, in the majority of cases, prove unsuccessful. Hence the superiority of subcutaneous injection of H_2O_2, which will counteract the free hydrocyanic acid in the blood by preventing the formation of cyanide-hæmoglobine. Professor Kobert, in a letter to me, expresses the opinion "that in view of the numerous proofs, both experimentally and in practical life, brought forward for the efficacy of H_2O_2 in cyanide poisoning, he considers any fresh experiments on animals as unnecessary cruelty." The difficulty which, as Mr. Carter points out, exists in the instability of H_2O_2 will be shortly overcome, as I am informed that a local wholesale firm has ordered complete sets of apparatus for the injection of H_2O_2, containing hermetically sealed sterilized tubes with a solution of H_2O_2 ready for use, and the necessary implements for injection. J. LOEVY.

THE discovery of beach sand placers in Alaska is announced from several places. The success attending this class of mining at Cape Nome has stimulated prospecting for these deposits.

Mining Summary.

ALASKA.

The steamer Cottage City has arrived at Seattle, Wash , from Alaska with 193 passengers and $25,000 in gold. Several of her passengers were from the interior, among them being U. S. Consul McCook.

A telegram from Dawson reports mild weather in the Yukon basin. On Oct. 31st it was 30° above zero at Dawson.

A large rock fell from the mountain on the White Pass Railroad on Nov. 1st, carrying with it smaller rocks. C. Johnson and J. McLaughlin were seriously injured.

The latest "stampede" is to Cape York, in the Cape Prince of Wales district, about 100 miles north of Cape Nome. The usual "fabulously rich strike" is reported from the Siberian side, and people are reported "rushing" from Cape Nome and St. Michael in that direction.

Juneau *Record*: The Alaska-Juneau mine in Silver Bow basin has been closed down for the season of '99 after a successful season. This mine is under the management of A. Nivens and has two mills, one of thirty and the other of five stamps. This company has a payroll of $25,000 a month during the summer, which does not include the cost of transporting the concentrates four miles to Juneau for shipment to the smelter. Owing to a late summer work was not begun this year till May 1st, and the officials are now figuring on improvements and enlarging the plant for next summer's work. The ore produced is said to be the best from any of the low-grade propositions near Juneau.——Foreman Boyle of the Nowell Co.'s hydraulic mines in Silver Bow basin, reports that the water is still sufficient to operate the giants, and that his company expects to get a good head of water until November 15th. This has been one of the most successful seasons in the history of hydraulic mining in that locality, notwithstanding the fact that the season was late.

Juneau *Miner*: W. Zimmer and E. A. Klatt have located quartz claims on the east shore of Lynn canal between Dyea and Skaguay. The properties are accessible to deep water. Two men are doing development work. Assay returns give gold $3.40, silver $45.75, copper $6. The rock also carries some lead. The ledge has been traced 500 feet. Three claims have been located.

ARIZONA.

(Special Correspondence).—Geo. P. Harrington, former Supt. Crowned King mine, is pushing work vigorously on the old Tiger mill and expects soon to be pounding out gold bullion.

The old Peck Camp is again coming to the front. Copper deposits are being systematically opened up.

The Big Bug smelter, under H. B. Clifford, Mgr., is producing copper matte. D. G. Jewett is metallurgist.

Mayer, Nov. 3rd, '99.

GILA COUNTY.

The Old Dominion Co. at Globe has averted a shut down by buying a large amount of coke from the United Globe Co.

Globe *Silver Belt*: Prof. J. Douglas, who is at the head of Phelps, Dodge & Co.'s mining interests, says that the suspension of work by the United Globe Co. is temporary, made necessary by the introduction of a new furnace of 250 tons capacity and a pump of large capacity in the Hoosier shaft. These additions will consume six or eight weeks, and as a consequence operations will be suspended until the first of the year. The company has a good mine in the Gray, adjoining and connected with the Hoosier.

MOJAVE COUNTY.

Kingman *Miner*: The Midnight mine, at Chloride, owned by Keene St. Charles, has cut a large vein of shipping ore.——On the 400 level of the Tennessee mine a body of native silver ore has been struck. The old ore body is still intact.

Needles *Eye*: R. J. Dyas, who has large interests in the copper mines at Empire Flat, has sent a large barge loaded with mining supplies down the Colorado river to the mine. After discharging its cargo at the mines, the barge will be loaded with ore and towed up the river to Mellon, from which point the ore will be shipped by rail to the smelter.

PIMA COUNTY.

The discovery of molybdenite in the Santa Rita mountains is reported. The vein is 5 feet wide and contains 15% of the mineral.

YAVAPAI COUNTY.

It is reported that five shares of United Verde stock changed ownership in New York recently at $300 a share. The par value of United Verde is $10, and there are 300,000 shares. At $300 a share, the stock is worth $90,000,000. Dividends are being paid at the rate of 3% a month.

The laboratory and assay office of the Valverde Copper Co. at their new smelter at Agua Frio were destroyed by fire on the 6th inst.

There are numerous veins about the headwaters of the Hassayampa creek that contain copper sulphides with good values in gold and silver.

Journal-Miner: H. A. Kendall of Prescott is said to have recently bonded twenty-five claims owned by him in the vicinity of Jerome for $220,000.——A. J. Doran, Supt. Montgomery M. Co., which recently purchased the Accidental mine on Lynx creek, near Prescott, reports that a stamp mill will be built. Five stamps will be put in at present, but power will be provided for a larger number, and the mill will be arranged that additional stamps may be added.

Courier: Rich silver ore has been found twelve miles south of Jerome. The ore carries 400 ounces per ton silver and 35% lead. The ledge ranges from 6 inches to 2 feet in width. The property is owned by J. W. Hudgens, T. F. Peters and W. T. Hall. Mr. Hall is the manager of the McCabe mine, near the Agua Frio.

YUMA COUNTY.

It is reported that W. D. Luce will build a custom smelter in Yuma.

Natural gas has been discovered issuing from the mud in the bed of the Colorado river at Yuma.

CALIFORNIA.

Amador.

The new vertical shaft of the Mutual mine, near Sutter Creek, is 300 feet east of the ledge and down 200 feet. Stringers of quartz are being encountered. At the 500 level a station will be cut and crosscutting for the ledge begin.

The new east shaft of the Kennedy mine, near Jackson, is down near 800 feet, and sinking at the rate of 22 feet a week. This is above the average, and, with the exception of the new Utica shaft, which went down the first 1000 feet at the rate of 30 feet a week, beats the record in Amador. At the 2500 level stoping will begin.

At the South Eureka mine, near Sutter Creek, sinking continues. The shaft is down 1700 feet.

The Central Eureka is producing rich rock estimated at over $100 per ton. At the 1500 level drifting both ways on the lead is in progress. Sinking is in progress, good rock being found in both shaft and drifts.

The old village of New Chicago is again building up about the Fremont Con. mine north of Amador City.

Jackson *Dispatch*: O. M Watkins is about to open up a gravel mine near Volcano. He is also operating the Yellow Jacket, near the Defender mine in Pioneer district.——Supt. Thornton of the Shenandoah mine, near Plymouth, is preparing to sink the shaft 200 feet deeper. The north drift at the 200 level will be continued to the end line. The rock is still rich.— A shipment of bullion from the Argonaut mine, amounting to $25,000, was made on the 3rd inst.——Reports from Dr. A. L. Adams' mine, Mt. Echo district, near Ione, say he is still taking out gold in quantities.

Jackson *Ledger*: At a recent meeting of the Peerless Gold Mine Development Co , E. Ginocchio of Jackson was elected president. Lumber for the construction of buildings, etc., has been ordered. The company is looking for suitable machinery for the mine.—— The Lincoln mine, at Sutter Creek, is said to be improving. E. H. Voorheis, Supt. of the property, has been driving a crosscut west for some months, and two weeks ago he found a ledge of gold-bearing ore, which is from 10 to 12 feet wide, and will mill $10 per ton.—— The Jackson Butte M. Co. has resumed work on its mine south of Butte mountain, after a shut down of several months, under R. L. Marsh, Supt.——The Crown Point mine, at Butte City, has been rebonded to an Eastern company by the owner, T. Mello. One-half of the purchase price has been paid.——The milling of ore from the Central Eureka, near Sutter Creek, continues at the Zeila mill at Jackson.

Butte.

Oroville *Mercury*: The McLain mine, a mile from Cherokee and the same distance from Pentz, commenced operations a few weeks ago. It is known that considerable gold from the Cherokee mine escaped with the tailings. To work the tailings Mr. McLain has an elevator constructed of 11-inch pipe, similar to the Martin elevator, which, by means of a telescope joint and several ball joints, may be sunk as occasion requires. The gravel is ground-sluiced to the elevator, and is by it conveyed to the flume, which is 4 feet wide, 1½ feet deep and 160 feet long, and empties into another flume, 12 feet wide and 36 feet long, which is set at an angle to the smaller flume, to break the force of the current and to prevent the loss of gold. It requires about 400 inches of water to operate the mine, which is conveyed in half a mile of 15 inch pipe and two miles of ditch. The mine is run continuously night and day. Eight men are employed in the day and the same number at night. B. G. McLain is Supt.

Calaveras.

Vigorous prospecting is in progress in the Ford mine at San Andreas in search of a pay shoot. Large bodies of low-grade quartz have been developed and some very rich gold and telluride ore found at various portions of the mine. The company have recently bought sixty acres of land adjoining their property for $4500.

San Andreas *Prospect*: Mining operations ceased in the Stickle shaft of the Utica works this week, and the retimbering of the shaft is in progress. The old timbers, it is said, contain considerable gold from the ores which they supported, and they are being burned and the ashes panned. The air compressor to furnish the power for hoisting, and which will be run by electric power, is finished.

San Andreas *Citizen*: The Demarest G. M. Co. have bought the Murphy property, adjoining the Demarest, on which they had a bond. The winze on the 400 level is yielding rich ore on which the mill is running.——The Ellen Vannan gravel mine, six miles from San Andreas, on the Mokelumne Hill road, is the scene of great activity now. A new pipe line has been added, increasing the supply of water. Bedrock was struck and they are drifting for the east rim of the channel. They have pay on the west side and the waste from the east drift is run through the mill, four of the eight stamps being used,——The new owners of the Shirley Queen mine, on the Oxendine ranch, near Copperopolis, are working the 5-stamp mill to its fullest capacity and are preparing to put on a larger force and increase the milling capacity.——The Anderson mine, near the Martin mine, at Sheep Ranch, is to be reopened by S. Thomas and son of Oakland, W. Willoughby of Grass Valley and T. Treverow of San Francisco. There is an old shaft on the Anderson which it is proposed to sink deeper.——The new owners of the Lucas mine, on the Mokelumne river, opposite the Standard Electric Co.'s power house, have begun sinking a vertical, double-compartment shaft on top of the hill, which is calculated to strike the lead at 320 feet. They are putting in two wheels, one to run the hoist and the other the 10-stamp mill.——Gove and Child of Lodi, and Mr. Titus of Oakland, have bought the Siffre gravel mine, on the point of Stockton ridge, near Mokelumne hill.——At the Esperanza mine, near Mokelumne hill, they have received 1600 feet of new cable and are ready to start up.——The Green Mountain mine has completed a new ditch, giving them 800 inches of water and an additional pressure of 50 feet.——On the Vorlander, of which Mr. Burleson is Supt., a pump has been installed. It is operated by water and throws 3000 gallons an hour. The shaft is now down 160 feet and a contract has been let to sink an additional 100 feet at $20 a foot.

Angels *Echo*: Preparations are being made at the Welch mine, near Copperopolis, for building a mill. The vein is 40 feet in width.

Del Norte.

Crescent City *Record*: Reports from the Blue Ledge copper mines, owned by Del Norte parties, are that the vein has been tapped at a depth of 146 feet and the ore found is rich in copper. The mine is in the Siskiyous, eighteen miles from Jacksonville, Or.

El Dorado.

Work on the Stillwaggon mine at Omo will be resumed.

Several men are driving a tunnel on the Coleman mine at Omo to prospect for gravel.

The force at the Mt. Pleasant mine, Grizzly Flat, is being increased.

The Spreckels & Mulkey mine at Cedar Grove has closed down.

The Big Canyon mine at Canyon, four miles southeast of Shingle Springs, which has been idle for several months, will be started up in a few days. E. Kane, formerly Supt. Ford mine at San Andreas, will have charge. The mine is owned by Hayward & Lane.

Placerville *Democrat*: The Melton mine at Poverty Point was started up Monday under lease to a local company, of which J. Fuller is foreman.

Georgetown *Gazette*: T. M. Davis, of Greenwood, has made a strike while doing development work on his claim, north of the Argonaut mine, where he uncovered a pocket in the ledge. A single pan yielded over $300. The ledge is 3 to 4 feet wide.

Placerville *Nugget*: The Blue Gouge mine is running full blast under the management of Supt. Bind. Thirty men are employed. The ditch is nearly completed. When the grading for the mill is finished they will then put up four Huntington mills.

Georgetown *Gazette*: At the copper mine near Pilot Hill a number of men are employed putting up buildings and opening the mine. It is claimed that the ore goes 20% copper and $15 per ton gold.

Los Angeles.

The Los Angeles county courts have enjoined placer miners operating in the San Gabriel canyon, in that county. The mines in this canyon have been worked for many years and the water used for mining without complaint or hindrance, as the water after use flows back into the main channel and is used in the San Gabriel valley for irrigation. The party contesting the miners is the Electric Power Co.

Nevada.

Sutter Creek *Record*: At the Massachusetts Hill mine, near Grass Valley, they are putting in a plant to use petroleum fuel. Such a plant has been in operation for more than two years at the Maltman chlorination works, near Nevada City. Stone coal is being used at the Massachusetts Hill mine and Supt. Foote says that is cheaper than wood.

Orange.

After a trial of several months the quicksilver deposits near Santa Ana have been abandoned. A little very good ore, mostly metacinnabarite, was found, but the value was too much scattered to make mining profitable.

Placer.

(Special Correspondence).—Three-fourths of the stock of the Morning Star M. Co. has been transferred. On the 6th inst. 1803 shares of stock in that mine were bought by H. T. Power, D. W. Lubeck, J. McAninch, Mrs. I. M. Power, Mrs. D. T. Briggs and H. E. Yardley. H. T. Power was elected Pres. and Supt., vice J. H. Neff, resigned. The total number of shares in the company is 2400. The gravel channel in the Morning Star having turned in the direction of the Big Dipper mine adjoining, the Morning Star would be forced to discontinue its operations. There is still considerable gravel left in the old company's ground. The Morning Star mine has been worked for many years and employs forty men. The gravel has averaged from $7.50 to $10 per ton for the 2000 feet of channel which have been worked. The output of the Morning Star is $1000 a day.

Colfax, Nov. 8th, '99.

The Mammoth Bar mine, near Auburn, has been shut down owing to a rise in the river.

Auburn *Herald*: The Grass Ravine Co. of Ophir is running 150 tons of ore at the St. Lawrence mill, a test of fifty tons having proved satisfactory.——It is the intention of the Bellevue-Bullion Co., near Ophir, to work the two mines through the shaft of the Bullion. They have put up a 36-foot wheel at the latter, which gives them hoisting power. Sinking the Bullion shaft will be continued to 500 feet. Levels will be run and connection made between the two shafts at what is now the foot of the Bellevue shaft. The distance between the two shafts is 500 feet.

Lincoln *News-Messenger*: F. Pohl has made a strike on Bear river, near the Nevada and Placer county line. W. Taylor, Supt. Whisky Diggings mine, is interested.——At the Algol copper mine rich developments have been made recently. At the 100-foot level a 65-foot vein of copper ore was struck. Fourteen feet of the vein contains quartz bearing gold. The remainder of the vein carries copper, which varies from 3% to 40% in value. The mine is on Dry creek and is managed by Anderson Bros.— —Houchin & Dixon have begun crushing sixty-seven tons of ore from the Conrad extension, near Ophir.——The Mayflower Co., near Forest Hill, is building a new reservoir, which will give a pressure of 100 feet.——It is reported that R. Greenwood has struck some rich quartz at a point across Volcano canyon from Bath.——At the Dardanelles mine, near Forest Hill, the McDonald Co. has pumped out the slope and run through the bedrock and is breasting into the gravel.

Plumas.

Quincy *Bulletin*: W. S. Chapman has a bond on the Johnny Bull mine, near Greenville, and has fifteen men at work. Preparations are being made to erect a hoisting plant and to sink a shaft 500 feet deep.

Riverside.

The new mining camp called San Vicente is in the southwestern corner of Riverside, near the junction of the Orange, San Diego and Riverside county lines. It is here that, it is claimed, tin bearing veins have been discovered. Placer nuggets are being shown from Lucas canyon in this vicinity. A large number of claims have been located.

San Bernardino.

Needles *Eye*: L. Gray, owner of the Lum Grey properties, sixty miles southeast of Danby and twenty-three miles west of the Colorado river, has built a large barge, loaded it with a cargo of supplies and has gone down the river to the nearest point to his mines, from where they will be taken overland by wagon. He has placed in position a 3-stamp mill, which has given good returns so far. The mill was taken overland sixty miles from Danby by wagon, across the desert.

San Diego.

A Los Angeles company will bore for oil at the town of Del Mar. A large tract of land has been leased and the operations are to be carried on within the town of Del Mar, where indications of oil are found.

San Luis Obispo

San Luis Obispo *Tribune*: Paso Robles is surrounded by surface indications of oil. Near Adelaide the water of several springs has been found to be filled with hydrocarbon substances. One of these springs is on the ranch of E. Smith.

Arroyo Grande *Herald*: The Lahabra Oil Co. has shipped its drilling plant from Whittier to Arroyo Grande, to be put up in Phœnix canyon. The Puente Oil Co., through W. H. Toland, has secured leases on 25,000 acres of land on the Huasna and will commence boring in the spring. The Los Angeles Petroleum Development Co. will commence operations in December in Tar Spring canyon.

Santa Barbara.

Santa Barbara *Press*: Fifteen thousand barrels of oil were shipped from the Summerland oil fields during October. The lowest price received by any of the producers was $1 per barrel.

Shasta.

(Special Correspondence).—In the Summit mine, a copper property, near Kennett, two tunnels and a shaft aggregate 160 feet. Work continues. The property comprises eight claims.

In the Mammoth copper group a good gold prospect was found in one of the lower tunnels last week.

P. Gibney of San Francisco is having 200 feet of tunnel cut on the Oakland mine, near Muletown. The work is on the vein.

On the Brown Bear, near Shasta, 100 feet of tunnel has been contracted and work began this week.

On the Lowden & Friday property, near Kennett, comprising eight claims, work continues. The property is under bond. Last week some ore was sent to Selby's for an assay, which yielded about $5 per ton gold and silver and nearly 9% copper.

Redding, Nov. 7th, '99.

Mr. Tarbet says of the Afterthought group that has been tied up for some time by his people on a $150,000 option that they found it necessary to dismiss the proposition, as in going down with two winzes the percentage of copper was reduced, while the zinc increased. Ten thousand dollars was paid in cash for the option. Since that $8000 has been spent on development.——Steady work is progressing at De Lamar's Bully Hill group. Admittance is denied all visitors, but the report locally is that developments thus far have been satisfactory.

Redding *Searchlight*: An option on the Bennington mines, formerly the Nellie group, owned by J. Keane, near Iron mountain, comprising nine claims, has been given to San Francisco parties. It is proposed to run an 800-foot tunnel to open the ore bodies. The tunnels now in aggregate 600 feet, and the ore bodies average 2½ feet in length. The price of the property is said to be $25,000.

Sierra.

Downieville *Messenger*: F. J. Cook will begin shipping ore from the Oro Fino mine, in which he and J. Clark are interested. They have fifteen tons ready for shipment to the smelter.

Siskiyou.

Yreka *Journal*: Mr. Souther, manager for the company which will open Yreka creek with a dredger, will have seventeen carloads of machinery and lumber hauled into Yreka. ——James Ironsides, of Cherry Creek, has made a strike in his ledge on Deadwood divide, recently bonded to parties who gave up the property. Ironsides sunk a shaft 100 feet and struck a new body of ore 10 inches in width.——The Sheba M. Co. has an air compressor at the Y. R. R. depot, besides other machinery. It is reported that work will be started again.

Trinity.

(Special Correspondence).—A company, com-

posed of New York, Chicago and San Francisco people, five in all, are fitting up a hydraulic plant of considerable magnitude fifteen miles above Weaverville, on Trinity river. They are placing a 4000-foot syphon of 24-inch steel pipe and 2000 feet of hydraulic pipe. They are building a trestle across the river of heavy iron. They have bought 640 acres, known as the Bergin land, and 150 acres from a Chinese company. They have cut a three-mile ditch through bedrock, with a grade of 13 feet to the mile. The pay gravel in the 640 acres is 100 feet deep, 5000 feet long and 650 feet wide, having a 605-foot dump into the river. F. H. Hall is superintending the work. His headquarters are Weaverville.

Weaverville, Nov. 6th, '99.

Redding *Searchlight*: Since May of the present year J. S. Childs has been supervising work on the quartz property on Bully-choop. The property is being operated by thirty men. The ledge is being drifted, sinking will be commenced and work has begun on a 10-stamp mill.

Tuolumne.

R. T. Sorrenson of the Gold Bug mine, one and one-half miles northwest of Big Oak Flat, has a 4-foot ledge spotted with gold. In this claim, which has been worked extensively in a superficial way for pockets, is a dyke of diorite carrying gold in paying quantities.

A few weeks ago all the principal mines of the county were idle for lack of water. Many have resumed since the rains.

The Golden Gate mine at Sonora has commenced work again and is running with a full force. Water power is used.

A rich body of ore has been encountered in the lower workings of the Confidence mine at Confidence. This mine has produced over $5,000,000 and when owned by Ben Holliday was one of the largest producers in California.

Forty stamps were started up in the Jumper mill last week. Steam power is being used.

Within sixty days a stamp mill will be erected at the Draper mine, near Soulsbyville, the ground being already broken for it. Sinking was begun last week.

Union-Democrat: At the Hazel Dell, eight miles north of Soulsbyville, the mill starts up Dec. 1st. The 1300 feet of pipe line now being connected with the ditch taking water from Five-mile creek will give a pressure of 400 feet, and, beyond the first cost, the water is free. In the mine, since tapping the vein by means of a tunnel, drifting north and south has opened a body of good ore, 600 tons of which is on the dump. There has been 200 feet of drifting either way on a 4-foot vein. There remains 50 feet to raise to the surface with the 200-foot upraise. —— The Bonito mine, located between the Consuello and Grizzly, a mile south of Carters, owned by the J. G. Fair estate, is to be worked.——The Triumph mine, above the Grizzly, owned by A. C. Maier, is producing good ore. A tunnel is being driven on the vein which varies in size from 1½ to 4 feet. A shaft will be sunk at the mouth of the tunnel.

Sonora *Independent*: The Mt. Jefferson mine at Groveland is reported improving with development. The 10-stamp mill is being built. ——It is reported that the Mt. Zion mine, near Groveland, will commence sinking a new shaft.——The Kanaka mine is still idle. It is reported the directors have decided to sell the mine.——The Little Wonder mine, near Big Oak Flat, under the management of Milligan & McCallum, has made a strike rich in gold and sulphurets.——A rich strike was made in the King mine in Deer Flat a few days ago. The owners are Hendron & Byrne.

COLORADO.

CHAFFEE COUNTY.

Pueblo *Chieftain*: There is now going on in Turret mining camp, twelve miles north of Salida, a mining boom. A large amount of machinery has recently been taken into that camp.

CLEAR CREEK COUNTY.

The Calumet M. & M. Co. have shipped a trainload of ten cars of concentrates from the Jackson mill to Denver smelters.

The Gold Rock mine is to have a new 40 H. P. hoist. The shaft, now down 720 feet, will be sunk to 800. It is to be operated by the Springdale Co., F. Stansfield Mgr.

GILPIN COUNTY.

The Gunnell M. & M. Co., F. C. Young Mgr., has shipped its first bullion—$10,080. Seventy men are employed.

During October there were shipped from Black Hawk 296 cars of ore, aggregating 5475 tons, showing an increase of seventy-five tons over those of the corresponding month of last year.

Fifty men are employed in the Perigo, who are mostly working under lease or tribute from the Tonawanda Leasing & Mining Co., of which E. M. Messiter is Mgr. Ore is being taken out to keep twenty fast-drop stamps going at the Perigo mill, treating fifty tons per day. Other leasers working the upper workings are shipping their product to the Rollins mill, which is leased by D. C. Enearl.

Central City *Register Call*: The machinery to be placed on the Topeka mine, in Russell Gulch, is to have a capacity for working to a depth of 2000 feet, and the plant which is to replace the one recently destroyed by fire on the California will work to the 2500 level.—— The main shaft on the Cook mine, on Bobtail hill, is at a depth of 900 feet. Sinking has been stopped, but will be resumed when connections are made with the crosscut from the Gregory vein. Eighty men are employed. As soon as the new mill is completed, the force at the mine will be increased.

LAKE COUNTY.

The lease on the Ruby mine on the Adelaide park slope of Iron hill has recently been incorporated for $50,000, by W. A. Moore, J. M. Maxwell and T. Horrigan. This company has developed the property, which is on the same ore chute as the Louisville & Colorado No. 2. Large bodies of low-grade oxides and sulphides have been opened, and three eight-hour shifts are running for the Louisville ore chute.

The Penn mine on Breece hill, Leadville, produces 4000 tons of $27 gold ore monthly.

Leadville *Miner*: The Tiger mine, located on the Iowa gulch slope of Printer Boy hill, near the Continental Chief, is being reopened by T. Crocombe, general foreman of the Ibex mines, and associates. Development is progressing through the North Star tunnel, which at 450 feet will cut the ore body on its dip. The tunnel is in 400 feet and ore has been shipped from development work. A. Pasco is also interested and in charge of the work.

MINERAL COUNTY.

The unwatering of the Amethyst mine, commenced some months ago, is rapidly nearing completion. The first hole was finished last night, and the water is now running through into the Last Chance shaft and draining from there. About two weeks have been consumed in making the connection, and but one more hole is necessary to completely drain this producer.

TELLER COUNTY.

In the suit between the Jack Pot and the Doctor, at Cripple Creek, the first hearing resulted in the case being continued until Dec. 4th, '99, and meantime both parties to the suit are restrained from mining in, or extracting ore from the disputed territory. No evidence was introduced. The case was continued on the request of the Doctor attorneys for more time in which to prepare their case. If either party desires to do any work within the ground in controversy, or within the lines or possession of the other party, and the parties fail to agree upon the place or work to be done, mode of access and the persons by whom such work will be done, or upon any other terms, either party may apply to the court for leave to do such work upon forty-eight hours' notice to the other side. This order will, it is stated, in no way interfere with the operations of the Creston G. M. Co., operating the Jack Pot property.

Cripple Creek *Times*: The production of the Moon-Anchor mine is fifteen tons a day of a good grade of ore. Stoping was recently commenced in the sixth level, while extensive development work is going on north and south of the shaft in the same level. The water is lowering 8 inches a day without pumps. Two shifts are working.——Sinking has been resumed in the main shaft of the Dillon mine. It is the intention to sink the shaft to 600. The vein encountered a few weeks ago has widened to 6 feet and samples taken across it show returns of three ounces of gold to the ton.

IDAHO.

BLAINE COUNTY.

Hailey *Times*: The returns on the carload of ore shipped from Copper Basin to Salt Lake were 3 85 ounces silver, 23.55% copper, and three-tenths of an ounce of gold per ton. The dry weight was 42,500 pounds. Regular shipments will begin.

IDAHO COUNTY.

(Special Correspondence). — Moose Creek placers have closed down for winter after a satisfactory season, the first full season's run in the old channel gravel since the claim was jumped from Chinese in 1889. Operating on 30 to 50 feet of gravel, 30-inch flume, 6-inch to 12-foot grade, with 600 miners' inches of water, two giants, 4-inch and 2½-inch nozzles respectively, a trifle over 1000 cubic yards per day of gravel is broken. A shaft recently sunk on the "West Ridge" deposit of this mine shows 90 feet of gravel and no bedrock at that depth. The Idaho Co., operating American Hill placers at Elk City, operate 6-inch and 4-inch nozzles on 85 to 100 feet of gravel, using 800 miners' inches of water. The top 40 to 60 feet is stripped through 3-foot flume, 7-inch grade, the bottom elevated 23 feet by hydraulic elevator and run through 3-foot flumes, 3-inch grade. They report very satisfactory results from the season's run. Buffalo Hill, operating on 100 feet of gravel near Elk City, likewise reports a good season's run and comfortable results. This property is now principally owned by Rod Leggatt of Butte. The mine is operated through a 3-foot flume, 2-inch grade, with 700 miners' inches of water under 200-foot pressure.

The Iron Crown quartz mine at Newsome paid its first dividend in October. It is operating two Kinkead mills on 2 to 5 feet of free-milling rock, said to carry good values. An accident to its reservoir has compelled a temporary shut down.

Near the old Clearwater station, a populous placer camp in the 60's, a number of quartz prospects are attracting attention. The veins are said to be strong, carrying gold, silver, copper sulphides and galena. Some rich pieces of rock are being brought out. There is little development as yet. Several of the boys have supplies in for a winter's work, however, on their claims.

Moose Creek Placers, Newsome, Idaho, Nov. 1st, '99.

OWYHEE COUNTY.

The refinery at the De Lamar mill has been put in operation, and hereafter bullion will be again shipped instead of auro cyanides, as has been done since the leaching plant was started. The pulp taken from the presses is first dried in shallow pans in a furnace constructed for that purpose, and is then dumped into a lead-lined vat where the zinc powder is dissolved with sulphuric acid. The remaining product is melted into bars.

Silver City *Avalanche*: The transfer of the Black Jack group of mines to the Trade Dollar Con. M. & M. Co. was made last week, and Supt. Irwin of the Black Jack has turned that property over to Supt. Hutchinson, who represents the purchasing company. The deal places under one management forty-nine mining claims. The Black Jack has been a steady and profitable producer for eight years. Last spring a heavy flow of water was encountered in its lower levels, which rendered the pumping plant inadequate and the mine was closed. The acquisition of the ground will give the Trade Dollar Co. access to the Boonville and others of their claims through the Black Jack tunnel. Their tunnel being driven from Dewey will drain the lower levels. This tunnel when completed will have a length of 17,500 feet.

SHOSHONE COUNTY.

The new concentrating mill at the Sixteen-to-One mine, near Wallace, will be finished the latter part of this month.

Spokesman-Review: Clark & Sweeny, of Spokane, have a bond on seven-sixteenths of the Big Buffalo group for $87,500. Captain Woods has closed a deal at Grangeville for a bond on the controlling interest, presumably nine-sixteenths of the property. Clark & Sweeny were the first to bond this group of claims, the first locations on Buffalo Hump and the properties which caused the first stampede to that camp. The first bond was for $550,000, and the firm later concluded it was too much and threw it up.

MONTANA.

SILVER BOW COUNTY.

The dead work which the owners of the Anaconda Copper Co. are doing is interfering with the output of the mine. It is said that the former owners exhausted the ore reserves and were not particular about timbering the drifts and stopes from which the better class of ore was taken, and the present owners must retimber these portions of the mine, which prevents the taking out of ore from the richer portions of the mine while this dead work is in progress. The only available ore is from the reserve of lower grade ore. The quantity of ore being taken out is about the same as heretofore, but the net results are smaller. From an average monthly output of 11,000,000 pounds of copper, two years ago, it has fallen to 8,500,000 pounds.

Butte *Miner*: F. A. Heinze a few months ago secured a lease and bond on the Homestake mine, in Horse canyon, near Butte. He put men at work cleaning the property up. There is said to be 300 feet of water in the mine to be pumped out. When the water is under control, exploration will commence. The mine is located directly east of Butte, in a region where copper indications have been frequently struck by prospectors in small shafts and tunnels. The copper zone of Butte is recognized as being two miles long by one mile broad. Outside of that area no extensive leads have ever been found, though comparatively little work has ever been done off the main Butte hill.

Butte *Inter-Mountain*: A deal was consummated in Butte on the 1st inst. by which mining property in the southern portion of the city changed hands. The claims sold are the Red Chief and Lizzie. The former was owned by W. P. Gwinn and J. Ducie, who received $80,000 for the mineral title, including a few lots reserved for mining purposes. The Lizzie was owned by Hickey Bros., who sold the Anaconda to J. B. Haggin and M. Daly. It is south of the Moonlight. The consideration was $175,000. This also includes a few lots and the mineral right. The deal is said to be in the interest of the Amalgamated Copper Co.

NEVADA.

EUREKA COUNTY.

Eureka *Sentinel*: The Ruby Hill mines continue shipping a considerable amount of ore, taken out under the tribute system. There are twenty-five men at work at the Eureka Con. mine, fifteen at the Richmond and sixteen at the Jackson. Some of the ore is of a fair grade, but most of it is low-grade iron ore, which would not pay for extraction in the early days. The iron casing of nearly all the chambers carries more gold, in proportion to the value of the ore, than did the ore within the chambers.

ESMERALDA COUNTY.

Hawthorne *Bulletin*: Among the properties to which the Vulcan Co. has succeeded is the Parrot group of mines, five miles east from Luning. The group consists of several claims. Forty men are employed, and the company have out 5000 tons of ore. The company have a double-compartment shaft down 130 feet. ——Men are employed at Sodaville dismantling the Mt. Diablo mill and getting that place in readiness for a 75-ton smelter. The Colorado Iron Works, through its Mgr., Mr. Grant, is pushing this work.

LANDER COUNTY.

Austin *Reveille*: The Nevada Co. of Ione has purchased the Cirac group of claims, located in Union canyon, for $3000.

LYON COUNTY.

A gypsum-grinding plant is being constructed at Empire by ex-Gov. Adams of Nevada for working the deposit near Mound House.

STOREY COUNTY.

The latest telegram concerning the progress of pumping operations at the C. & C. shaft is as follows:

VIRGINIA, Nev., Nov. 9, 1899.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco: At 6:30 this morning the water was 115 feet and 4 inches below the 1950-foot level station. No. 2 elevator has been running continuously. JOS. R. RYAN.

The Risdon Iron Works at San Francisco, Cal., have notified the Comstock Pumping Association that the new castings for No. 1 elevator are ready for shipment to Virginia City and they expect that within a week No. 1 elevator will be ready for operation.

OREGON.

BAKER COUNTY.

At the Bonanza mine the miners struck last week upon refusal of the management to reduce the working hours on night shift from ten to nine.

Baker City *Democrat*: A strike of free gold has been made seven miles east of Baker City by Withey & Suddock, in their Golden Eagle group, located near the Flag staff and Virtue-Collateral mines. The group consists of three claims. On one claim there is a ledge 12 feet wide which assays $10.25 to $20.50 per ton, and another claim has uncovered a 15-foot lode running $12.80 to $40 per ton.

Carson *Tocsin*: A gold strike is reported from Snake river, one mile above the mouth of the Powder river on the Oregon side. The discoverer was A. Holcomb, a miner in the employ of the C. M. of O. Co. The ore is favorably located.

GRANT COUNTY.

It is reported at Susanville that the Badger M. Co., in its Badger mine, a few days ago, struck 4 feet of shipping ore.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Otto Grantz is preparing a second shipment of ore from the Hidden Fortune mine, near Terraville, to Denver, Colo. The first carload returned $79,000 and the ore now to be shipped is also very rich.

UTAH.

The October dividends paid by Utah mines amounted to $195,000, as follows: Bullion-Beck, $10,000; Daly-West, $30,000; Mammoth, $40,000; Mercur, $50,000; Petro, $5000; Sacramento, $5000; Silver King, $50,000; Swansea, $5000.

JUAB COUNTY.

Orders have been placed by the South Swansea M. Co. of Silver City for a new hoisting plant, including boilers, pump and steel cable. The boilers will have a capacity of 160 H. P. The hoisting engine will sink to a depth of 2000 feet, should such a depth be required of the plant. The management will extend the workings to a depth of 1000 feet.

SALT LAKE COUNTY.

M. Gisborn, who has run a tunnel into the old Mono mine, Dry canyon, 2300 feet, is going ahead until the ore bodies are recovered. He says the recent shipments from his camp were from the dump that was piled up with low-grade ores in the palmy days of the property, and not from new workings. The dump contains 30,000 tons of ore that is being concentrated with jigs. The tunnel is in a stratum of white limestone, impregnated with fine particles of galena, this coming in after it had passed through material that was heavily copper-stained.

TOOELE COUNTY.

High-grade ore shipments from Deep creek mines to Salt Lake are again attracting attention to that district.

The auro-cyanides shipped to Salt Lake during October were valued at $235,000.

UINTAH COUNTY.

A. D. Ferron reports 200 tons of elaterite ready for shipment from the Raven Co.'s mines in Indian canyon, and teams will haul it to the Horse Creek spur on the Rio Grande Western, a distance of thirty miles from the mines. This will be the first large shipment made by the company over its new road, and $16 per ton is saved by shipment to Horse Creek instead of to Price.

UTAH COUNTY.

M. Kelly, who has been working in the Mt. Nebo mining district, doing development work on a claim owned by Springville people, reports a 5-foot vein of high-grade ore in the claim, which goes 68% lead and $50 per ton in silver.

WASHINGTON.

FERRY COUNTY.

Spokesman-Review: The Ireland is to begin development work. It was one of the first claims located in Republic camp. The claim has been opened in several places by cuts for a distance of 400 feet. The ledge shows 15 feet of quartz on an average. The crosscuts are 6 feet deep.

Republic *Pioneer*: Work on the Mountain Lion mill, at Republic, is progressing favorably. In ten days everything will be ready for placing the stamps and cyanide tanks, and the hoist for the mine will be ready at the same time. The mine is in good condition for producing ore. There are about 4500 tons on the dump. The winze from the tunnel has reached a depth of 112 feet.

Spokesman-Review: A strike is reported in the Tom Thumb mine at Republic. The south drift at the 150 level shows 5 feet of ore which has assayed $200 per ton. It is thought that it will average $100 per ton. In the north drift is 3 feet of fair-grade ore.——Republic is to have a custom mill. It is reported that Anaconda capital is backing the enterprise.

WYOMING.

ALBANY COUNTY.

The Halleck Canyon Graphite Co. has opened a large vein of graphite in Halleck canyon, west of Laramie.

CARBON COUNTY.

Grand Encampment *Herald*: At the depth of 66 feet a new shoot was cut in the Eureka mine, near Grand Encampment. The lead is 28 inches of solid ore, 18 of it being as rich as the ore first discovered.——J. J. Mackey has located seven claims on Big creek, ten miles southeast of Grand Encampment, on the Cox lead, which is fully 40 feet in width, with ore averaging 14% copper and carrying silver and lead.

FOREIGN.

MEXICO.

Chihuahua *Enterprise*: The new 1400-foot shaft, which is the deepest in the Santo Domingo mine, Santa Eulalia district, of the Chihuahua M. Co., has 49 feet of water in it. The company has been sinking this shaft to hoist ore from side drifts and stopes. Water was struck 50 feet above the bottom. This is the first large body of water ever struck in any of the mines of this district. The regular price of water at the mines has been 12½

cents per eighteen gallons for the past year, and at times water has been very scarce in the town of Santa Eulalia. If this proves to be the water level it is a valuable strike.

BRITISH COLUMBIA.

About 700 men are employed by the mines of the Slocan, where 2500 men are usually at work. The mine managers are desirous of keeping the mines open. Some of the mines are closed altogether.

A $100,000 gold brick, the largest ever melted in a Canadian mine, is to be sent down from the Kootenai district. This year's clean up is the richest ever known in the district. The Slocan strike is still unsettled. Non-union miners being brought in has caused the strike to spread to several hitherto unaffected districts. A. W. McCune of Salt Lake will, it is said, make a test of the eight-hour law, which caused the trouble.

Spokesman-Review: J. Tichener of New York, of the British Columbia Copper Co., which owns the Mother Lode, has organized the No. 7 Mining Co., under the laws of West Virginia, to operate the No. 7 and other claims in Central camp. On the No. 7 is a 139-foot shaft, at the bottom of which are 450 feet of drifts and crosscuts. The principal values are in gold and silver. The lead on the surface has been opened by cuts for 700 feet.——A rich strike of copper-gold ore is reported from the Majestic in Central camp.——The London & B. C. Gold Fields will shortly resume work on the Norfolk, in Central camp.——The ore in the Mother Lode at a depth of 285 feet is said to be improving in value.——A. L. Watson, formerly of Rossland, has the contract to sink the working shaft of the B. C. in Summit camp an additional 100 feet.——H. N. Galer, Sec. Granby Smelter, and Eastern capitalists, have made the first payment to Rogers & Jones on the Hartford & Ranger group in Wellington camp The Canadian Pacific graders, while building the spur to Central camp, uncovered several rich ledges on the Hartford. The group will be a shipper in the spring.——W. L. Hogg of Montreal has bonded from R. Stewart the Calumet & Hecla group in Wellington camp for $50,000. The property will be developed.

Industrial Notes.

—On the Pacific coast there is a telephone to every twenty-eight inhabitants.

—Dumont, Colo., is to have an electric plant to furnish power to mines and mills.

—The Canadian Pacific Railroad will double-track its line from Vancouver to Montreal.

—Nothing but a reversal of the order closing the Philippine ports will prevent a famine in hemp.

—At Berkeley, Cal., the Sunset Telephone & Telegraph Co. are putting their wires underground.

—A large electric power plant is to be built at Flint Creek Falls, Montana, by the Montana Electric Power & Mining Co.

—The Baltimore & Ohio Railroad has strung 2000 miles of copper wire during the past year, weighing 166 pounds to the mile.

—Twenty miles of aluminum wire will be employed on the electric road now being built from Kansas City, Mo., to Leavenworth, Kan.

—Nearly $1,000,000 have been invested in gilsonite claims on the Colorado-Utah State line by Boston men, and considerable will be spent in development.

—Spokane men will put $200,000 into the building of an electric railway between Tacoma and Seattle, Wash., and expect an additional $800,000 from Eastern investors.

—A railway is to be built on the island of Hawaii from Hilo, the principal city on the eastern coast, to Makusona, with a total trackage, including branch lines, of 130 miles.

—From July 12th to Oct. 20th the White Horse, Alaska, horse railroad carried 11,000 tons of freight over its five miles of wooden length for $20 per ton. Next season the railway takes its place.

—Plans have been prepared for the construction of a railroad from Kurunegala to Kankasantural, in Ceylon. Particulars, forms and estimate of cost may be had of the Imperial Colonial agents, Downing St., London, Eng., by depositing $500.

—Near Bakersfield, Cal., the Power Development Co. will spend $100,000 replacing their present wooden flume with a tunnel through solid granite. The tunnel is 3400 feet long. It will be 7x6 feet and coated with concrete. The grade will be such that water may be carried to develop 12,000 H. P.

—The South African war has checked shipments; nearly all exports of American manufactures have been stopped until the safety of the material is assured, buyers having to stop all shipments, as the safe delivery of British goods in the Transvaal or Cape Colony will be impossible till after the cessation of hostilities.

—Aluminum is to have its first important trial as a conductor of electricity on the Chicago Northwestern elevated road. Twenty miles of 1¼-inch cables (150,000 pounds) are to be strung along the steel trestle to distribute the motive power to the trolley rails of the new road. Copper has almost doubled in price within a year; the lighter metal has dropped a shade in the scale of values.

—General Greely, Chief Signal Officer, U. S. A., says as to a Pacific cable: "In order to join closer together the United States and its Pacific colonies it is essential to span the Pacific by a submarine cable, as recommended by the President to Congress in his message of February 10th, '99. The great value of such a cable is not alone for military purposes, but more especially for the fostering of industrial interests in the new colonies and in order to facilitate commercial operations."

—Instancing the present scarcity of workmen in the Canadian West, the *American Manufacturer* notes where agents of some American contractors have been actually "stealing men." They offer higher wages and thus induce the men to go across the border. The contractors for the Ontario & Rainy River Railway report that they needed 2000 men but have only succeeded in securing 500. Wages being paid match those given in the early days of American railway construction west of the Mississippi; $2 to $3 is freely offered.

—Commerce between the United States, Hawaii and the Philippine Islands grows rapidly. The following tables show the exports to and imports from Hawaii and the Philippines in the nine months of each year since '94:

EXPORTS FROM THE UNITED STATES TO—

Nine months ending Sept. 30—	*Hawaii.*	*Philippines.*
1894	$2,431,098	357,473
1895	3,178,898	121,348
1896	2,900,807	112,148
1897	3,76 208	54,260
1898	4,579,827	84,856
1899	8 230,016	777,329

IMPORTS INTO THE UNITED STATES FROM—

Nine months ending Sept. 30—	*Hawaii.*	*Philippines.*
1894	$8,154,193	$2,307,006
1895	9,960,149	3,254,445
1896	13,602,961	4 603,823
1897	13,044,231	3,392,060
1898	14,611,285	3,164,004
1899	19,49 ¹,831	4,493,302

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCTOBER 31, 1899.

636,114.—TREATING ORES—Cain, Soderling & MacKnight, Bodie, Cal.
636,117.—SEPARATING BITUMEN—A. S. Cooper, S. F.
636,199.—CUE CHALKER—C. W. T. Davies, S. F.
635,757.—CAR COUPLING—C. E. C. Eddy, Tacoma, Wash.
636,136.—VACUUM TANK—L. L. Gross, Petaluma, Cal.
636,202.—ELEVATOR—C. I. Hall, S. F.
635,852.—TELEPHONE CALL APPARATUS—G. B Heath, S. F.
636,139.—FIRE ALARM SIGNAL CIRCUIT—W. R. Hewitt, S. F.
636,231.—HEEL SHAVE—E. Hoglund, Los Angeles, Cal.
635,778.—BICYCLE BRUSH—W. A. Hudelson, Jefferson, Or.
636,211.—SHOE BLACKER—T. E Lister, Los Angeles, Cal.
636,169.—DOOR OPENER AND CLOSER—J. Ohring, S. F.
636,177.—CAR SAFETY LADDER—J. H. Rapp, Fort Apache, Ariz.
635,809.—STRAW STACKER—W. W. Richardson, Pomeroy, Wash.
635,945.—THAWING EXPLOSIVES—W. J. Smith, S. F.
635,824.—LIFTING JACK—L. C. Vickrey, South Bend, Wash.
636,090.—AIR HEATER—Waterman & Morison, S. F.
636,091.—FLUID HEATER—Waterman & Morison, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Commercial Paragraphs.

THE General Electric Co. is sending three 525 kilowatt generators to Buenos Ayres, South America.

THE E. P. Allis Co. of Milwaukee, Wis., have orders for three 1500 H. P. engines for street railways in Havana, Cuba.

GEO. E. DOW of Dow steam pump fame is about to build a $50,000 five-story manufacturing establishment corner First and Natoma streets, San Francisco, the entire structure to be used in the manufacture of his pumping machinery.

THE Ratcliff Consolidated Gold Mines, Ltd., Ballarat, Inyo county, Cal., have purchased a carload of steel cable for their new double-rope tramway, 8000 feet of which is 1-inch interlocked coil rope, made by the Trenton Iron Co. of Trenton, N. J., to be used as track rope. The Vulcan Iron Works of San Francisco are building the terminals and conveying machinery, which will be shipped the 20th inst. The tramway will have a capacity of 150 tons in ten hours and will be in operation within ninety days.

Catalogues Received.

WESTINGHOUSE Railway Motors, and the Westinghouse Electric Pneumatic System for Controlling Railway and Other Motors, are the respective titles of two sumptuous pamphlets illustrating and describing such latest designed apparatus, with technical details of construction. The Westinghouse Companies, Pittsburg, Pa.

THE Jackson Drill & Mfg. Co., 1756 Larimer St., Denver, Colo., has issued a fine catalogue (No. 11) of the Jackson hand power rock drill, an illustrated description of the drill, on heavy plate paper, with full showing of the drill's construction and operation, and numerous testimonials from miners who have used and like the drill, and whose names and addresses are given. A pleased customer is always a good advertisement, and the publication of what practical men think of a device or apparatus is good business.

Recently Declared Mining Dividends.

Swansea, Utah, $5000; Nov. 10.
Mammoth, Utah, $40,000; Nov. 4.
Daly-West, Utah, $30,000; payable Nov. 20.
Bonanza M. Co., Washington, $2500; payable Nov. 20.

Personal.

C. H. LINDLEY has returned from Wardner, Idaho, to San Francisco.

F. WHITLOW is the new Supt. Lightner mine, Calaveras county, Cal.

G. G. GATES of Jackson, Cal., is in San Francisco on mining business.

T. R LOMBARD of San Diego, Cal., will develop the Cedros island gold mines.

ROSS E. BROWNE has returned to San Francisco from a professional trip to Nephi, Utah.

PROF. W. L. WATTS left San Francisco for the Los Angeles, Cal., oil field on the 9th inst.

ISIDOR DAVIDOV goes as Supt. Santa Barbara placers, Zaragossa, Antioquia, Colombia, S. A.

HUBERT VISCHER has returned to San Francisco, having completed the government work on the Yuba river, Cal.

A. P. BRAYTON SR, Pres. Pelton Water Wheel Co., San Francisco, is home from an extended European tour.

JOHN HOWELL, formerly of the Broken Hill, is inspecting the properties of the Great Australian Quicksilver Co., N. S. W.

C. W. MERRILL, who has been erecting cyanide plants in Montana and South Dakota, returns to Alameda, Cal., this week.

E. A. WILTSEE is en route from San Francisco to London. The proposed visit of John Hays Hammond is indefinitely deferred.

JOS. SELLWOOD has been appointed Gen. Supt. American M. Co., the Lake Superior department of the American Steel & Wire Co.

W. H. RANDS has been appointed government geologist Queensland, Australia, Mining Department, at an annual salary of $4000.

M. L. REQUA of San Francisco, who returned from a recent visit to Arizona on the 3rd inst., has returned to Kingman, Arizona.

COL. GEO. STONE, contractor for the coast railroad gap between Elwood and Surf, Cal., says the road will not be finished before November, 1900.

J. H. CURLE has visited 225 gold mines in the Transvaal, Australia and New Zealand, etc., and is coming to the United States to increase the list.

E. F. GROPELLO, till recently in charge of the cyanide plant at the Taylor mine, El Dorado county, Cal., left San Francisco on the 10th for Turin, Italy.

O. O. HOWARD JR., Pres. Ratcliff Consolidated Gold Mines, Ltd., and the Mt. Shasta Gold Mines, Ltd., has returned to San Francisco from New York.

J. L. FLOOD, one of the owners of the Allison Ranch mine, near Grass Valley, Cal., in company with W. R. Eckert and J. E. Walsh has made an inspection of the mine.

COL. S. H. LUCAS, who recently sold his gold mine in Calaveras county, Cal., to Mr. Posey of Colorado, has taken his residence at San Diego, Cal., for the winter season.

ED KANE has resigned the superintendency of the Ford mine, Calaveras county, Cal., and takes charge of the Hayward & Lane mine, Shingle Springs, El Dorado county, Cal.

JAS. TAYLOR, who has been in receipt of a yearly salary of $5500 as government metallurgist, New South Wales, has resigned to take charge of a mining property of his own.

F. R. MORE, Gen. Mgr. St. Anthony M. Co. of California, is in San Francisco from Omenica, B. C., and reports a prosperous season. His operations are near the Arctic circle, 700 miles north of Ashcroft, B. C.

C. MINOT WELD of Boston, Pres. Melones M. Co., has left Boston for a visit to the mine. Mr. Eustis, a mining engineer, will accompany him for the purpose, it is understood, of making an expert examination.

PAUL K. BRAWD, consulting engineer Russian Electric Co., St. Petersburg, expects to make another visit to the United States, to arrange for the Russian representation of several American machinery concerns.

F. E. WARE, Vice-Pres. Mt. Shasta Gold Mines, Ltd., and Pres. Bertha G. M. Co. of Sonora, Mexico, has gone from San Francisco to Mexico on an inspection of the new mill which is about completed at the mines.

H. F. ELBON, Pres. Arctic Hot Blast M. Co., is back from Cape Nome. He says there will be considerable litigation there in 1900. During the season water was 25 cents per bucket, beef $1.25 per pound, wood $50 per cord and coal $60 per ton.

ROBT. B. STANTON, the mining engineer who took the perilous boat ride through the Grand Canyon of the Colorado in '89, is in San Francisco from Pennsylvania. He says there are no insuperable engineering difficulties in building a railroad through that superb extent of scenery.

S. B. EVERETT, American consul at Batavia, Java, says that attempts are being made to deceive the public by reports of valuable gold mines in the islands of the Dutch colony, Celebes, Borneo and elsewhere, and that the most of the reports and prospectuses are combinations of swindling, greed and plunder.

K. TAKEDA, chief engineer Kosaka copper mines, Ri Kuchu, Japan, who has been looking at California copper methods, goes to Europe. The Kosaka is the largest copper mine in Japan, employing 3000 men, who each earn 30 cents per day. The silver is retained for Japanese coinage, and the copper exported.

F. A. CORNELL of San Francisco has returned from an extended sojourn in the placer gold mines of the Dolores river, southwestern Colorado, where the Western Electric Co. of Chicago has built a dam twelve miles above the placer deposits, transmitting power to dynamos which pump water up 100 feet into reservoirs to furnish necessary pressure to work the giants.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FLUID HEATING APPARATUS.—E. R. Waterman and R. R. Morison of San Francisco, Cal. E. R Waterman having assigned his interest to P. S Regnart of same place. No. 636,091. Dated Oct. 31, 1899. The object of this invention is to provide an apparatus which is especially designed for heating liquids for various uses. It comprises an exterior containing vessel having rigid therewith an interior double-walled chamber segmental in cross-section, said chamber having its double walls closed at the top and open at the bottom, and at one side an open communication with the exterior vessel. An electrical heater is preferably employed, and the form of the chamber is such that a free circulation between the inner and outer portions is provided so that the liquid may be further rapidly heated.

VACUUM TANK AND WATER LIFTER.—L. L. Gross, Petaluma, Cal. No. 636,136. Dated Oct. 31, 1899. This invention is designed to provide a water-lifting apparatus which can be utilized for the purpose of filling tanks with water or other liquid or semi-liquid which can be drawn into the tank by vacuum. It consists of a tank having inlet and outlet openings, a source of supply for gas-producing material, a measuring chamber intermediate between the source of supply and the vacuum tank, and this is adapted to discharge the gas-producing material into the tank. A valve stem extends therethrough having valves fixed to it with such relation to each other that when one valve is closed the other is opened, the lower valve being normally closed by a spring, and there is a lever by which the upper valve may be closed and the lower one opened. Means are provided for producing an explosion of the gas within the tank and the subsequent contraction produces a vacuum which will draw up the liquid into the tank.

DOOR OPENING AND CLOSING DEVICE.—J. Ohring, San Francisco, Cal. No. 636,169. Dated Oct. 31, 1899. The object of this invention is to provide a device for readily opening and closing doors which are distant from the operator or inconvenient to be reached, such as street doors opening upon stairways leading to flats or rooms at some distance from the door. It consists of a latch-actuating lever, a rod extending upwardly therefrom, a weighted lever and connections between the outer end of the lever and the door whereby the raising of the lever will pull the door open and the dropping of it allows the door to be closed by the gravitation of the weight. A cord is operatively connected with the weighted or an equivalent lever and passes over guide pulleys by which it is led to the operating point and the latch-actuating rod is so connected that the first pull upon the cord disengages the latch and the further movement acts to pull the door open. When released the mechanism is such that the door closes automatically.

AIR HEATER.—E. R. Waterman and R. R. Morison of San Francisco, Cal. E. R. Waterman having assigned his interest to P. S. Regnart of same place. No. 636,090. Dated Oct. 31, 1899. This invention relates to an apparatus which is designed particularly for heating air, its object being to provide a convenient heater in conjunction with a nozzle through which a current of warm air may be directed into the cavity or upon the part where it is desired to use it and to so temper the heat of this air current as to prevent its unduly distressing the patient. It comprises an outer casing having a removable handle portion fitted to the rear end, an air-conducting pipe interior to the casing, a heater surrounding the pipe, a nozzle inserted in place through the rear end of the casing with an enlarged base flange to seat against the interior of the front end of the casing, and a connection through which air is delivered to the heating pipe. An electrical heater surrounds the air pipe, and a suitable insulating material prevents the escape of the electrical current. A non-heat conducting jacket surrounds the device.

FIRE ALARM SIGNAL CIRCUITS.—Wm. R. Hewitt, San Francisco, Cal. No. 636,139. Dated Oct. 31, 1899. This invention relates to such signal systems as have two independent series in each engine house operated alternately from a central fire alarm office. When a fire alarm is received at the central office it is first repeated over one of the lines called the "main tapper line," and then sent over the other called the "main gong line." Such an alarm would indicate the number of the station at which the fire department is due; but as all the companies do not respond to every alarm, but only to such as are within their own districts, it is desirable to relieve such companies from getting up at night when the call is not in their district. The device also prevents a failure of signals in case the watchman fails to properly manipulate the switches of the local circuit. The local circuit contains gongs, releasing devices, branch circuits having different closing contacts, and a switch in the local circuit is so arranged as not to be normally closed to the different closing contacts alternately, or to the said closing contacts simultaneously, and it is also so arranged as not to be opened at any position to all the closing contacts simultaneously. In conjunction with this is a "main tapper circuit," a branch circuit including one set of the closing contacts, a relay in the local circuit of the main tapper circuit adapted to close the branch circuit. A second branch circuit includes another set of closing contacts and a main gong circuit and relay which is adapted to close the second branch circuit.

Propeller Pump on the American River, Cal.

(Continued from Page 541.)

As the water recedes the bottom is excavated, until the whole length of from 10 to 15 feet is extended, when, in a few minutes, it may be removed and another section of casing put on from the bottom by flange joint connection and shafting with screws and guides added from the head of the pump; the whole operation taking but a few minutes time, when the pump may be speeded up to lower the water coming in during the slight delay.

The principle of the pump is that the water is lifted by screws, and the guides are arranged to deliver the water from one screw to another after it has been thrown the economic distance of which the screws are capable—about five feet. The work and the pressure are equally divided among the several screws, the weight being supported from the head by roller or ball bearings. The speed of this pump is the same for all depths for a particular amount of water. An increase of speed increases the capacity of the pump, and, by a lowering of speed, the capacity of one of these No. 10's, the size here shown, may be reduced from 2600 gallons per minute, to accomodate the inflow, however small. This wide range of capacity is a very important feature and is a requirement that is met in many mines, and a pumping plant for mines should be capable of handling more water than the estimated maximum flowing into the shaft, so that any increase of inflow may be handled without resorting to bailing.

The water at Missouri Bar carried considerable quantities of fine sharp sand and some gravel, but this pump handled the work without any repair being made during the season. The parts are simple and interchangable, no valves are used in the pump, and there are no exposed bearings; any needed repairs can be made quickly and at small expense.

L. G. Harrison, general agent for the Pacific coast, 31 Main street, San Francisco, Cal., has one of these Wood's propeller pumps in practical operation at his establishment. His exhibit is an interesting one and he will be pleased to explain anything connected therewith to anyone interested in handling water. These pumps are not dependent upon suction, for any time the water recedes more shafting and runners may be added from the top or bottom. No priming is required, it being only necessary that the bottom runner or screw be in the water when starting, and the admission of air does not cause a loss of the water. They take up but small space in a shaft, or in wells without pit being dug to water lever, and may be operated on an incline or vertically.

This pump is the invention of P. K. Wood, of Los Angeles, Cal., who is the manufacturer.

American Steel & Wire Co.'s California State Fair Exhibit.

(Continued from Page 541.)

phone. When we fly great kites for scientific purposes we often use wire for a string, and we could not explore the depths of the sea without wire sounding lines. We fence our fields with wire and nail our houses with wire nails. This last use for wire is comparatively new, but it is probably now the largest one that exists. The wire nail was invented abroad. Twenty years or so ago the only places where it was seen in this country were in foreign packing boxes, in accordions and cigar boxes. These nails were all made of iron, with thin, flat heads, which were usually very ragged about the edges. The nails or heads in general use then were of square sections cut from strips of iron. To-day the cut nail has almost disappeared from general use and has been replaced by the wire nail. To drive a nail, when the tapered cut nail was the only one to be had, was an art which it was said a woman could never acquire, but any one can drive a wire nail. The way in which the wire nail has displaced the cut nail is shown in these figures: In 1866, out of a total production of 8,760,000 kegs, only 600,000 kegs, or 6.9% were made of wire. In 1896 the total production was 6,335,730 kegs, and of these, 4,719,800 kegs were wire nails, or 73.5%. Each keg weighs 100 pounds, so that of the 2,000,000,000 pounds of wire made, this industry alone consumed 633,573,000 pounds, or about one-third. Another third is used for making barbed or plain fence wires, the other third going into the innumerable manufacturers of the country, from the material which forms the hook that enables the fisherman to take his prey, to the bicycle spoke or the vibrating cords of the piano or mandolin. Without wire we could not card our wool or cotton to prepare it for shipping, nor make a loom to weave it into cloth. To-day even the largest cannons are built of wire, and England has already got a number of big guns in service made of this material, which have proved themselves far superior in many ways to those made of more solid sections. No dynamos, motors or other electrical instruments of any kind could be made without wire. The strongest of all the wires made is that for pianos and other musical instruments. This is of fine steel, and tempered, and it is calculated to be able to resist a strain of 424,000 pounds to the square inch of section.

The wire cloth makers, who make all kinds of fabrics, from mosquito netting to fence cloth with meshes six or eight inches square, use enormous quantities of wire, and another great quantity is used in making the spiral springs which are used in all kinds of upholstered furniture.

The general manner of making wire is first to roll the rods down to a convenient size for handling, and then, after tapering an end, to pass the rods through tapered holes in a plate, which grow successively smaller and smaller. The wire is drawn through these holes by means of tongs, which grip the tapered ends, and then it is wound on reels. The drawing hardens the material, and it has to be annealed at frequent intervals by heating. In drawing very fine wires of gold or silver or other precious metals, the draw holes are often drilled through diamonds or rubies, and the making of these plates is a special industry.

There are more than 1000 sizes of wire made, ranging in measurement from the minimum of one-thousandth of an inch in diameter.

This great output of a million tons of wire in the United States is practically all manufactured by the various mills of the American Steel & Wire Co. This company comprises some forty-two mills, located in the most advantageous manufacturing districts of the United States, and the American Steel & Wire Co. say that their product is vastly greater than that of any other company in the world. They lead all other wire manufacturing concerns in the world as regards the volume of their output and variety and extent of their manufactures, which comprise wire of every description, and everything made from wire—barbed wire, plain wires of every description, field fencing, poultry netting, wire ropes and cables for logging and mining, street railways, tramways, ropeways, etc., copper and insulated wires for electric light and power companies, electric street railways, telephone and telegraph companies.

In addition to the wire products proper produced by this company, they also manufacture a great many specialties, such as the Schoenberger horseshoes, Shoenberger boiler plates and sheet steel, Cleveland cold-rolled shafting, chain of every description, double pointed tacks; in fact, their line is so extensive that it is one of the greatest manufacturing institutions in the world. Their trade compasses every part of the United States, as well as North and South America, and they are making extensive shipments to all foreign countries, China, Japan, Australia, Java, Turkey, England and the Continent, as well as to St. Petersburg and Vladivostock, Russia.

The American Steel & Wire Company maintain an important manufacturing industry on the Pacific coast, their factory here being known as the Pacific Works, covering over two and one-half acres of ground located between Bay, Powell, Mason and North Point streets, in San Francisco. Their general sales offices are at Nos. 8 and 10 Pine street, San Francisco, and their branch sales agencies are located at No. 201 North Los Angeles street, Los Angeles, Cal.; 231 to 235 Pine street, Portland, Oregon; 108 West Washington street, Dexter Horton Bank Building, Seattle, Washington; and at Spokane Falls, Washington; Butte, Montana; and Salt Lake City, Utah. This company is one of the most enterprising and progressive business institutions on the Pacific coast, and are doing a great deal to assist in the development of the local manufacturing interests, as their products are largely manufactured and supplied from the Pacific Works, in San Francisco. The enterprise and facilities of this great company were well illustrated by the magnificent display of their varied products which is shown on the first page of this issue. This display was the most complete and extensive of manufactured products ever made at the State Fair at Sacramento, and was the center of attraction to the many thousand visitors to this year's State Fair. The display was thought so highly of that it received the grand gold medal for the most complete and artistic display, and in addition was also awarded five other gold medals and awards of merit for individual lines.

The policy of this company is broad-guage and progressive, their treatment of their patrons fair and reasonable, and they will be glad to have anyone interested in the subject of wire or wire products call upon them at any of their sales agencies, where they will be furnished full information regarding wire products, and accorded all courtesies possible in supplying their requirements.

In addition to their display at the State Fair in Sacramento, this company also made extensive displays of their products at the Mechanics' Fair in San Francisco, where they also received the first award of merit; at the Humboldt County Fair in Eureka, Cal.; at the State Fair in Salem, Oregon; at the Portland, Oregon, Exposition, and the Spokane Falls Exposition, at all of which places their exhibits were the center of attraction, and received much commendation from the visitors for their completeness and excellence, as well as the many interesting features in the displays.

Mameva Mining & Milling Co.'s Property.

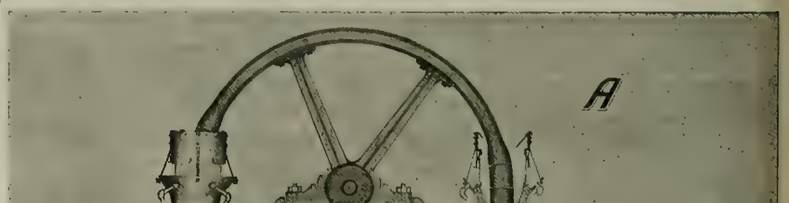
The property of the Mameva Mining & Milling Co. of Pittsburg, Pa., embraces five claims, located in the Mameva mining district, Inyo county, Cal., bounded as follows: "Commencing at Twelve-mile spring, in Inyo county, Cal., and running northeast to the State line of Nevada, thence northerly along the State line to Stewart's Holes, thence westerly to the Armagosa, thence southerly to line opposite Twelve-mile spring, thence southeasterly to Twelve-mile spring."

H. Wisener Hammond, the secretary of the company, says: "We have been operating only a few months, with a force of from four to seven men, and an idea of the conditions existing at present can be had from the following description by our superintendent, Mr. Baxter, under date of Sept. 16th:"

"The Lookout mine is a carbonate mine, with an iron gangue, and the ore assays as high as 71% lead, $4 gold, 21 ounces silver and 12% copper. The formation is dolomite, lying on quartzite and slate, making the quartzite the foot wall and the lime the hanging; in reality, a contact. The ore occurs in caves, with an iron casing, crops for over 50 feet in width, and in all appearance is like the Richmond mine, in Eureka, Nev., which declared dividends to the amount of $9,000,000. There is a tunnel in about 50 feet, with a crosscut 6 feet, showing ore both in the face of the drift and crosscut.

"South of, and adjoining the Lookout mine, is the Copper mine, lying right in the contact, between the lime and the quartzite, a small streak of which assays 214 ounces silver and 25% copper, and the ore crops to surface in different places for about 30 feet. There has been very little work done on this as yet, it being a continuation of the Lookout mine. Adjoining the Copper mine, on the east side, is the Chief, from which assays have been had running 6% copper, 5 ounces silver and $2 gold. This mine is situated wholly in the quartzite, and the croppings are fully 40 feet wide. South of the Copper and Chief mines is the Little Mamie mine. This mine we are working at present and are ready to ship ore. The ore is a carbonate and assays from 47 ounces silver, to 110 ounces silver, 6% copper with 61% lead. The vein can be traced the whole length of the location, and there is a tunnel in about 100 feet, with a crosscut 23 feet, and the ore is showing in the face of the drift. We are sinking on the ore, which is a very soft carbonate; and the ore is mixed with crystals, in the shape of a V, specimens of which can be seen at the office of the Mameva Mining & Milling Co., 1006-7 Park Bldg., Pittsburg, Pa. In all my experience in mining, which covers a period of twenty-five years, I have never seen anything like it—that is, to appear all in one shape, none of them being octagon, all flat—and they can be shoveled out with ore. East of the Little Mamie mine is the Contact mine, which is a gold mine with quartzite foot wall and lime hanging. There is no silver in this rock, and it carries $5 in gold, and cuts clear through the formation and can be traced the whole length of the location. The croppings are exactly like the famous Keystone mine, which assayed as high as $80,000 per ton in gold."

Tunnel in Little Mamie Mine, June 24th, '99, Mameva Mining District, Inyo Co., Cal.



Mr. Wisener continues; "While we will within the next sixty days ship a few cars of ore, it is our intention to continue development work, with a view of placing the property in the very highest physical condition possible before we ship extensively or erect a smelter. The crystals referred to in Mr Baxter's report have been assayed by the Pittsburg Testing Laboratory, showing no silver, copper nor gold, but 74.4% lead; being termed cerussite—carbonate of lead ore.

"A new assay from the Little Mamie, subsequent to Mr. Baxter's letter of Sept. 16th, shows .11 ounce gold, or 2.27 gold, $66 silver, 54% lead, 20% copper and 5% to 10% zinc. The lowest assay in copper in any of the ore from the Little Mamie mine (which mine has been more extensively worked than the others), shows 6.2% copper—which is considered very good, in view of the large amount of ore we are exposing in this particular mine. This is sulphide ore—wet. We have a fair tonnage of ore from the Lookout mine; this is principally a lead ore—wet—and is desired by a neighboring smelter for fluxing."

Under date of Nov. 10 the company wires that the net proceeds of a recent shipment to El Paso, Texas, of fifteen tons, unassorted, were $533.68.

The Ideal Stamp Mill.

Herewith is presented two illustrations of a stamp mill recently patented by A. C. Pratt, 1 Crocker Bldg., San Francisco, Cal. That marked A shows pitman connection for any power, and also gives outside view of one mortar and section of the other. The one marked B shows it with cylinder for direct application of steam.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

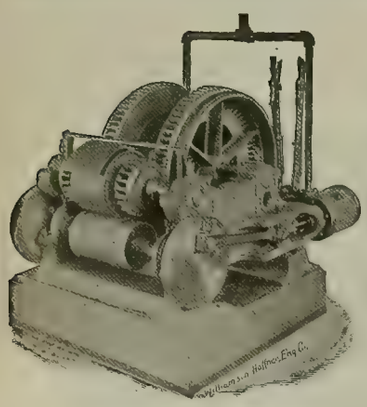
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

The above illustration shows an operator taking an incline above the horizontal with BRUNTON'S PATENT POCKET MINE TRANSIT. The instrument is made especially for mining engineers, mine managers and superintendents, but its light weight and the ease with which it can be handled render it admirably adapted to the taking of topography and for geological field work. Write for catalogue B, giving full description of the instrument and all its uses, to

No. 043 BUTTON BALANCE, 10-inch beam. Sensitive to 1-100 Milligramme. This is a double-column button balance with all latest improvements, including our new adjusting device and rider rod lock. It is accurate and as rapid as a beam of this length can be. For an office doing a moderate amount of work, it is the best balance to be had for both gold and silver. For complete description and prices of this and other balances send for catalogue A to
Wm. Ainsworth & Sons,
(Successors to Wm. Ainsworth.) Denver, Colo., U. S. A.

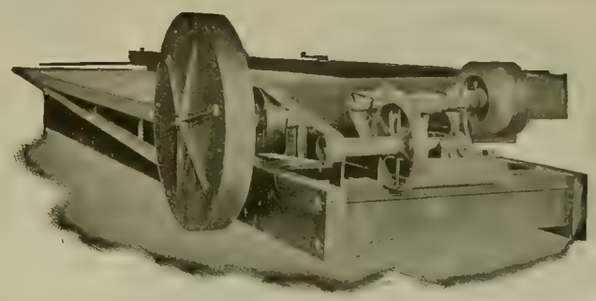
The Metropolitan Compound Mfg. Co.,
Office: 26 Court Street, Brooklyn, New York City.

"The Proof of the Pudding is in the Eating."

Something over a year ago, two of these Richards' Patent Triple Plunger Pumps, with motors as shown, were supplied to a mine in Mexico, for the purpose of raising water to an elevation of 650 feet. The owners were so well pleased, that they ordered another of the same a few months later. These pumps were arranged with outside packed plungers, for pumping muddy water — designed for that purpose, they did it satisfactorily.

For all purposes where a uniform resistance to the driving motor is a consideration, these pumps are admirably adapted. Triple Plungers and crank shafts run in a bath of oil if desired. Made with large valve areas, and by actual test develop a very high efficiency. Furnished with or without motors, or for use with gas or steam engine.



This is only one of over fifty different kinds of pumps we make.
Our 1899 Catalogue tells all about them; sent on application.

W. T. GARRATT & Co.
COR. FREMONT AND NATOMA STS.
San Francisco, Cal., U. S. A.

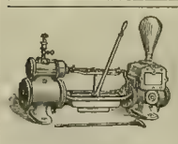
FRANCIS SMITH & CO.,
—MANUFACTURERS OF—
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
46 FREMONT STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with Asphaltum.

WHITE, ROGERS & CO.,
Contracting Engineers and Millwrights,
OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated
WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.



One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

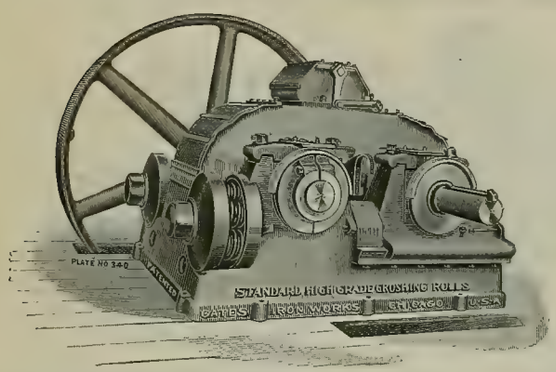
THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : : :



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Market Reports.

SAN FRANCISCO, Nov. 9, 1899.

SILVER.—London, 26 15-16d; New York, 58¼; San Francisco, 58⅜@58¼; Mexican Dollars, 47½@48½; New York exchange, sight, 10; telegraphic, 12½ cents premium.

LEAD.—New York reports quiet, $4.60 bid, $4.65 asked; brokers' price, $4.40.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6¾c.

COPPER.—New York reports Lake dull at $17; brokers' price, $17@17.50. Local—Mill copper plates, 23¾c.

An effort is being made to brace up the market for copper in America in sympathy with the firmer London tone, and Lake at 17c is not so much in evidence as a few days ago. London is buying heavily, and the continent is also reported to have made purchases lately, but the home trade is still waiting. The Calumet & Hecla has taken large orders which run into December at 18½c. The impression seems to be that copper will not go below 17c and may again go to 18c, or above it.

IRON.—American, soft, $24@25.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—11¼@20c per pound.

TIN.—Dull and easy, $29.75 bid and $30 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $50; export, $45@45.50; carload lots, special rates.

It is reported that the floating supply of quicksilver has now become practically exhausted, and another advance in prices is expected. The earnings of quicksilver properties are increasing in proportion to the advances in the metal. The opening of new mines and the rehabilitation of old ones have not as yet made any impression on the market.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

PLATINUM.—London, 66s per ounce; New York, $17.75; San Francisco, $17.25.

ZINC.—Dull and easy; $4.70 bid, $4.80 asked.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c ₱ lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5½@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@1¼c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5½c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8½c; 6s, 12 oz., 7½c; 6s, 10 oz., 6½c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd..	14 50	Welsh Anthracite.	12 50
Scotch	8 00	Rock Springs	7 60

COKE. — Foreign, $13; domestic, $12 per ton.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.20; less than 200 gals., $1.25; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 56c; cs., 66c; raw, bbl., 54c; cs., 59c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 19c; Astral, 19c; Star, 19c; Eocene, 21c; Extra Star, 23c; Elaine, 24c; Water White, bulk, in tanks, 13c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. SPECIAL ATTENTION TO MAIL ORDERS.

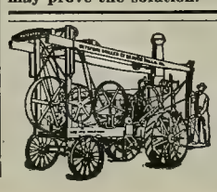
$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.

FIRTH'S DRILL STEEL, 16 cents per pound.

The best drill steel on the market. Has no equal for hard rock drilling. Miners cannot afford to use an inferior steel when FIRTH'S can be bought at the above price.



Abner Doble Company, Gen. Agts.,

Fremont and Howard Sts., SAN FRANCISCO, CAL.

Are You Confronted With a Difficult Ore-Separating Problem?

THE WETHERILL MAGNETIC SEPARATING PROCESS

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y

For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes. Unexcelled for lead and zinc testing.

KEYSTONE DRILLER CO., Beaver Falls, Pa.

Thousands of engineers can testify to their efficiency. We want your endorsement also. Buy a Lubricator from your jobber. We guarantee it to give perfect service or money refunded. Jobbers on Pacific coast sell them.

Gold Deposits in Georgia.

The Appalachian gold belt enters Georgia from the Carolinas and runs southwest to the State line. The greater part of the gold found occurs in the Dahlonega and Hall county belts. Both placer and vein mining are carried on in White county. In Lumpkin county is the richest part of the belt, and mining operations have been carried on since the opening of the first mine in 1829. The individual auriferous belts are generally made up of several veins or ore bodies, running more or less parallel with each other and conforming in dip and strike to the country rock, varying in thickness from a fraction of an inch to several feet. The so-called stratified deposits are of common occurrence, and are noted for great thickness. They are well represented at the Crown Mountain and Jumbo mines in the Dahlonega district. A typical example is at the Banner mine, Carroll county, where the ore body is of uniform size, formed of numerous layers of quartz separated by thin layers of schist, both the quartz and the schist being gold-bearing. The deposit there is 75 feet thick.

"HYDRAULIC" MINING IN THE DECOMPOSED AURIFEROUS SLATES, WITH THEIR VEIN CONTENTS, AT THE SINGLETON MINE, DAHLONEGA, GA.

Georgia gold ores are usually of low grade, free milling and sulphurets. The sulphuret ores are chiefly met below the water level and are mainly made up of white quartz, carrying auriferous pyrites.

Modern mining machinery is in use at many places in the State. In the Dahlonega district the greater part of the ore is obtained from saprolites, a term used to designate the decomposed ore bodies in place. The hydraulic giant is used in mining these ore bodies, which are the superficial oxidized portion of the "stratified deposits" or ore shoots. It is a cheap method. The ore is carried away from the giant by the rushing waters, caught up in the flume or sluice boxes, and conducted to the stamp mill. Deep mining is carried on only at the Creighton mine, the Royal, near Tallapoosa, and a few other mines. The chlorination process is used in the treatment of the low-grade sulphurets in these mines. There are a number of good properties in the State, near the Southern Railway, which are being developed.

The accompanying illustration at first view looks like an old-fashioned California giant at work in the Sierra foothills, but a closer inspection will show differences. One of the most interesting things about it is the fact that its use, as represented, is unique. It is not "hydraulic mining" as known in California, as the Georgia process is simply a cheap way of getting out the ore for reduction, a sort of combination of hydraulic and quartz mining not general on the Pacific coast.

TRACTION ENGINE AND LOAD IN THE SIERRA NEVADAS, CALIFORNIA.

Hauling Lumber with Traction Engines.

The powerful engine herewith portrayed, with its long train of heavily loaded wagons, is one of five outfits of this kind built by The Best Manufacturing Co. of San Leandro, Cal., for Towle Bros. Co. lumbering firm of Towles, Placer Co., Cal., who have had four of them in successful use for over seven years, hauling logs to their mills and lumber to the railroad station, taking the place of animal power, which they formerly used. These outfits are particularly adapted to haul freight of all kinds from out-of-the-way places. In many regions logging camps, saw mills and mines are situated from ten to forty miles, and sometimes much greater distance, from a railway,

It is stated in Eastern financial journals that large producers of copper in the Lake Superior region have purposely allowed the price of copper to decline to 17 cents for the purpose of discouraging small operations and mines producing on a very small margin of profit, in order that the price may be maintained at present prices.

Tutuila island of the Samoan group in the south Pacific, which by international agreement has fallen to the lot of the United States, is said to possess in Pago-Pago bay the best harbor in the south Pacific ocean, Pearl harbor in the Hawaiian group being considered next best. Tutuila island has an area of but fifty-four square miles and a population of 4000, and is not particularly valuable from a commercial standpoint; but, with the valuable harbor, it becomes of great value to the United States in consideration of increasing trans-Pacific trade.

A great many of the mines of the Witwatersrand, South Africa, are closed down, the richest being worked by the Boer Government with such skilled labor as they can command. The operation of these mines, mills and auxiliary plants had been reduced to a science. Careful attention had been given to every detail and the best managers and most skilled metallurgists and mining engineers employed. If, under the existing circumstances, the new managers can work those mines at a profit, it will be a matter of surprise to mining men.

In the Rossland, B. C., district the I. X. L. mine, with so-called free milling ore and a 10-stamp mill, presumably suited to the treatment of the ore, is shipping its ore to the smelters, it being stated that the cost of milling and the attendant loss of values are greater than the cost of treatment at the smelter. It would appear from this statement that either the ore is not free milling or that the mill work is not as efficient as it might be. Where an ore is free milling it can be treated in such a mill at a cost much below that of smelting silicious ore anywhere. Much of the rich gold ore of Cripple Creek district of Colorado goes to smelters, but the telluride ores of that district are not, strictly speaking, free milling.

Stock Gambling vs. Mining.

A depreciation in the price of copper may have the effect of checking the demand for copper mines and prospects and turn the attention of investors to gold mines once more, for since the copper boom promising gold properties have been largely overlooked. Those seeking investment in mines should always consider carefully not only the present but the future prospect. Copper is never stationary in price for any great length of time, but gold is always worth $20.6718 for each ounce of the pure metal. A few months ago 15 cents per pound was considered a high price for copper, but it went above it, and the rush for copper mines, copper prospects and copper stocks indicated the public confidence that the high price would last for all time, or at any rate until a fortune could be made. Now the price is falling and copper stocks are falling with it, and those who bought in at or near top figures are losing their money and condemning mining as an investment. There is little use in warning those who make these ventures, for if they did not gamble in high-priced copper stocks they would risk their money in other enterprises equally uncertain, but their loud complaint at the loss of their money in mines deters others who would otherwise invest on a rational business-like basis from making any investment at all, and legitimate mining gets a setback. For many years mining suffered from the effect of speculation and ill-advised investment and a period of depression followed, during which the industry secured a firm foothold, depending upon merit alone, and has come to be looked upon as a legitimate business offering greater profits for investment than any other industry, but an era of wild speculation in which many lose fortunes is almost certain to have a reactionary effect and for the good of the mining industry at large it is better to see copper settle slowly downward to a reasonable price than see it advance to 20 cents. Competitive metals will cause it naturally to seek its proper level in the commercial world. The investment of money in a bona fide mining operation, the management of which is in the hands of competent and experienced men, is as safe an investment as one can make in any business offering a possible large return for capital invested, but the investment of money in the high-priced stocks of mines in the management of which the investor has not only no voice but little knowledge of existing conditions is quite another thing.

The high price of tin and quicksilver is stimulating prospecting for the ores of those metals, with the result that numerous discoveries of cinnabar have been made, and deposits of low-grade ore, long known, are being opened; but prospectors, generally being less familiar with tin ores, have not met with great success in finding tin deposits. In the Black Hills of South Dakota are many tin-bearing veins, and although a large amount of money has been spent in the development and equipment of these vein mines, thus far a commercial success has not resulted. In the streams adjacent to the tin mines, both in the Harney Peak region and in the Nigger Hill district, on the Wyoming line, there are large quantities of tin stone, which can be recovered by sluicing operations. In each of these districts gold also occurs, particularly in the creeks of the Nigger Hill country, and in working these in the early days of mining in the Black Hills, the black sand which constantly and abundantly accumulated in the sluice boxes was the bane of the miners, who dumped it out into the gulch again. This black sand is largely made up of wolframite, columbite and other rare iron ores, with a considerable amount of cassiterite. It seems strange that placer miners of those districts do not take proper steps to recover these valuable minerals from the gulches by the simple and inexpensive method of sluicing, and then subjecting the minerals thus obtained to a more careful separation for the market.

The success achieved by the Home Mining Co. of Leadville, Colo., in reopening the flooded idle mines of the lower portion of that district, when outside capital feared to invest, has stimulated others to emulate their example, and the organization of a second home company is now talked of in Leadville. Those who reside at the mines should know their true worth better than others, and there are many places where home mining companies, organized to develop new mines or open old ones, would give greater confidence in the mines to others residing outside the district. These local companies not only show the confidence which those residing at the mines have in them, but are also an index of the progressiveness and energetic character of the camp.

Cheap Deception.

Among other foolish practises which of late have become particularly noticeable is the reporting of the sale of mining property in the prospective stage of development at large figures. A copper prospect previously unknown and unheard of is this week announced sold for $700,000; another, a gold prospect, for $300,000. Frequently these "sales" pass the million dollar mark. There can be but one object in making these false statements, and that is to give to the property an apparent value which it does not possess, and is as bad as representing it to have large and valuable ore bodies which do not exist. These so-called sales are in most instances merely contracts to sell or buy, not binding on either side, and the actual price is usually one-tenth, one-twentieth or even one-hundredth of the price stated to the public. In most cases it is the intention of the promoter to organize a corporation and to put the property in at the price stated, generously not increasing it. The investor in such stock must necessarily buy on an inflated valuation and his chance of ever getting even, to say nothing of making anything from his investment, is very small. Since the war tax has required stamps to be affixed to these documents some have even resorted to this cheap method of deception, putting a greater number of stamps on the instrument than the transaction actually demands, carrying the impression that a large sum of money was paid for the property. These small frauds may serve their purpose in some cases, but a careful, discriminating public will in most cases understand the situation and not be deceived into believing either all they hear or see.

Some time ago was stated herein at some length that this paper does not sell space in its reading columns; that whatever is printed in these columns is printed free, no matter whom it may benefit or advertise; that the criterion by which it is judged is its interest to our readers, and that if it meets this standard it will be given space in our reading columns for nothing, and that if it does not, it will not be inserted at any price. It appears that the London *Mining Journal* is run on the same broad-gauge plan. It received a "puff" of a gold mining company with instructions to publish it as news at a stipulated price. The *Journal* somewhat indignantly published the proffer, and the notice itself, greatly to the distress of the West Rand Central Gold Mining Company, whose plans were thus exposed. The company's promoter writes the *Journal*, saying that such publication of its pecuniary proffer was "a great breach of confidence." The *Journal* answers, taking the correct and unanswerable stand that its first duty is to its readers and the public. The Mining and Scientific Press congratulates its English contemporary on its courage and public spirit in refusing to sell its reading columns, and is constrained to further say that such action is in honorable contrast to some mining and financial journals who betray whatever public confidence may be reposed in them by asking and taking so much per line for what would not otherwise appear, and what is ofttimes fraudulent and deceptive.

The only way to view advertising is as a business proposition, a cash investment for publicity and profit. The buyer of advertising space should know just what he is getting, how many copies of the paper are printed, where they go, the kind of people they go to. Knowing that, if he deems the medium of value to him he would do well to advertise in it; otherwise, not. Business is simply the systematic supplying of wants, that's all. If a business man has a good article it is business to create a demand for it by proper announcement in the journal most likely to reach those to whom he looks for business.

Concentrates.

THE number of this issue printed is 8856 copies.

ASTRONOMERS say that the earth receives only the one two-billionth part of the heat of the sun.

UP to this date more than 3000 miles of new railway have been built in 1899 in the United States.

THE silver production of the world in 1898 was 165,295,572 ounces; it was 164,073,172 ounces in 1897 and 157,061,370 ounces in 1896.

IN '93 J. H. Hammond was paid $20,000 per year in South Africa by Barnato Bros., Mr. Conners, $12,000 per year; Mr. Clements, $6000.

THE average density of the earth is 5.505, water =1. This would make the total weight of the planet 5,690 trillions of tons (of 1000 kilo).

HOUGHTON COUNTY, MICHIGAN, in which are the largest copper mines in the Lake Superior region, gives employment to more than 13,000 men.

ANCIENT river channels, such as are found in California capped with lava, are subject to location under the laws governing the location of placers.

A LACK of knowledge of the lines bounding the mill site or claim lines is the misfortune of the claim owner, who is supposed to know where his lines are.

SOUTH AFRICAN gold bullion produced by the cyanide process varies widely in value, from .675 to .995 fine; an average would, probably, be about .825 fine.

OF the eighteen explosives in the "permitted list," seven have nitro-glycerine as their base; the other eleven have ammonium nitrate. Cordite contains 5% of vaseline.

DIAMOND DRILLS have recently been advantageously employed in making connection between drainage tunnels and flooded shafts sunk from the surface at Creede, Colorado.

AN assayer in the State of Nevada is required by law to place a written description pasted on or stamped upon every bar of bullion or amalgam melted, retorted, assayed or refined by him.

IN shaft measurement and mine surveying generally an iron plummet is liable under certain circumstances to cause error which may in all cases be obviated by the use of a brass plummet.

"ENCLOSED find three dollars for a renewal of my subscription to the best mining paper published" is the way a mining engineer of world-wide fame expresses his opinion under date of the 5th inst.

WHERE it can be shown that work done in a tunnel is for the benefit or development of adjoining claims constituting a group, work so performed may be made to apply as assessment on the adjoining claims.

A SIPHON tube 4 inches diameter, length of line 1760 feet, greatest altitude of siphon 15 feet above intake, and 52 feet above discharge orifice, will give an average discharge of 490 gallons water per hour.

IRON as used commercially is never "pure." It is a mixture of other elements and iron. Pure iron can be produced chemically. Piano wire is probably the purest form of iron in use—99.7% pure, 0.3% carbon.

AUSTRALIA produces more gold now than at any time in her history. Of this a large proportion comes from the desert of Western Australia, where all the water is salt and life is largely one of constant hardship.

SAND floats on water because of capillary attraction, the surface tension of the water enabling it to form a depression somewhat larger than the particle, resulting the same as if the specific gravity of the dust particle had been decreased.

THE non-use of a water right is not an abandonment, though long continuance of such non-use argues an intention to abandon. Abandonment is a question of intention, and whatever clearly shows that intent is fair evidence either way.

THE output of the mines of the Witwatersrand for the month of September was 411,962 ounces, making a total for 1899 to Oct. 1 of 3,913,840 ounces, which is more than two and a half times as great as the output for the same months during 1896.

ANY photographic flashlight powder containing potassium chlorate or perchlorate is dangerous. Great caution is requisite in the preparation and use of ordinary flashlight powders, and none but an experienced person should attempt to mix or use them.

THOMAS EDISON JR. is now credited with declaring that successful telephoning across the Atlantic will soon be an accomplished fact. Thos. Edison Sr. says that such an "accomplished fact" will require for its accomplishment a stronger force than electricity.

THE softer the iron the better for field magnets of dynamos, or of motors, or cores of armatures. A motor's armature is more likely to burn out when going slow than when at high speed. The resistance of an armature wound with 1500 feet of No. 26 wire is about 16 ohms.

WORK done on a patented claim for the benefit or development of adjoining claims (unpatented) may apply as assessment or such adjoining claims: one hundred dollars worth of work on improvements being made on the patented claim for each unpatented claim in the group.

THE idea that a mineral vein must be a "true fissure," having "well-defined walls," with "gouge seams," and lie "between walls of different character," is disappearing, and anything that contains pay is considered to be the vein, whether the walls are in evidence or not.

PROBABLY "the cheapest hydraulic mining ever reported" was that at the North Bloomfield, Nevada Co., Cal., some years ago, where, according to the superintendent's statement, the entire cost averaged 2 cents per cubic yard of material removed—about 1 cent per ton.

ANSWERING F., Ouray, Col.: magnetic iron ore containing 75% iron would be a rarity; 72% is about the limit of the best. It is suggested that samples be submitted to steel and iron companies of Colorado and the East. It is possible that transportation charges would absorb what would be profit in a property more favorably situated.

GOLD occurs in gypsum at Lake Austin, Murchison, West Australia, where, in a conglomerate of metamorphosed rocks, diorite and quartz, cemented by gypsum and oxide of iron, has been found free gold from a color up to pieces of 28 dwts. The deposit appears to be lacustrine.

CRYOLITE is a fluoride of aluminum and sodium, contains from 8% to 14% aluminum, is found in gneiss in Utah, Colorado and Greenland, where it occurs in huge bedded deposits, mined in masses from an open cut, and run direct into the holds of vessels for shipment to the Atlantic States and Europe.

ANY difference in voltage between a dynamo with electro field magnets and the same with permanent field magnets is due to higher intensity of magnetic field. In the electro-magnet higher intensity is produced, which can be compensated for by using larger permanent magnets, so that the voltage can be brought up to any desired point.

A GERMAN scientist at Berlin has announced the discovery of a new planet in the solar system, which is revolving about the sun in an elliptical orbit between the earth and Mars, its period of revolution being 645 days. This is presumed to be a new planet whose appearance is accounted for by some disturbing influence of some large planet.

THE name of no successful gold-smelting electrical process occurs to the writer. Numerous laboratory experiments have been pronounced successful, and in several cases the idea has so far advanced commercially as to occasion successful sale of stock in such proposed enterprise. There are, however, several eminently successful electrical gold-refining processes of proved commercial value.

THE flame of an ordinary candle or lamp is extinguished by a mixture containing 16 5% oxygen and 83.5% extinctive gases. A flame of coal gas requires for its extinction a mixture containing 11.3% oxygen and 88.7% extinctive gases. Air expired from the lungs is of the same composition as that which extinguishes the flame of an ordinary candle or lamp. Air may be breathed until its oxygen is reduced to 10%.

THE Santa Ana, Cal., electrical transmission plant carries 33,000 volts eighty-one miles. The Michigan proposition is to exceed this, the intent being to transmit 40,000 volts ninety miles—from a dam with a 23-foot head to Jackson. The generator connected direct to the turbine shafting is a three-phase alternating current dynamo; its voltage on full load is 2300; its rated capacity in amperes on each phase is 377; its rated H. P. is 2700. It weighs fifty tons and rests upon a concrete foundation.

FIRES originating near steam or hot air pipes have been attributed to the partial charring of the wood or fibrous dust by the heat and its absorption of oxygen from the air. Oily waste and rags used for cleaning machinery are the most fruitful sources of spontaneous combustion, and journal drippings with accumulations of dust are a source of danger. Sawdust packed in barrels or boxes when wet may cause a fire. As in other cases, intelligent attention and constant watchfulness are necessary.

BEYOND the violet end of the solar spectrum there is a whole gamut of invisible rays which only reveal themselves by their effect in promoting chemical action; and, similarly, beyond the other end of the visible scale, the deep red, there is a gamut of invisible or dark rays which are only perceptible by their heating effect. Regarding the former the photographic plate has developed some new facts, and the bolometer has similarly indicated absorption lines in the great invisible spectrum that lies beyond the red.

NEARLY every establishment furnishing mining machinery has one or more trusted, experienced men, practical mining engineers, who know what is needed in special cases or general requirements, and who can see that anything needed, large or small, from a stamp shoe to a complete plant, is properly furnished. Such men can install any required machinery and their advice and aid are of value, and in all cases where a mine needs machinery of any kind those in charge of the mine would do well to have a talk with such a man.

WHEN an ore deposit occurs in a massive rock like granite, porphyry of any kind, felsite, andesite, etc., and there is found an extensive crushing of the country rock along and including the vein, crosscuts are of utmost importance, for the best defined wall often proves to be merely a plane of fracture within the mineralized zone, beyond which pay ore may be again found; and because a crosscut in one portion of the mine is without result, should not deter the management from making others elsewhere. Crosscutting should be carried on systematically in view of this condition.

PETROLEUM may be rendered uninflammable: to 250 gallons of petroleum add 550 pounds of common salt; heat the mixture to 100° C., when may be collected about sixty gallons of volatile and very inflammable hydrocarbon—benzine. The remaining petroleum is not inflammable below 100° C., and its illuminating power is increased. Were the 190 gallons of residue added to 375 gallons of crude petroleum, the mixture heated for one hour to 100° C., then cooled to 40° C., the first resultant sixty gallons benzine added, the whole again heated to 82° C., the fuel thus obtained would not be inflammable below 75° C.

IT is kindly suggested to many of our exchanges that occasional credit for matter reprinted from this paper would be appreciated. It is not infrequent to notice nearly the whole of this page reproduced without a single line of credit, and while of course it is gratifying to have technical matter that is prepared at considerable cost and research so evidently appreciated as to be copied wholesale, yet probably our appreciative Eastern and Canadian friends who so universally appropriate items to their own columns will agree with us in the suggestion that it would look better to at least occasionally credit the original source.

WHERE an assay of an ore gives gold .57 oz. and silver 1.03 oz. it is not likely that the same ratio of gold to silver would be found in bullion resulting from the treatment of such ore, as the probability is the gold would be relatively higher than the silver. In the event, however, of such a saving the fineness is found by simple proportion. The fineness of silver or gold contents of bullion is always written in thousandths, which expresses so many parts of silver or gold in 1000 which the bullion contains. .57+1.03 oz. =1.60 oz. Thus as 1.60 : .57 : : 1000 : 356.25= the gold fineness; 1000—356.25=643.75 the silver fineness. Ordinarily the fractional fineness is omitted.

UNDER no conditions should blasting powder be placed on hot steam pipes, or steam boilers, or on or in a hot stove, or any hot metal. Nor should it be exposed to radiated or reflected heat from a fire of any kind. It should be kept away from the blacksmith's forge or shop, and should not be roasted, toasted or baked in any way. (Sometimes a "Concentrate" occasions a smile from some old, experienced miner, but he should remember that thousands are yearly beginning, and a pointer that is unnecessary to him is of as much value to many as it was to him when he first began. If he will remember the number of good men that he has seen hurt by monkeying with powder he will be glad to note a word of caution that may save some fellow-miner's life.)

THOUGH a wet season, the usual November stories of singular gold finds are late. The Douglas Co., Oregon goose with a $5 nugget in its crop, the Klickitat, Wash., salmon with a similar amount in its stomach and the Rossland, British Columbia, fir tree whose ashes assayed $17.43 "to the ton" are as voiceless in '99 as the lost desert mines beyond Mojave, Cal., or the "white gold worth $31.75 per ounce," once so prevalently reported from Yuma, Arizona. The only recent noticeable effort in this regard is from Redding, Cal., where last week a hotel cook found a "magnificent pearl" in the gizzard of a chicken he was dissecting. The former chroniclers of strange mineral manifestations in bird and beast seem to be now more lucratively engaged in writing oil prospectuses.

IN the case of a man with an assayer's certificate of the assay value of his ore, concentrates and tailings, and wanting to know how many tons had been put into one, a general rule may be deduced, viz.: From the assay value per ton of ore and of headings, respectively, subtract the assay value per ton of tailings: divide the lesser remainder by the greater: the quotient represents the "number of tons put into one." Ore containing free gold amalgamated in batteries or on plates should have the sample for ore assay taken from the pulp delivered to the concentrators. The assay value of the original ore may then be known by dividing the value of the amalgam by the number of tons crushed, and adding the result to that found by the assay of the pulp going to the concentrators, probably securing as accurate a result as sampling from the rock breaker.

THE controlling factor in the successful operation of a quarry is the market price of the stone, rather than its intrinsic value. Builders and contractors may not be familiar with qualities of stone that made it suitable for their purpose. Poor economy sometimes occasions the use of inferior material in an attempt to cheapen the cost. The actual cost of stone dressed ready for use depends upon the ease of quarrying in blocks of the form required, the facility with which the stone can be dressed, and the cost of transportation. The price of the stone will be further determined by its beauty, susceptibility of fine finish, and its established reputation. Whether the stone shall be sold in the rough, or dressed, depends upon which brings its owner the largest profit. A large part of the actual cost value of a stone is the labor put on it; a good part of its sale value is its reputation.

IN the event of a mining company or corporation neglecting or failing to perform the assessment work on unpatented mining claims, the locations revert to the Government, again becoming a part of the public domain, and are subject to relocation by any person whether a stockholder or not. If, however, the stockholder should have held a fiduciary position—as president, secretary or manager of the company or any other position which would have given him knowledge of the company's affairs of a confidential nature—the court may hold that he has relocated the property as trustee and for the benefit of all stockholders. All depends upon the prior relation which the stockholder may have had with the company in an official way. This is in answer to four different questions—E. G. T., Bisbee, Arizona; L. L. Y., Butte, Montana; J. P., San Francisco, Cal., and O. F. M., Colorado Springs, Colo.

IN the case of McShane vs. Kenkle, (44 Pacific Reporter, 979), Supreme Court of Montana, the court held that: "Under the laws of the United States (Sec. 2320), providing that no location of a mining claim shall be made until the discovery of a vein or lode within the limits of the claim located, it is the finding of mineral in the rock therein that constitutes the discovery, and it is not necessary that the vein or lode should contain mineral of such a nature that a practical miner, if he encountered it, would feel justified in following it up with the reasonable expectation of finding paying mineral. Nor is it required, under the statute, that the paying mineral necessary to justify the location of the claim should be found at the time and place of discovery; but it is sufficient if the development of the vein showed that paying mineral exists within the limits of the location. It never was intended that the locator of a mining claim should determine all the facts before he would be entitled to a valid location."

CONCERNING the disposition and ownership of tailings, "Lindley on Mines" says, Sec. 426: "To suffer tailings to flow where they list, without obstructions to confine them, is equivalent to their abandonment. If they lodge on the lands of another they are considered an accretion, and belong to him. If they accumulate on vacant and unappropriated public land, it has been the custom in the mining regions of the West to recognize the right of the first comer to appropriate them by proceedings analogous to the location of placer claims. As was said by the Supreme Court of Nevada: 'Although not a mining claim within the strict meaning of the expression as generally used in this country, a tailings claim is so closely analogous to it that the propriety of subjecting the acquisition and maintenance of the possession of it to the rules governing the acquisition of the right to a strictly mining claim at once suggests itself.' The Land Department has recognized this possessory right and permitted entries to be made of lands containing beds of tailings, under the laws applicable to placers. There are no adjudicated cases in the reports of department decisions which have come under our observation; but we have knowledge of several instances where patents for this class of claims have been issued under the mining laws."

A Railroad to the Klondike.

When the big "rush" to the Klondike took place two years ago the attendant horrors of the Chilcoot pass and the extraordinary cost of transportation made it manifest that the kind of men who made railroads before wagon roads in other mining regions would not long wait upon the difficulties in getting toward the new El Dorado, but would throw them aside. Accordingly a wire rope tramway was built, and that in turn superseded by a railway, now in daily operation between Skaguay and Bennett, a distance of forty-one miles. The engravings on this and the opposite page illustrate the general appearance of the country through which passes the White Pass & Yukon route, though the scenes herewith presented could be duplicated in California, Colorado, Utah, or Montana. Under date of October 10th the traffic manager writes: "We have now a large number of men constructing the road from Bennett to White Horse, a distance of 110 miles from Skaguay, and we have every reason to believe we will be operating trains over the second division by June 10th, 1900. Upon the completion of our tracks to Lower White Horse by June 10th, and after the opening of navigation of the rivers, the schedule time from Puget Sound and British Columbia ports to Dawson will no doubt be about eight days."

A RAILROAD TO THE KLONDIKE—WHITE PASS & YUKON ROUTE.

The Wentworth Cyanide Plant, Lucknow, N. S. W.

The plant recently built at the Lucknow mines is a slimes plant, and is the result of a series of experiments in agitation methods conducted by Henry Watson, the cyanide manager. After trying compressed air, revolving barrels, and other methods, Mr. Watson came to the conclusion that arms revolving on a central spindle, with bafflers fixed on to the inside of the tank, was the most perfect method of agitation. Without the bafflers the agitation would not be so complete, as the motion would be centrifugal, but with the bafflers the swirl of pump is thrown back from the sides of the tank and an intimate mixture of all the particles is effected. It was thought the slimes would settle in the tank sufficiently fast to dispense with artificial means of filtering, and this is the case when the tanks are filled with the pumped-up mixture of slimes and water, the rate of settling then being 1 foot per hour, but after a six hours agitation with cyanide the time is so long that filter presses will have to be used. The slimes are deposited in a bed so coherent and plastic as to resemble putty and are absolutely impervious to water. They consist of calcite with kaolin, and kaolin forms the finest portion of it, being so fine that when mixed with water and filtered through Swedish filtering paper the filtrate is milky. The slimes are broken up by being thrown into a revolving trommel, with water fed in. The trommel is set in a large wooden tank, and when the sludge is sufficiently thick it is pumped up by a centrifugal pump to the launder communicating with the tanks. In the tanks it is allowed to settle, and the supernatant water is syphoned off to a pipe whence

LOOKING UP THE EAST FORK OF THE SKAGUAY RIVER—WHITE PASS & YUKON ROUTE.

ON THE WAY FROM SKAGUAY, ALASKA, TO LAKE BENNETT, B. C.—WHITE PASS & YUKON ROUTE.

CROSSING THE DIVIDE—WHITE PASS & YUKON ROUTE.

it runs back to the trommel tank; then the agitating tank is filled again, and the process continued until the tank is filled with fairly thick sludge. A sample is taken by running a 1-inch iron pipe into the mass, closing the top end of the pipe with a screw cap and withdrawing. The sample is assayed for total solids, water and gold contents, and from this the amount of cyanide necessary is calculated. It will be seen that more calculation is necessary with wet slimes than with dry, as with dry slimes the cyanide solutions can be run on without calculation, but with wet slimes the amount of water present must be taken into consideration. The gearing for the tanks is the ordinary cog-gearing with clutch and lever motion, as used in precipitation tanks in the Russell process for silver ores. The cyanide liquors are syphoned off to a pipe which communicates with the filter tank, this filter tank being composed of a wire sieve bearing a layer of sand and a filter cloth. The filter cloth is loose and is kept in position by a wooden frame, but it can easily be removed when choked, and cleansed by washing. The filtration is helped by a steam ejector, and the filtered solutions are pumped by this ejector to the collecting vats. From the collecting vats the solutions pass to the charcoal filters, of which there are 24. These filters are of sheet iron. It is calculated that the charcoal in these boxes is sufficient for 490 tons of liquors. From the boxes the liquors pass to a sump tank, whence they are pumped up to the weak solution tank. The measurement of the tanks are: Strong solution tank, 12 feet 6 inches by 6 feet; weak solution tank, 12 feet 6 inches by 6 feet; five agitation tanks, 12 feet 6 inches diameter by 7 feet deep; one sump tank, 12 feet 6 inches diameter by 6 feet deep. Collecting tanks—there are two of 5 feet by 4 feet by 4 feet; these are only temporary, pending the installation of a 12 feet 6 inches diameter by 6 feet. The agitation tanks take about 21 tons of water and slimes. The extraction of the gold is 90%. The average value of the slimes is 8 dwt., but the contents vary from 4 dwt. to 1 oz. The total quantity of tailings is 200,000 tons, which, at 8 dwt. per ton, would give 80,000 oz. of bullion, at £3 10s. per oz., or a total of £280,000. —Melbourne Mining Standard.

An Indicator for Hoisting Speed.

An ingenious machine is employed for measuring the velocity of a hoisting engine recently inserted at the Skalley Shaft No. 2 of the Dudweiler Colliery near Saarbrucken. It consists of a small fan 23½ inches in diameter, connected by a rubber tube with a vacuum gauge and an indicator and recording cylinder. The fan is driven by a belt from the shaft of the depth indicator. The fluctuations in the rate of winding are recorded by vertical lines drawn on the paper surrounding the cylinder, while the actual velocity at any given moment is shown by the pointer and scale. When men are being conveyed, the maximum velocity being 5m., the depression line is ½-inch long, and the fan makes 260 revolutions, correspondingly higher values being obtained during the winding of the buckets.

Mining Operations at Telluride, Colorado.

Special Staff Correspondence.

The new Smuggler-Union mill is nearing completion and will doubtless be in operation by the first of next year. The size is 100x285 feet on the ground, located on a slope of the hill, with elevator tower and storage rooms extending above the level of the tramway floor. The foundation stone work is of the heaviest character, the twelve battery motors, four tons weight each, resting upon seven-ton blocks of iron and the latter set in masses of concrete. The battery posts are 20x26 inches. The 400 H. P. condensing, tandem, compound engine which is being set in masonry of stone and concrete, is direct connected with the main battery shaft which runs the length of the mill. Each of the twelve batteries of five stamps is run by an independent subordinate shaft which connects by pulleys with the master shaft. By this arrangement any one of the twelve batteries may be detached from the main shaft without interfering with the operations of the others. The stamps are 1050-lbs. weight, of the Alaska Treadwell type, and will drop 110 to the minute. Below the batteries of sixty stamps will be the usual sets of amalgamating plates, the material from the latter passing over twenty-four bumping tables, each provided with sizing screens. The coarse product from the bumpers will pass to Wilfley tables set upon intermediate platforms, then reground in Chilian mills, the product from the latter passing to the thirty-two Triumph vanners, ranged symmetrically on the vanner floor below. The ore is first crushed at the mine and delivered by the tramway to the series of hoppers on the top floor of the mill, and passing from the hoppers over grizzlies, the coarse material being fed through six Dodge crushers, reducing it to ¾-inch size. Thus nothing coarser than ¾-inch is fed to the stamps, enabling them to work more rapidly. Four 125 H. P. boilers will furnish the steam power.

The old 50-stamp Smuggler-Union mill will continue to be operated. The crushed material from the stamps passes over plates, bumping tables and two sets of vanners, the coarse from the whole mill being ground by Huntington mills. The concentrates from the bumpers carry from 3 to 4 oz. gold, 6% lead, 60 oz. silver, 23% iron, 20% silica to the ton of concentrates. From one set of vanners the product carries .6 oz. to .7 oz. gold, 35 oz. silver; from another set it carries about 20 oz. silver and 1 oz. to 1¼ oz. gold. The old mill is now crushing about 175 tons of ore per day. The stamps are 850 lbs. weight and drop about 105 to the minute. It is expected that the combined capacity of the two mills will reach 450 tons of ore per day.

The workings of the Smuggler-Union mine are entered through the Bullion tunnel at a point about 1500 feet higher than the elevation of the mills, a wire rope tramway connecting the mine with the mills. The Bullion tunnel is at an altitude of 10,800 feet, is in a distance of 2300 feet along the strike of the vein. From the surface a shaft sinks vertically 1250 feet to the tunnel, landing near the breast, with stations at the second, third, fifth, seventh and ninth levels, the last named being the tunnel level. The distance between levels is 250 feet. The hoisting plant is on the third level, 280 feet vertically from the surface. The stopes above the seventh and fifth levels extend along the vein over a mile, following it from the southern end of the Smuggler grounds northward into the Sheridan and Mendota grounds, which belong to the Smuggler-Union Co. The drifts on the seventh and ninth levels are to be driven 2000 feet farther northward, which will take them to the limit of the company's grounds under the summit of the range. The shaft referred to starts on the vein at the surface, but where it strikes the tunnel level, 1250 feet below, the vein is 200 feet to the west, thus showing the dip of the latter westward. The ore above the fifth level is pretty well worked out, excepting at the northern end of the grounds. The present output comes from the stopes of the seventh and ninth levels. The vein maintains a tolerably straight course, a marked regularity in width, standing between trachyte walls, as was observed in following the stope above the seventh a distance of over a mile. The quartz, constituting the vein, is unusually hard and the method pursued is to strip the vein along the hanging wall, then breaking down the ore to the foot wall by hand drills and blasting material. Every 50 feet along the stopes is a "mill hole," or ore chute, cribbed by 2-foot timbers with ends facing the chute, which leads to the level. The ores are a quartz, carring free gold, iron pyrites bearing gold, silver, lead and zinc. At a point 700 feet below the Bullion tunnel is the Pennsylvania tunnel, taking the same general course, which is now in 1400 feet. This will be pushed farther and connected with the upper workings, giving a depth on the vein of about 1800 feet. All work in the stopes is done by contract at a certain price per fathom, measurements being taken in length and height on the vein, the width not being considered. Drifting is done by the foot. A. L. Collins is the general manager; C. W. Becker, mine superintendent; S. F. Elliott, superintendent of old mill. The construction of the new mill has been under the planning and superintendence of C. W. Van Law.

The Tom Boy upper levels, in Savage basin, are at an altitude of nearly 12,000 feet; the entire tonnage, however, comes through the lower tunnel which crosscuts the vein about 2000 feet from the entrance, this tunnel being the 600-foot level from the vein apex. At a point in the tunnel a vertical shaft is being sunk in the hanging wall, which has about reached the 800 level. A crosscut from the shaft through the vein has been made at the 700 level. The vein dips about 60 degrees. Development work to the extent of about one and a quarter miles has been done this year, making an aggregate of about three miles of work in the mine. The vein is opened through five main levels. The timbering of the mine is very thorough and extensive, the stull system being used. The mill is just below the tunnel entrance. It is equipped with crushers, rolls, grinders, amalgamating plates and vanners, the material passing over the plates through 30-mesh screens. The plates are cut into sections by traverse riffles, by which the black sand, mixed with gold particles and quicksilver, are caught. At intervals the material from these riffles is taken out, ground in a clean-up pan, with additional quicksilver, and separated from the black sand. By this method, also, the iron is intercepted, largely, and kept from going to the vanners. The vanner product is a very clean concentrate, containing not more than 6% of silica. The lead product comes from special streaks in the vein. The mill is treating about 180 tons of ore per day. Since last year power for the compressor plant has been changed from steam to electricity. A pumping plant on the opposite side of the range, operated by electric motor, delivers water from a lake to the mill through a pipe line. J. Herron is manager of the property.

The Hector Mining Co., operates the Cimaron mine and mill and persons similarly interested are driving the Ophir tunnel under Montana basin, which lies between Savage and Marshal. This tunnel is in over a mile and is driving toward the Virginius grounds on the Ouray side, and is an enterprise at the head of which is A. E. Reynolds. A tramway is being put up from the Ophir tunnel entrance to the Cimmaron mill and an addition to the latter is being built.

A. E. Hampson is operating a canvas tailing plant, near Pandora, through which he runs the tailings from the Smuggler mill. He ships about eight cars a month of slime concentrates, which are at least 100 mesh, the values obtained therefrom, Mr. Hampson states, being about $50 per ton in gold, silver and lead.

The Liberty Bell G. M. Co. is milling about 100 tons per day at their 40-stamp mill, and an addition is being erected for putting in forty more stamps. It is stated that about 75% of the saving is made on the plates and the balance in concentrates. The material from the plates passes through hydraulic sizers, separating the fine from the coarse, the former passing to one set and the latter to another set of concentrators, there being eleven double-decked tables in the mill. The ores from the Liberty Bell are a white, blue and brown quartz, bearing free gold and gold values in iron pyrites. The ore is crushed at the mine, then delivered at the mill by tramway.

WASCOTT.

Telluride, Colo., Nov. 3d, '99.

Hauling Lumber with Traction Engines.

(*Continued from Page 569.*)

and the cost of transportation by oxen or mule teams is so very expensive that the millman or miner had but little left from his season's work after deducting cost of hauling to and from the railway. This problem has been successfully solved by the application of steam power to traction engines designed for the work to be done, affording a method of transportation that has large capacity, is economical to run, and can be operated as a rule wherever animal power has been used, each outfit requiring but one engineer and one fireman to run it, doing the work of many animal teams and reducing the cost of transportation of freight 50% less than it was by animal power.

These machines are operated successfully where it is practicable to use mule or ox teams, ascending and descending steep grades over the mountain roads, or on the plains, hauling their immense loads of forty and fifty tons over grades from 8% to 15%, traveling at a speed of three miles per hour.

The engine illustrated on the first page of this issue is rated actual 50 H. P.; has double cylinders which are firmly attached to a steel bed frame independent of the boiler. The drive or carrying wheels are 8 feet in diameter, tires 24x¾ inches; lead wheel 5 feet in diameter; tire 15x¾ inches, and is furnished with steel gearing throughout. The whole machine except the cab is substantially built of steel and the best of iron, to stand the heavy work for which it is designed.

The wagons are also constructed of good material and have a carrying capacity each of 4000 to 5000 feet of lumber. This particular train has a load of 24,000 feet lumber, board measure.

Copper Tubes and Sheets Direct from Solutions.

Copper is now largely deposited from solutions. There are forty refineries which dissolve and deposit all their copper, and it is estimated that over one-third of the total copper output of the world is refined in this way. This signifies the transport of the copper, atom by atom, across the vats by the electric current; one cubic inch of copper contains roughly sixty thousand billion atoms. This is a great expansion of what was merely a laboratory method of purifying. The great success of this method of refining is due largely to the value of the so-called impurities of raw copper. Nearly all copper ores contain silver and gold; and where raw copper obtained from these ores is refined, the silver and gold are found as an insoluble anode sludge upon the bottom of the vats. From this sludge these metals can be obtained as bullion by a simple and inexpensive chemical treatment. The value of the bullion recovered in one year by this means at the Anaconda, Montana, refinery was $3,500,000; and if one assumes the average raw copper is only one-half as rich in precious metals as the Butte ores of Montana, the value of these impurities, separated every year, would amount to $8,000,000.

The method of refining adopted by different companies is practically the same, though they differ in the arrangement of the vats and in the distribution of the electric current. The raw copper is cast into plates of convenient size and suspended in a solution of copper sulphate, with thin sheets of pure copper on each side of it. When the current is passed through the solution the raw copper dissolves, but is deposited again on the thin sheets of pure copper, while the impurities sink and form the anode sludge or remain in the solution. The deposited copper is usually of coarsely crystalline structure and is smelted to obtain the ingots in commercial form. Further operations are necessary before this pure electrolytic copper can be obtained in the form of plates, tubes or wire, and it was therefore natural that attempts should have been made to obtain deposits of copper which should be dense and even in composition and also possess the form of the article or product wanted.

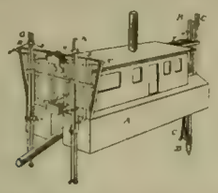
The difficulties to be met and overcome in obtaining such deposits were, however, greater than imagined, and it is only within the last two years that sheets and tubes of electrolytic copper on a commercial scale have been produced directly from the solution. There are now two processes, both patented, which produce these results.

The older of these processes—the Elmore—aims to produce seamless tubes of pure copper by the deposition of the metal upon a revolving mandrel of suitable diameter, this mandrel acting as the thin sheet of pure copper in the vat above described. The earlier patents describe a method of obtaining a smooth deposit by the application of pressure from traveling agate burnishers; but this method was found to produce a foliation of the deposit, and much time and money has been spent in overcoming this defect. A satisfactory tube has been made by using a modification of the original process.

The second is that known as the Dumoulin process, from M. Dumoulin's laboratory in Paris. The process obtains smooth and dense copper by the application of a thin insulating coating to the inequalities that form on the surface of the metallic deposit. As before, the copper is deposited upon a revolving mandrel, but only one-half of this is immersed in the solution. The insulating material is applied by impregnators which have a movement along the length of the surface of the deposit, and coat all projecting parts with a thin film of animal matter. The film hinders further deposition until the surrounding depressions have been raised to the common level. The insulating film is being removed continuously by the oxidizing action of the air and of the solution, and thus deposition of copper can occur again on any part, as soon as it has ceased to be coated by the animal matter out of the impregnator.

Revolving mandrels, 12 feet long by 16 inches in diameter, are used in the electrolytic vats. When the deposit of copper has attained a thickness of one-sixteenth of an inch the copper tubes are removed and are cut lengthwise. In this manner copper sheets are obtained of satisfactory quality.

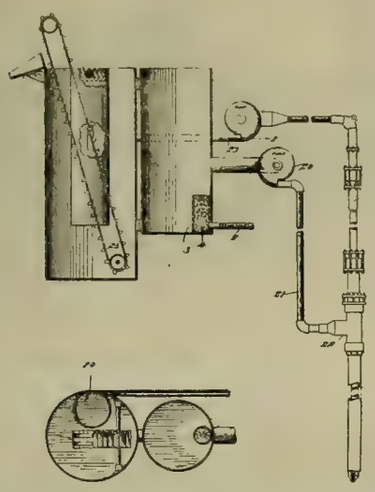
The sheets are applicable to all ordinary purposes and are sold at the same price as ordinary sheet copper. The Electrical Copper Co. of London states its intention to show that this process may be used for the manufacture of boiler tubes and other hollow articles.



That these two processes can turn out satisfactory products is regarded beyond doubt, and their future success is to depend solely upon the economic factor in their operation. It may be pointed out here that in both cases the value of the impurities found in the slimes may materially affect the results, and, as in the older electrolytic copper refining industry, success will largely depend upon obtaining raw copper which is known to be rich in its contents of silver and gold.

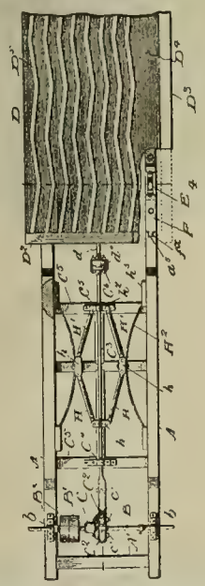
Latest Mining and Metallurgical Patents.

Patents Issued Nov. 7, 1899.



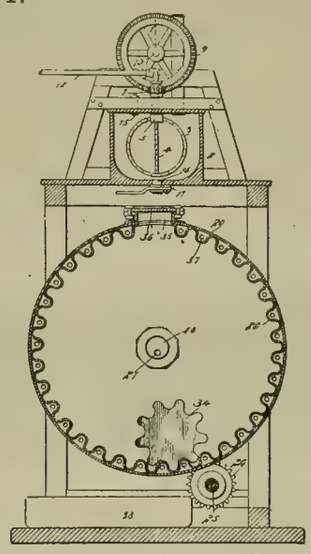
Specially Reported for the MINING AND SCIENTIFIC PRESS.

HYDRAULIC DREDGER.—No. 635,798; B. H. Muehle, Detroit, Mich.



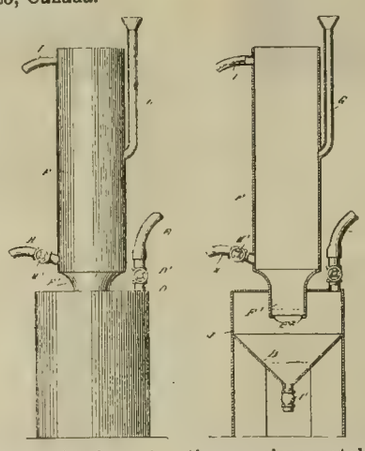
A dredger hull provided with a pivotal spud at one end, and one or more spuds or poles sliding up or down within hinged and oscillating sleeves at opposite end of hull, which also carries an excavating device, these parts being so arranged that the hull and excavating device may be moved laterally about the pivotal spud.

APPARATUS FOR RAISING BITUMINOUS SAND FROM WELLS AND SEPARATING BITUMEN FROM ITS IMPURITIES.—No. 636,117; A. S. Cooper, San Francisco, Cal.



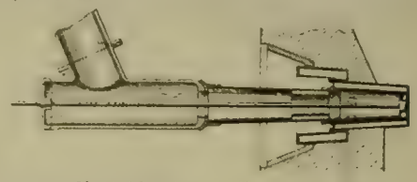
In an apparatus for raising bituminized sand from wells and separating the bitumen from the impurities, a hot water tank, a separating cylinder open at its bottom, a pump having pipe connection with cylinder, a pipe leading from pump to a tube designed to extend into the well, a jacket surrounding tube, another pump having connection with the water tank and also having communication with the space between the jacket and the tube, and an injector at the lower end of the jacket and tube, and means for discharging a heating medium into the tank, a sand receiving tank, an elevator in sand receiving tank, a hydraulic pipe having connection with the pump, a jacket surrounding the lower portion of pipe, a pump having connections for forcing water from the water tank into the jacket and an injector at the lower end of the jacket and pipe.

ORE CONCENTRATING MACHINE.—No. 636,679; J. H. Michelsen, Butte, Mont.



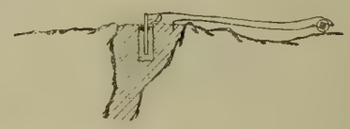
In an ore concentrator, the combination with a vibrating table, roller bearings for supporting the same; means for raising rollers under one side of table; of a pitman provided with a vertically adjustable connection to table and also provided with a pair of toggle levers upon each side, levers being pressed inward by curved springs, one end of toggle levers being connected to the pitman and the other upon the frame of the machine; and an eccentric connected to pitman provided with means for varying the movement of pitman. An ore concentrator, consisting of a vibratory table adapted to be tilted toward one side, a pitman adjustably connected thereto and provided with bearings, toggle levers interposed between pitman and a portion of the frame of the machine provided with springs tending to retain the toggle levers extended, springs being provided with bearing blocks upon frame; of a driving shaft having rigidly mounted thereon a flanged collar, and a circular slotted disk adjustably secured to collar, the disk being surrounded by an eccentric strap, strap being connected to one end of pitman. The combination with a vibratory table adapted to be tilted to one side, and a pitman provided with means for adjusting the throw of table and means for taking up lost motion; of a connection between table and pitman composed of a flanged slotted collar rigidly secured to the end of pitman provided with a dovetailed groove of uniform width, extending transversely across collar, and a similar slotted collar rigidly mounted upon a portion of table, but provided with a dovetailed tongue of uniform width extending transversely of collar adapted to slide in the grooved portion upon the other collar, and slots upon both coinciding, both passing through the slots to secure the collars together.

AMALGAMATOR.—No. 636,666; J. M. Holmes, Glens Falls, N. Y.



An amalgamator, comprising a pulverizing drum, consisting of an inner and an outer sheet-metal shell, the inner shell being corrugated, double heads closing each end of the cylinder, the spaces in the heads being in communication through the peripheral passages formed by the corrugations of the inner shell, the space in one of the heads being adapted to receive a heating medium entering through a port in one of the trunnions of the drum, the space in the other head being adapted to discharge the heating medium through a port in the other trunnion of the drum, and a longitudinally corrugated mulling cylinder arranged within the inner shell and adapted to be rotated by the corrugations of inner shell.

APPARATUS FOR EXTRACTING PRECIOUS METALS FROM ROCK, SAND, ETC.—No. 636,675; J. F. Latimer, Toronto, Canada.



An apparatus for extracting precious metals from rock, sand, and the like, comprising an upright receptacle having an open contracted bottom or throat, an overflow outlet near the top, a valved pulp outlet near the bottom, a material inlet between the two outlets, a ring set in the contracted bottom or throat to reduce the size thereof, and a receiver through the top of which extends the contracted lower end of the receptacle, receiver having a valved liquid inlet at its top and a valved concentrates outlet at the bottom.

APPARATUS FOR REGULATING DISCHARGE AREA OF FURNACE TWYERS.—No. 636,239; P. Benni, Ostrowiec, Russia.

In an adjustable twyer the combination of a tapered nozzle or inlet, a hollow annulus of size to fit and partially close the nozzle or inlet, and combined adjusting and cooling pipes movable longitudinally of nozzle or inlet, and secured to the annulus, and guides through which pipes pass.

ELECTRO METALLURGICAL PROCESS OF EXTRACTING NATIVE COPPER.—No. 636,321; T. Craney, Bay City, Mich.

A process for mining native copper where it occurs in isolated masses or boulders, which consists in forming a cavity in mass or boulder, suspending a copper rod within cavity and in electrolytically depositing the copper from the mass or boulder upon the copper rod, by constituting the copper rod, the cathode and the mass or boulder, the anode of an electrolytic cell and the containing vessel for the electrolyte. The herein described process of mining masses or boulders of native copper, which consists in applying the electro-metallurgical process of extracting the copper directly to the mass of copper in situ.

PROCESS OF EXTRACTING PRECIOUS METALS FROM ORES.—No. 636,288; H. de Raasloff, New York, N. Y.

The improvement in the process of separating precious metals from their ores, consisting in mixing with the ore a solution of a base and a solvent for precious metals, which solvent is capable of being separated from the base by oxygen and adding liquid air to the ore and solution, the solvent being capable of being separated from base by oxygen, evaporating nitrogen from liquid air, and adding the oxygen which remains to the mixed ore and solution.

New Method of Detecting Gold.

A new method of detecting the presence of a small quantity of gold has been recently discovered by Dr. Ohler. By this method the presence of quantities as low as 77 centigrammes per ton may be established. The operation is as follows: A quantity of finely powdered ore, say 120 grammes, is introduced into a flask. To this an equal volume of tincture of iodine is added, and the mixture well agitated. It is then left for an hour, agitating from time to time, and is finally allowed to stand. When the solution has separated, a band of filter paper is saturated with this, and the paper allowed to dry. This operation is repeated five or six times in succession, in order to completely saturate the paper. It is afterward calcined, and it will be observed that the ash, when gold is present, offers a purple color. This color should disappear quickly if the ash is moistened with bromine water. The test may be modified in the following manner: A quantity of the powder, 120 grammes, is covered with bromine water, and after agitating during the course of an hour, the solution is filtered. Upon adding protochloride of tin to the solution, it takes a purple color, in the presence of gold, giving the reaction known as "Purple of Cassius." In the case of sulphides the ore should be previously roasted, and when the mineral contains a considerable proportion of carbonate of lime, it should be calcined in the presence of ammonium carbonate.—Scientific American.

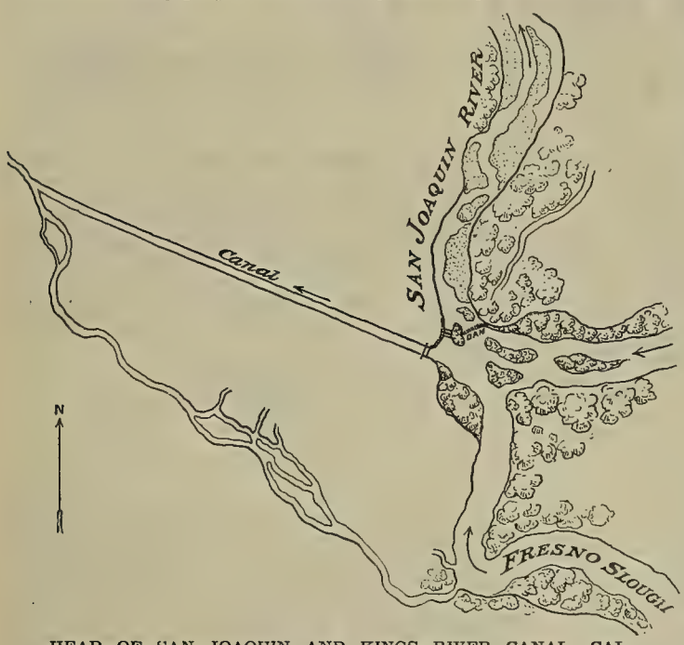
Cordially Appreciated.

The MINING AND SCIENTIFIC PRESS of San Francisco is the best mining paper printed.—Telluride, Colo., Journal, Nov. 4.

The MINING AND SCIENTIFIC PRESS of San Francisco is the oldest and best publication devoted to the mining industry on the coast.—Globe, Ariz., Silver Belt, Nov. 9.

Headwater Workings of a California Irrigation System.

This paper has had considerable to say about the conservation of water, the necessity for storage in California and other States, that the mining, electrical and other industries might be served and protected.



The present meeting in San Francisco of the Society for the Preservation of Water, which has that desideratum in view, makes timely some reference to a typical California irrigating system.

There are many people who talk very earnestly and well about the benefits of conservation of water who have little idea of the way in which the water that is producing wealth is taken out from the streams which bring it down from the melting snows and heavy rains of the mountains. Possibly some of our California readers who are using this water to excellent advantage have a very indefinite idea of where it immediately comes from and by what headworks it is turned aside from its natural course to the sea to render them service. All these details of methods seem to be commanding increased attention in these later days, because the great arid interior is awakening to the opportunities opened by irrigation and is desirous to know how California gets her irrigation water. For this reason the Government experts are giving increased attention to California and the systems of the San Joaquin valley are carefully described and illustrated in late Government publications.

An instance of this is found in the Water Supply Papers of the U. S. Geological Survey, in which the local descriptions are by C. E. Grunsky, a California irrigation engineer. From this source is taken an exposition of the works of the San Joaquin and Kings River canal, one of the oldest in the valley, distributing water over a considerable area.

The first engraving shows the canal starting in a westerly direction from the San Joaquin river, below the discharge of the waters of Fresno slough. Below the opening of the canal an island is seen in the San Joaquin which was taken by the engineers as a vantage point in their work. The engraving also shows the steamboat chute filling the space from the bank to the west side of the island. The second engraving shows a sketch of the same island with the end of this chute on the right, and on the left, reaching away to the farther bank, the brush dam which backs up the water so it will flow freely into the canal. The two lower engravings give up and down stream views of the steamboat chute already mentioned.

The canal is fifty feet wide — about the same as the width of the steamboat chute which is near it. This chute is obviously a way to raise the water as high as necessary without putting in an obstruction, which would stop navigation. It has a a falling dam, which holds back the water except when its lowering is required by the occasional passage of river craft. The views show that the works required much piling and planking, and are therefore a constant item of expense, as is also the 350 feet of brush dam which has to be repaired or replaced each spring after the winter floods have done their worst with it. Besides the piling and sheathing, much brush and sacked sand have to be used to protect the natural banks from cutting. Still the enterprise has proved profitable to Miller & Lux, who are practically the sole owners of the system, and they have had in some years as much as 38,000 acres under irrigation from this source. They have developed colony enterprises upon it, and the recent considerable development of that area has shown what irrigation can do for that arid region by the prosperity which prevailed there during the recent years of drouth.

DOWNSTREAM VIEW OF STEAMBOAT CHUTE, CAL.

A New Alloy.

Magnalium, says the *Electrical Review*, London, is the name of a new alloy of aluminum and magnesium, discovered by Dr. L. Mach, which is said to possess valuable properties. The addition of magnesium in quantity not exceeding thirty, and not less than ten, parts by weight to one hundred parts by weight of aluminum, imparts to the latter metal properties which, in the pure condition, it does not possess, without raising its specific gravity (2.64), on the contrary, slightly lowering it, since the specific gravity of magnesium (1.74) is even less than that of aluminum. The addition of magnesium produces an alloy which is harder, and is easier and cleaner to work than pure aluminum. Turning produces a surface as bright as a mirror, and shining like silver, the metal coming off in long spiral turnings. The alloy files clean and regular; without tearing, or choking the file, as aluminum does. Deep and sharp screw threads can be cut on it, and very clean holes can be bored out. The color of the metal resembles silver more than aluminum, and it takes a high polish. The hardness and strength of the alloy are considerable; the hardness can be varied by varying the proportions of aluminum. An addition of heavy metals is not only unnecessary, but is positively injurious, since this deteriorates its working properties and increases its specific gravity. Previous attempts to make useful alloys of aluminum and magnesium are said to have failed, owing to the aluminum not being pure. This point is of great importance, and aluminum made by an electrolytic process must be used.

THE Ontario Government has granted a concession of 1200 acres of corundum lands in Hastings and Renfrew counties to a syndicate headed by J. N. Shenstone, of the Massey-Harris Mfg. Co. The concession is in the form of a lease for a term of ten years, renewable. The syndicate is bound to expend at least $100,000 during three years in developing the lands and erecting a plant for the crushing of corundum and manufacture of abrasive goods and other articles. Twenty-five thousand dollars are to be laid out on a plant. An unusual feature is the retention by the Government of the right to fix the maximum price at which corundum may be sold in the Dominion.—Canadian Mining Review.

THAT was a remarkable demonstration of what a mogul can do, that occurred on the New York Central the other day, when engine No. 948, one of the new moguls, hauled out train No. 11, the Southwestern Limited, made up of two mail cars, five passenger coaches and nine Wagner cars, sixteen cars in all. The total weight of the train was 1,832,000 pounds, or 916 tons, and the length of the train, including the engine, was 1212 feet, or nearly a quarter of a mile. This engine made the running time of the train between New York and Albany, 143 miles, in three hours and fifteen minutes.

SOME large and rich mines afford excellent illustrations of how things should not be done. Indeed, if they were not rich probably they would soon close down as monuments of unfortunate investments. A rich mine will pay with any kind of management.

Alamo Mining Camp, Lower California.

Written for the MINING AND SCIENTIFIC PRESS by J. D. LOWRY.

Lying in the southwestern corner of a mountain-fringed plateau or table land, seventy-five miles to the southeast from Ensenada, Lower California, is the town of Alamo, with its adjacent mines and mills, 4500 feet above sea level.

Here, in the year '89 a discovery of gold was made, and a rush to the region followed from all parts of the United States and Mexico, and even from Europe, but the larger part were from California. To those first on the ground the region offered a rich field both for placer and quartz mining.

In the case of the placers, of which there were and are still considerable deposits in Alamo, they were of such richness in the early days of the camp that gold could often be picked up on the surface in good sized nuggets in the vicinity of what is now the town, but like the San Roque placer diggings, over which there was some excitement during the past spring and summer, it soon played out. Then, owing to a scarcity of water, placering was abandoned by white men, but Chinamen kept the field, and are still there in considerable numbers working these deposits, notwithstanding that every bit of water used is carried a considerable distance to the diggings in buckets, etc., and it is safe to assume that they are making more than a living out of them.

The ledges, too, were of extraordinary richness at the surface, the ore running anywhere from $10 to $5000 in gold to the ton. Shafts were sunk, mills erected, and Alamo in a short time became a busy and booming mining camp. At the present time the ore rarely reaches the $100 mark per ton, and averages but a small fraction of that amount.

The boom had a comparatively short existence, as at the end of a year and a half from the time it started it suddenly subsided, and great numbers left the camp, some of them tearing down the buildings they had erected, and, as a consequence, Alamo is now suffering from the want of decent accommodations in the way of houses and rooms for those living there.

The formation of the region is very irregular. No regular or permanent ledge has been found up to the present time, although a depth of 350 feet has been reached in the Montezuma mine. Violent dynamic forces have been at work, and as a result the whole formation appears as a mass of faulted ledges cut by intrusive porphyritic and other dykes. Gash veins are also of frequent occurrence, rendering mining an uncertain proposition in Alamo.

The quartz is found principally in walls of granite and slates, although schists, sandstone, hornblende rock, etc., are also found. A reddish cast predominates, owing to the great prevalence of iron oxide. The ore is principally free milling, but considerable sulphurets, chiefly iron pyrites, are found associated with the gold. Galena is also of frequent occurrence.

At the present time there are six mills and one cyanide plant in working condition in Alamo, but it is rarely that they are all in operation at the same time.

Of the above-mentioned plants, four are 5-stamp mills, viz.: the Aurora, 1000-lb. stamps, owned and operated by the Aurora M. & M. Co.; the Montezuma, 1000-lb. stamps, owned and operated by Los Angeles parties; the St. David, 1100 lb. stamps, leased and operated by the International M. & M. Co., and a private prospecting plant owned and operated by parties living in Alamo.

Of the other two mills, one is a rotary mill, owned and operated by a Frenchman living in Alamo, and the other is a Bryan, owned and operated by the Texas M. & M. Co., of Kansas City, Mo., in which Senator Cockerell of that State is interested.

With the exception of the last named mine, the Texas, which uses a Dodge rock breaker, each of the above mills is supplied with a Gates ore crusher.

The cyanide plant, owned by Wiggins, Albright & Neal, of California, is erected on the ruins of the Princessa mill, which burned some years ago, and they are now working the tailings of this mine. They also expect to work the tailings of the other mines in the camp, and have already secured the option on the tailings of the St. David mine. In the early days of Alamo the Princessa was one of the richest mines in the camp, and little attention was paid to saving anything but the coarser gold; consequently, considerable fine gold passed over the tables into the tailings.

The cyanide people erected their plant in July last, but while not yet complete, they have been working the last month, and from all accounts with good results. The plant consists of three tailings or pulp vats of forty-one tons capacity each, two solution tanks, two precipitating boxes, two regenerating or solution strengthening tanks, and one alkaline wash tank. The tailings vats and solution tanks are connected by pipes in such a way that two or all three of the former can be worked at the same time.

Zinc shavings are used as the precipitating medium. The solution has a strength of about 0.5% cyanide. Up to the present time caustic soda has been used as a neutralizer, but after recent experiments with lime they have concluded that it will serve the purpose equally well, and thus enable them to do away with the costly importation of the former. At the time of the visit of the writer to the plant no means other than the shovel for either filling or emptying the pulp vats were employed, but appliances for both of these purposes will be installed. All pumping of solutions was done by hand, a very slow and laborious process, but it was stated that a steam pump was to be put in.

MINING SCENES IN ALAMO, LOWER CALIFORNIA.

From a climatic and scenic standpoint the location of Alamo is ideal. The plateau on which it stands is sixteen miles long and two to three miles wide, walled in on every side by mountains. The plateau offers good facilities for farming and grazing, and there are a number of farms and ranches scattered over its eastern end.

The population, numbering from 400 to 500, is mostly composed of Mexicans, although there are a number of Americans and Europeans, and a number of Chinamen. Board costs $8 (Mexican) per week, and sleeping accomodations from $1 to $3 (Mex.) per week. Clothing and other necessaries of life are high, as nearly everything sold in the place comes from the United States, and pays not only a high duty but a heavy freight charge as well.

Fuel (wood) is cheap, it being $7 (Mex.) per cord. Labor is also cheap, wages ranging from $2 (Mex.) per day for muckers and ordinary laborers to $3.50 (Mex.) per day for miners.

San Francisco, Cal., Nov. 2nd, '99.

Cheap Mining and Milling.

In the issue of the 4th inst. appeared a paragraph to the effect that the Spanish mine near Washington, Nevada county, Cal., had been closed down and would not be started up again. The company had been working the mine by means of an open cut for many years and made a profit on ore that went 95 cents per ton. The cut had got so deep that the property could not be worked in that way any longer, and it would not pay to work through a shaft.

In response to a request for some accurate data the following is reproduced, having been originally prepared from the superintendent's report. The figures show what was probably the cheapest milling of ore ever accomplished in the world, and while the circumstances were exceptional, the results show what may be accomplished under similar conditions.

At the mine at the time this data was prepared the vein averaged 90 feet; the hanging wall was slate, soft, shaly and not well defined. The true vein was on the foot wall and consisted of solid quartz, 4 feet thick, and did not pay for working. The pay was found on the hanging wall side, which contained many veinlets and streaks of ferruginous quartz carrying gold. Where no quartz was to be found, there was no pay. The slate on this (the west) side was talcose.

The main tunnel was in 1200 feet. The vertical distance from the surface to the end of the main tunnel was 350 feet. One of the methods of extracting ore there was as follows: There was an excavation from the tunnel to the surface which acquired the form of an open cut with sloping sides, too steep for a man to stand on; a man with a churn drill was lowered by a rope; he drilled a hole which, when deep enough, was charged with about five pounds of powder and fired, causing a large quantity of the soft slate to slide to the bottom, whence it was taken out through the tunnel. The mine employed a foreman, two white men and eight Chinese, who extracted about 4000 tons of ore a month—enough to keep the mill at work. The wages paid were: white men, $3 per day; foreman, $3.50; Chinese, $1.50.

The ore obtained came out of the tunnel by gravity, the empty cars being hauled back by mules. The ore was passed through a Blake rock breaker and then ground in a Huntington roller mill, of which there were three of 5 feet diameter and one of 4 feet. The mills, which made fifty-eight revolutions per minute, were fed by Hendy automatic ore feeders.

The following record of one month's run of the mine may be taken to indicate the low cost of working the ore, and to show, also, how a very low grade of ore may be profitably treated when the conditions are all favorable:

MINE—COST OF PRODUCTION.

(Run: 28 days' work produced 3443 tons of ore).

	Labor.	*Supplies.*	*Total.*
Extracting ore	$703 50	$113 41	$816 9
Delivering ore to mill	160 20	17 95	178 15
Dead work	105 20	10 93	116 13
General expense	78 35	1 95	80 30
Total	$1,047 25	$144 24	$1,191 49
Cost per ton	.304c	.042c	.346c

MILL—COST OF REDUCTION.

(Run: 24¼ days reduced 3443 tons of ore).

	Labor.	*Supplies.*	*Total.*
Mill expenses	$227 32	$194 33	$421 65
Water for power	.....	161 70	161 70
Handling ore	154 50	5 35	159 85
General expense	78 40	1 95	80 35
Total	$460 22	$363 33	$823 55
Cost per ton	.133c	.106c	.239c

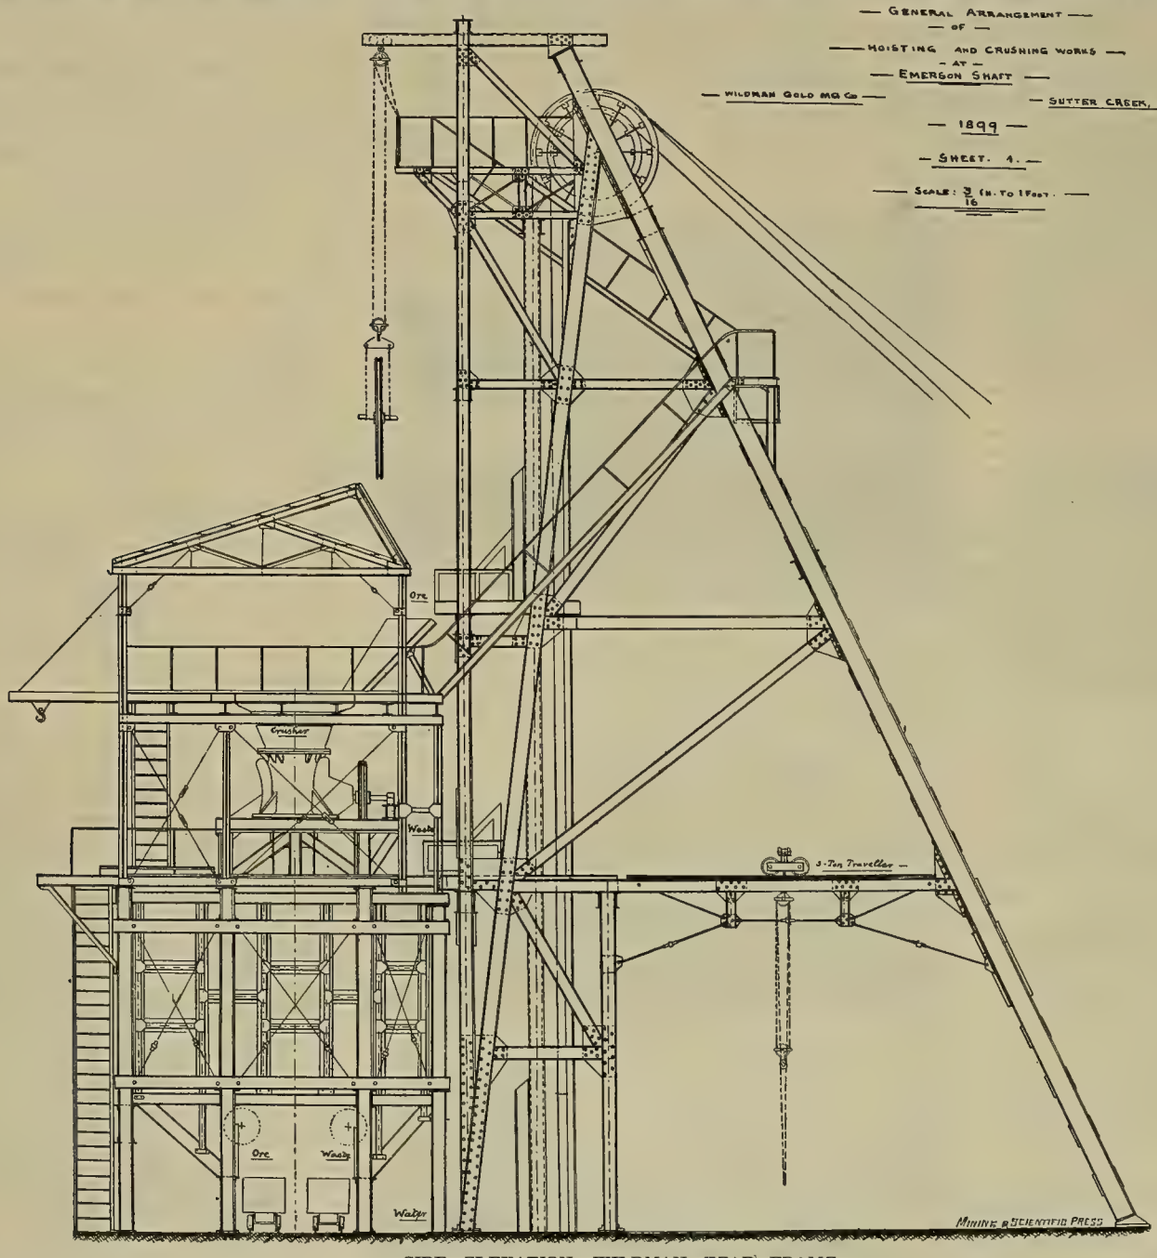
Bullion produced	$3,138 55
Total expenses	2,015 04
Profit	$1,123 51

It will be seen from this that the ore only yielded a trifle over 91 cents per tor, yet a profit of 32.6 cents per ton resulted. The percentage of profit was 35.8 of the total. In the previous month 2796 tons of ore were worked, which yielded $1.16 per ton. The profit was 56 cents per ton, or about 48% of the total. The profit that month on a yield of $3268.49 was $1572 91. The cost of mining was 37½ cents and of milling 23 cents per ton.

THE increasing application of concentration to low-grade ores is resulting in a largely increased output of both precious and base metals.

The Emerson Shaft of the Wildman Mine, Sutter Creek, Cal.

Written for the MINING AND SCIENTIFIC PRESS by JOHN ROSS JR.



The Wildman and Mahoney mines are among the oldest in the California gold belt. The properties, originally worked separately, have been consolidated under a single management, and have been extensively developed and exploited during the past four years. The diamond drill has been effectively employed in prospecting beyond the limits of the mine workings, the result of which was so satisfactory that it was determined to sink a new vertical shaft in the hanging wall country, which would render the extensive operation of the mine at great depth easy of accomplishment, it being impossible to carry on deep mining economically through the original shafts, sunk on the veins.

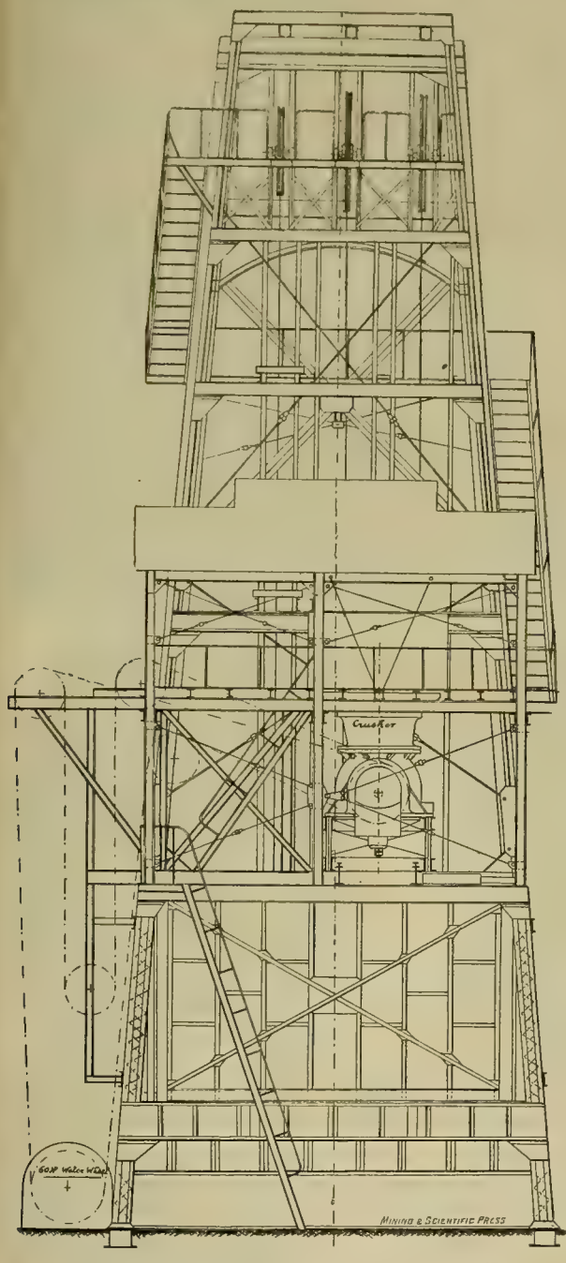
The new or Emerson shaft, as it is called (named after the president of the company), is vertical, and is being sunk nearly 1000 feet east of the present Wildman inclined shaft. It is calculated that it will cut the Wildman vein at a depth of between 2300 and 2400 feet. It is difficult to give the exact depth, as through this section the lode flattens more or less in depth. It is now down over 700 feet, and making at the rate of 2 feet per day. The ground passed through is mostly diabase, with some very hard grey slate (altered diabase), an occasional seam of black slate and stringers of barren quartz.

A seam of asbestos 4 inches thick has also been passed through.

The excavation outside of timbers is 8x20 feet and is made across the stratification of the country—that is, the length of the shaft is east and west. Timbers used are all selected spruce, 12x14 inches, framed in the usual Comstock style, with the following exceptions:

First—The wall plates are placed with the 12-inch side vertical, and the dividers with the 14-inch side vertical. A dap is cut ½ inch deep out of the wall

SIDE ELEVATION, WILDMAN HEAD FRAME.



GENERAL VIEW OF WILDMAN MINE, SUTTER CREEK, AMADOR COUNTY, CAL.

plate, top and bottom, for the center posts, which leaves 1½-inch footing and heading for the posts, as the 14-inch side, or end of the divider, comes against wall plate and posts, thus giving more strength to the wall plate and a better footing for the posts than would be the case if the divider was of the same width as the wall plate.

Second—As seen in sketch of divider, a 2-inch piece of filling is inserted behind each guide, which gives 4 inches to work on (in keeping guides true) in case of a squeeze in the shaft.

The sketch of section of shaft shows a small "service cage" in the pump compartment for the use of foreman and pumpman. It is to be run open on two sides, to facilitate the handling of long lengths of pipe. All of the pipes are set on the side of the shaft opposite this cage.

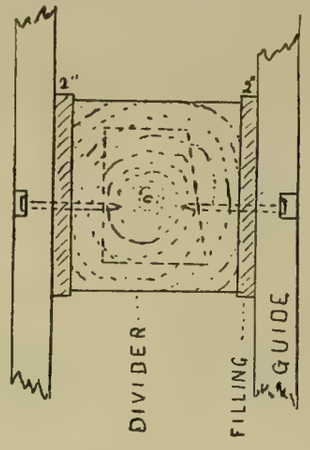
The ladders are each 15 feet long, inclined over each other, there being a landing at the end of each ladder.

FRONT ELEVATION, WILDMAN HEAD FRAME.

The shaft sets are 4 feet apart, or 5 feet from center to center of wall plates. The skip compartments are 4½x4½ feet and the pump and ladder compartment 4½x5 feet.

The wall plates and ends of dividers are framed so that the dividers are driven up, into place, instead of down, which will prevent their being knocked out by blasts.

It is the intention to use skips that will carry three tons of ore at a load, making total weight of load (including cable and skip), starting at a depth of about 2500 feet, of about six tons.

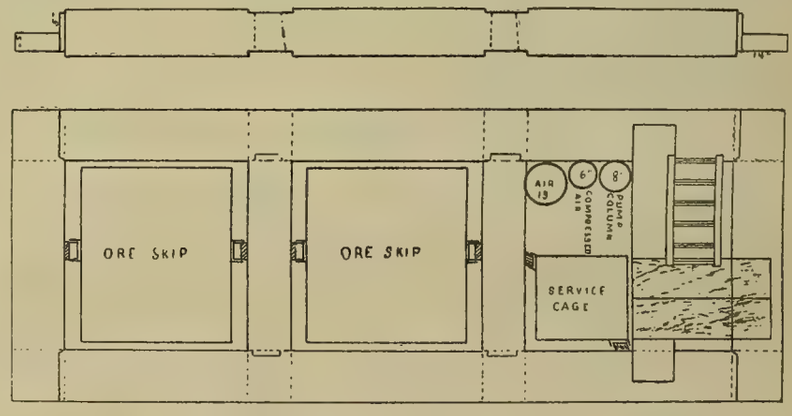


Foundation of stone and cement for permanent gallows frame or head gear has been built from bedrock to the level of the collar of the shaft. The temporary head gear now in use is so built that the permanent structure can be erected over it without interfering with the work.

The head frame for this shaft was designed by A. E. Chodzko of San Francisco, Cal., and is to be built entirely of steel. In this arrangement the switches for the different dumps—for water, waste and ore—will be operated either by compressed air or electricity, and will be under the control of the engineer.

The rock breaker will be set in a steel frame, which is in front of but entirely independent of the main head frame. The crusher will be run by rope transmission from a 60 H. P. wheel.

Travelers have been provided for the rapid and safe handling of skips when changing from water to ore skips, or vice versa. The skips are automatic and require no attendance, the arrangement being such that ore, water or waste may be dumped where desired, the engineer having complete control. Over each sheave is a runway with travelers arranged for handling the sheaves by means of chain blocks, which dispenses with the temporary rigging up of gin poles, such as are commonly employed for the purpose.



This structure throughout has been designed with care and is calculated to meet all the modern requirements of deep mining. This is the first large steel head frame to be built in California. The engravings give a front and side elevation of the structure,

GUIDES FITTED WITH BLOCKS.

in which the details are clearly shown. The resultant strains fall just in front of the main compression members, and the design throughout is one calculated to afford great strength and rigidity with a minimum of material.

THAT there have been failures in mining as well as in other branches of business cannot be denied, and the causes generally are not hard to find. As is the case in most other pursuits, failures can generally be traced to lack of capital and experience. Some say mining is a gamble, and it is in the sense that most other callings are a gamble. The farmer ventures with his crop of wheat, not knowing whether he is going to have eight bushels of wheat to the acre or thirty at $1 until the harvest is over. The real estate man buys town and farm property, pays taxes on it for years and often sells below cost, and a careful estimate of the mercantile line shows that not more than 10% of those who enter it succeed. If there are more failures in mining than in farming, it can be explained on the ground that the larger the profit when a success is made, the larger is the number who make the venture regardless of means and experience. Mining, like other industrial pursuits, requires capital and experience. When a company engages in it, it is not necessary that all the members thereof should possess both, if only both are united in the management, although it is more satisfactory all around if it is the case.

ARRANGEMENT OF TIMBERS, WILDMAN SHAFT.

The Vanderbilt Mining District, San Bernardino County, Cal.

Written for the MINING AND SCIENTIFIC PRESS.

In the extreme eastern portion of San Bernardino county, Cal., about seven miles from the Nevada State line, is the Vanderbilt mining district, which at one time attracted widespread attention, but from which comparatively little is heard lately. Still, there are valuable mines in Vanderbilt, and they are being worked, but in a quiet way, and, consequently, are little heard of.

The district is in the low hills which lie at the northeastern end of the New York mountains, the latter being properly a continuation of the Providence range. These hills are rounded by erosion, with here and there a rugged outcrop of a ledge of some harder rock formation. Surrounding the low hills on the east, southeast and south are high abrupt bluffs of volcanic rock—the remnant of a great flow which at one time must have covered hundreds of square miles of this region. These rocks consist of rhyolite tuff, rhyolite and andesite, lying in thick layers, apparently comformable, and forming a series of terraces 1000 feet in height. Thus far no mineral deposits have been found in these rocks, though identical with the rhyolites, liparites and tuffas at Calico, 150 miles to the westward.

Underlying these volcanic rocks is a crystalline formation, the geological age of which is not known, but which probably belongs to the Palæozoic. The geological structure is simple, consisting of an alternating series of gneissoid and schistose, granitic and hornblende rocks, intruded by large, irregular masses of coarsely crystalline rock (pegmatite), containing an abundance of rose-colored orthoclase and little mica. The absence of mica in all of these rocks is a noteworthy circumstance.

Intrusive dykes of a variety of rocks occur in the district, all of granitic type, ranging from felsite to aplite (a crystalline, granular admixture of quartz and feldspar). These dykes are not abundant, but are found accompanying all of the principal mineral veins, though also occurring where no veins are found.

The strike of the rocks over twenty square miles of this region is uniformly north and south, the dip being variable though usually nearly vertical. The eastern portion of the area is more gneissoid and massive, and is more largely made up of hornblende rocks than the section in which the veins occur, and to the westward are found heavy beds of limestone conforming to the strike and dip of the schists. Beyond them is found a broad area of syenitic granite. In these western granites are large dykes of rhyolite and vitrophyre, though, as far as observed, none of them have any connection with mineral veins. Ferruginous quartz veins are found in the granites, which contain some gold, but they are uniformly low grade. Still farther to the westward, very large quartz veins are found which are stained with copper carbonate. In the New York mountains, southwest of this district, copper and silver ores are found at and near the contact of limestone and granite, and considerable development has been done on them, but they are now idle. In the limestone near Manvel, three miles from Vanderbilt, is found a quantity of crysocolla in irregular bunches.

In this interesting district is a peculiar vein system, which to the casual observer is complex and puzzling; but, upon platting the several veins, their relations become apparent. There are two main systems, which are 1000 feet apart and nearly parallel. The direction of strike is about N. 55° to 60° W., though this varies somewhat. On the west is the Boomerang system, which comprises one main fissure several thousand feet in length, and striking in the direction indicated, with branches forking out from the main crevice at a low angle on either side of it. In each case these spurs or branches

strike out to the southeastward, there being no branches diverging to the northward. They all contain high-grade ore.

The eastern system is in some respects like the Boomerang system, but with important differences. The main fissure in the latter system is that of the Gold Bronze-Gold Bar vein. The St. George, or Gold Bar, fissure is found on a low ridge near its northern end, and from that point strikes south 63° E. for a distance of 1200 feet, where it sends out a diverging branch, which, sweeping around in a curve, forms the Gold Bronze fissure, the main portion of which strikes nearly east and west. The Gold Bar fissure continues southerly from this point of divergence, but assumes a curving strike and sends out a second and then a third branch, each of which, together with the main or foot wall fissure, has a corresponding curved strike, including between the several veins segments of country rock, having the form of concavo-convex lenses. To the southward of these curving veins is another vein, having no apparent direct connection with the main fissures, but conforming to it in the curving strike, and it may properly be included in the same system. Each of these fissures are also ore-bearing.

Nearly opposite the southeastern end of these two systems of veins, a third system is found, striking nearly at right angles to those described, and forming a connecting link, as it were, between them. This vein has a strike approximately northeast and southwest, and, like those previously described, is the principal vein of a system of fissures, which, also like the others, branch out from the principal vein. These several veins diverge from a point near the southeasterly end of the Boomerang vein.

The whole vein system of the district forms a most interesting study of the dynamic forces which result in the fracturing of rock masses and the formation of mineral veins in which are concentrated large quantities of the sulphides of the base metals, together with gold and silver.

The compressive stress which resulted in a disruption of these rocks has created planes of weakness, into which have been intruded eruptive magmas in the form of dykes. These do not occur in all of the fissures, or, if so, all do not appear at the surface, though possibly they may be found in depth. The principal and most valuable veins, however, are accompanied by dykes of ashy gray colored rock, too much decayed to make its normal condition easily determinable, but which is probably felsite. The character of the mineral veins indicates that the fissures have been the planes of extensive movement, resulting in a crushing of the dyke rocks and the original schists, which they intersect as well. Subsequently the deposition of ore has taken place, though the movement of the rock masses has continued long after the formation of the veins had been completed, as evidenced by the striated surfaces on the walls, the formation of heavy gouge seams and the fracturing of the solid vein materials.

The Gold Bar crevice is well defined and continues for a long distance. It has heavy gouges and clay masses within the limits of the fissured zone, which in places is more than 20 feet wide. The dyke rock is much decomposed and the entire zone shows evidence of extensive movement and crushing force. The ore shoots are lenticular in shape, usually thickest in the center of the mass, thinning toward the outer edges. These shoots have a peculiarity noticed in many veins elsewhere—that of "splicing" or overlapping at the ends. This condition is observable both longitudinally and in depth.

Where these splices occur the walls are usually decomposed, softened and reduced to the condition of a tough clay, which parts from the hanging wall in great slabs, forming dangerous ground to mine, if not properly supported. At these places the clay is often found to contain imbedded angular fragments of quartz and small bunches of sulphide ore. The ore shoots are of good size—12 inches to several feet in width. The minerals are sulphide of iron, lead, zinc and copper. Gold and silver form the principal values, the gold largely predominating. The gangue is quartz.

In a general way this description of the Gold Bar vein will also apply to the Gold Bronze vein and to most of the others in the district which are accompanied by dyke rocks, with the exception of the main fissure of the Boomerang mine. In the Gold Bar and Gold Bronze system the ore shoots form for the most part at the contact of the dyke rock with the schists, but in the Boomerang the ore occurs in a series of lenticular bodies within a dyke of light gray rock. The dyke has a width of 1 to 15 feet, which is fractured by a system of nearly parallel fissures, between which the dyke material has been shattered and pulverized, and in these shattered portions of the dyke the ore shoots have formed, the sulphide minerals and quartz filling interstitial spaces and to some extent also replacing the pulverized dyke material. Ore deposition appears to have resulted in direct proportion to the fissuring and pulverizing of the dyke rock prior to the infiltration of the mineral solutions.

With the narrowing and final discontinuance of the dyke going southeastward, the strength and value of the ore shoot diminish, until at the farthest extent of development nothing remains but a small vein lying at the side of the dyke, where it is but a foot in width. A short distance farther southeast the dyke appears to have disappeared entirely, and in its place is found a vein of barren white quartz, which continues hundreds of feet in the same general direction.

In all of the veins mentioned a good grade of ore has been found, some of it running several hundred dollars per ton. In a number of the smaller veins which are offshoots from the main fissures high grade shipping ores have been mined, and these were extensively worked in the early days of the camp, from 1892 to 1894. The principal mines have passed into the hands of A. G. Campbell of Salt Lake, who has worked first the Boomerang and more recently the Gold Bar-Gold Bronze veins extensively and profitably. W. H. S.

Motive Power at the Mines.

Written for the MINING AND SCIENTIFIC PRESS by A. E. CHODZKO.

The recent fire that destroyed a part of the generating plant at Blue Lakes City, Calaveras county, Cal., thus depriving several neighboring towns and mines of their quota of electric current, affords a timely opportunity for calling attention to the most desirable methods in the production of motive power at a mine, a question to which its success, and often its existence, is intimately connected.

The sudden putting out of the electric lights in a town or in a mine will, in most cases, prove to be a decided if not a serious annoyance; yet, unless in some exceptional cases, such an accident will not, by far, create as grave a situation as would the suspension of hoisting or pumping power in a deep shaft.

The latter has been experienced, to a greater or less degree, by a number of mines along the mother lode during the last two or three dry seasons, and that the lesson has not passed unnoticed by some, at least, of the mine owners of California is evidenced in some recent hoisting installations, where a steam engine has been coupled by a disconnective device to the driving shaft of a hydraulic hoist. A broader view of the situation has even materialized into the organization of a committee of prominent citizens, and a definite programme has already been outlined, tending towards a systematic impounding of waters in the high Sierras for use in dry seasons.

This is an undertaking of considerable magnitude, and which, momentous and extensive as it is, will entail a large amount of preparatory work, followed by legislative action. Its good effects are not, therefore, to be expected in the immediate future.

No intention is here entertained to discuss the requisites of the economical production of motive power. A number of factors of various natures must be considered and combined to arrive, in each particular case, at the solution of this problem. But while no iron rule can be set in the premises, two points at least are pretty generally considered at the present day, as established by experience, namely:

First—That the cost of power per unit is much less in a large plant than it is in a small one—in other words, that the cost of producing 1 H. P. in a 1000 H. P. engine is much less than the cost of producing it in a 1 H. P. engine. This difference is more particularly marked in the case of steam.

Second—That among the several sources of motive power water affords in all respects the most convenient solution of the question, so far as first cost and maintenance of motive machinery are concerned.

The consequences of these facts are that the moderate power consumer, such as is the majority of the mine owners in California, will in many cases have apparently good reasons to buy his power from a large plant, because the first cost of his installation is thus reduced to a minimum, and also because he will have to pay for his power only so long as he actually uses it. A mine which requires a large amount of motive power will more commonly find it advantageous to have its own generating plant, and this will also be the cheapest solution in a very small exploitation.

Besides, since steam and compressed air power distributions at some distance are not to be considered in California, the situation can be summed up in saying that many mines in a given region often depend for their operation on a single water system, or else—and this is more and more the case nowadays—on a single electric plant; and we are now confronted by the fact that either one of these sources of power may find itself unable to meet the wants of the consumers for a more or less protracted period, with the result that what would already be bad enough in one isolated case assumes the proportions of a public calamity, when hundreds, if not thousands, of men are thus thrown suddenly out of employment for weeks or perhaps for months.

What, then, is to be done to prevent occurrences which, as far as water goes, have ceased to be rare exceptions? I have previously mentioned the use of an emergency steam plant, but in many low-grade mines the cost of coal or of firewood is such that working with steam power is hardly, if at all, better than shutting down altogether. Again, the purchase and erection of engines, boilers and transmissions means an immediate expense which in many cases will be prohibitive. It is at least interesting to note that while these difficulties have been making themselves felt of late—to a more marked degree, perhaps, than in previous years—California was slowly but surely, at the very same time, adding, so to speak, a new feather to its cap, and there is nowadays hardly any question but that this privileged land of the gold mine is also a great oil country.

There, in the writer's opinion, lies the salvation from present and future troubles.

The ideal emergency plant, both as to first cost and as to economy in running expenses, must consist of internal combustion engines, using oil, and more especially using crude oil as a source of motive power. No such array of conditions tending to secure economy and convenience can be found with any other kind of motor.

Self-contained engines, requiring a minimum of space and of foundations; no water, except for jacket circulation, and this can easily be saved and used over again; no more complication than in a good steam engine, and minimum of storage space for fuel; running expenses strictly proportional to the actual power developed, and stopping suddenly with the motor itself; absolute absence of danger inherent to the nature of the fuel; even in a rugged country, where transportation is expensive, the oil can be pumped over miles of ridges and canyons through a small-sized pipe, and at very moderate cost, from some accessible place, which in more cases than one will be the nearest railroad station.

Very satisfactory results have been obtained from the use of power plants using gasoline or distillates, and that this class of motors is well adapted to mining work is no longer a matter of doubt. Another step forward must be made, however, if the greatest economy is to be realized, and this will be found in the use of California crude oil, which careful experiments have shown to be very well adapted to that object. It is the writer's belief that a judicious combination of crude oil prime movers and of compressed air in the machinery of a mine will procure a degree of economy and security unattainable under the present conditions of motive power production, and that what was at first termed emergency plant will prove to be, at least in some cases, the cheapest type of permanent power installation.

(*To be Continued.*)

Official Statistics of the World's Gold Production.

The following table shows the gold production of the world from 1873 to 1898, inclusive:

1873	$ 96,200,000	1886	$106,163,900
1874	90,750,000	1887	105,774,900
1875	97,500,000	1888	110,196,100
1876	103,700,000	1889	123,489,200
1877	113,947,200	1890	118,848,700
1878	119,092,800	1891	130,650,000
1879	108,778,800	1892	146,815,100
1880	106,436,800	1893	157,287,600
1881	103,023,100	1894	181,567,800
1882	101,996,600	1895	200,406,000
1883	95,392,000	1896	202,251,600
1884	101,729,600	1897	238,812,000
1885	108,435,600	1898	287,428,600

Mining Summary.

ALASKA.

J. H. Woolery of Ketchikan says that ore from some mines is a clean white quartz, full of fine gold. Other ore is rich in copper and gold.

Cape Nome prospectors have signed a memorial to Congress, asking to have the size of Alaskan placer claims reduced to 500 feet square, and that locating by power of attorney be forbidden.

ARIZONA.

PIMA COUNTY.

H. E. Banes, Supt. Azurite Copper Co., announces that on the 100 level at Shaft No. 2 he has cut an ore body containing copper carbonates that is 32 feet wide.

PINAL COUNTY.

The *Star* reports a strike in the Collins mine, of the Mammoth group; the force will be doubled. A connection will be made from the 700 level of the Mammoth through a body of ore to the Collins mine, and the latter will be worked through the Mammoth shaft. The deepest shaft in the latter will be sunk 200 feet deeper. It has been decided to install an electric power plant on the Aravaipa river, fifteen miles from Mammoth. Sufficient power will be developed to run the mill with additional twenty stamps.

CALIFORNIA.

Amador.

W. Q. Mason and J. Griesbach, owners of the Madrone mine, at Pioneer, are making an upraise from the third level. They have a 2-foot ledge, which averages from $8 to $20 per ton.

Jackson *Dispatch*: Supt. Truscott of the Oneida says grading for the new 60-stamp mill has been completed. The new shaft is down 2020 feet and sinking. The old shaft has been unwatered and repaired to a depth of 100 feet, but it is in a bad condition. No ore is being taken from the mine at present, as it would have to be piled on the dump and handled a second time to get it into the mills. ——A large pump has been put in the Voorlander mine near Middle Bar. The pump is operated by water power and throws 3000 gallons an hour. The shaft has reached a depth of 160 feet and a contract has been let to sink an additional 100 feet.——The Altaite M. Co. has been incorporated to operate the old Mexican mine in Rancheria district, eight miles above Sutter Creek in the east belt. The incorporators are J. B. Francis, L. W. Borger, J. W. Caldwell, R. J. Adams and G. G. Fraser. The capital stock is $100,000, divided into 200,000 shares of the par value of 50 cents a share. The principal place of business will be at Jackson. A great deal of gold, it is said, was taken out of this mine in early times by the Mexicans, the ore being packed on burros to Rancheria creek, where eleven arrastras were in operation.

Butte.

Oroville *Register*: J. B. Watson, Supt. Golden Trout mine, on Feather river near Strawberry, says the stamp mill is crushing six tons of ore a day and that the other ten stamps will be in operation by the 1st of January. They have forty-one men on the payroll. The ledge in one tunnel is 7½ feet wide and 11 feet in the other tunnel.

Calaveras.

The Commodore mine, near San Andreas, is down 300 feet. It has been found necessary to substitute 12x12 timbers in the shaft for the 8x8 heretofore used.

Work has begun on the Shotgun mine, near Demarest, beyond Fourth Crossing. The new shaft is down 35 feet.

Good reports come from Wallace, where drift mining is said to be profitable, and in the mine located in the town rich strikes have been made. The deposits are found under a cap of lava. Dredging is also going on in the river, but little can be done there because of the low stage of the water in the stream.
